TOPIC -----

Is the Apple Scanner software compatible with System 7.0?

DISCUSSION -----

Version 1.0 of the AppleScan application and the Scanner system extension are mostly compatible with System 7. Version 1.0.2 of AppleScan and version 1.0.1 of Scanner are the recommended versions. Users should upgrade to these versions after installing System 7.

Upgrades to these versions are free, and the software is included in the Upgrades folder on the System 7 Information bulletin board. Use BB Pathfinder to locate this bulletin board.

The Apple Scanner is compatible with all Macintosh systems that have a SCSI interface.

TOPIC -----

Is the AppleShare File Server software compatible with System 7?

DISCUSSION -----

No. The AppleShare File Server software version 2.0 is not compatible with System 7 and should not be installed on a System 7-based Macintosh system.

AppleShare is fully network-compatible with both System 6 and System 7. Both System 6 and System 7-based Macintosh users can access an AppleShare File Server running on a System 6-based machine.

AppleShare Server 3.0, which was announced on October 15, 1991, is fully compatible with System 7. For upgrade information, please locate the article titled "AppleShare Server 3.0: Upgrade Information".

## System 7: Upgrade Information for Inter•Poll

Revised: 5/27/93  
Security: Everyone

System 7: Upgrade Information for Inter•Poll

Article Created: 29 May 1991

Article Change History

-----  
05/27/93 - REVIEWED

TOPIC -----

Is Inter•Poll compatible with System 7?

DISCUSSION -----

Yes. Inter•Poll version 1.0 is mostly compatible with System 7, and version 1.0.1 is fully compatible. The update to Inter•Poll is free and the software is posted on AppleLink. Users should upgrade the Inter•Poll software after installing System 7. Inter•Poll will work with both System 7 and System 6 systems over the network.

Inter•Poll will work with both System 7 and System 6 systems over the network. The Responder functionality is now built into System 7, and installing System 7 removes the Responder extension from a System 6 system. If a System 6.0.x Mac is upgraded with System 7 printers drivers, the network administrator using Inter•poll (Apples network administrator software) will get a blank line for that system's LaserWriter driver version number. There is no problem viewing System 7 drivers on System 7.0 Macs. The Sys 6 responder can't read the System 7 driver resources.

System 7.x: Upgrade Information for MacTCP (1/95)

Article Created: 29 May 1991  
Article Reviewed/Updated: 24 January 1995

TOPIC -----

Is MacTCP compatible with System 7 and higher?

DISCUSSION -----

MacTCP is compatible with System 7. The specifics follow:

- For System 7.0 and System 7.0.1, use MacTCP version 1.1 or higher.
- For System 7.1 and System 7 Pro (7.1.1), use MacTCP version 1.1.1 or higher.
- For System 7.1.2 and System 7.5, use MacTCP version 2.0.4 or higher.

Note: The current version of MacTCP is version 2.0.6.

The applications: "MacTCP 2.0.4 to 2.0.6 Patch" and "MacTCP Admin 2.0.6 Patch" are ResCompare resource patching applications. Applying the appropriate patch to a COPY OF YOUR ORIGINAL ("clean") MacTCP or MacTCP Admin control panel will upgrade your copy to version 2.0.6.

All licensed copies of MacTCP 2.0.4 can be upgraded. For users of earlier 2.x versions (2.0 and 2.0.2) must first be updated to version 2.0.4 before updating to version 2.0.6.

System 7: Upgrade Information for Apple Tape Backup 40SC

Article Created: 29 May 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Is the Apple Tape Backup 40SC software compatible with System 7?

DISCUSSION -----

No. The Apple Tape Backup 40SC software and Tape Disk system extension are not compatible with System 7, and no update is planned. Apple recommends the use of third-party backup software for use with the Apple Tape Backup 40SC. (The Apple Tape Backup 40SC hardware is fully compatible with all Macintosh models running System 7.)

Take the following steps to recover system information from tapes generated with the Apple Tape Backup 40SC:

- 1) Use a System 6-based Macintosh to recover the files.
- 2) Use the File Sharing capability of System 7 to transfer the files to the System 7 system.

In the case of a complete hard disk recovery, follow these steps:

- 1) Install System 6 on the hard disk.
- 2) Use Tape Backup 40SC to recover the information.
- 3) Reinstall System 7.

## System 7: Compatibility with Macintosh Software Utilities (8/94)

Revised: 8/23/94  
Security: Everyone

System 7: Compatibility with Macintosh Software Utilities (8/94)

Article Created: 29 May 1991  
Article Reviewed/Updated: 22 August 1994

TOPIC -----

This article describes how System 7 works with some commonly-used Macintosh software.

DISCUSSION -----

The following software is no longer needed because its functionality has been incorporated into System 7:

800K Eject INIT  
Font/DA Mover  
Memory Manager INIT  
TrueType INIT

The following software is incompatible with System 7 and no update is planned. Users of this software should purchase third-party equivalents.

HD Backup  
MacroMaker

The following software is incompatible with System 7, but compatible versions are included with the System 7 Personal Upgrade Kit:

|                          |                                                                         |
|--------------------------|-------------------------------------------------------------------------|
| Apple File Exchange      | (prior to 7.0)                                                          |
| Disk First Aid           | (prior to 1.5)                                                          |
| LaserWriter Font Utility | (prior to 6.0; this program has been supplanted by LaserWriter Utility) |
| TeachText                | (prior to 7.0)                                                          |

The following software is incompatible with System 7. Compatible versions are supplied with the System 7 Group Upgrade Kit, and are also posted in the Upgrade

folder on the System 7 Information bulletin board:

|              |                                                                                                    |
|--------------|----------------------------------------------------------------------------------------------------|
| QuickMount   | (prior to 1.0.7)                                                                                   |
| Apple CD-ROM | (prior to 3.0)                                                                                     |
| The Namer    | (prior to 2.1; the functionality of this<br>program has been supplanted by LaserWriter<br>Utility) |

## System 7: Specifications (9/95)

Revised: 9/8/95  
Security: Everyone

System 7: Specifications (9/95)

=====  
Article Created: 13 May 1991  
Article Reviewed/Updated: 8 September 1995

TOPIC -----

This article contains some specifications of Macintosh System 7.

DISCUSSION -----

### Built-in Fonts

-----  
Two types of fonts are supplied with System 7: TrueType and bitmapped.

TrueType fonts include:

- Times (plain, bold, italic, and bold italic)
- Helvetica (plain and bold)
- Symbol
- Courier (plain and bold)
- Chicago
- New York
- Monaco
- Geneva

### Print Drivers

-----  
The following print drivers are included with System 7

- ImageWriter and AppleTalk ImageWriter
- LaserWriter
- Personal LaserWriter LS
- Personal LaserWriter SC
- ImageWriter LQ and AppleTalk ImageWriter LQ
- StyleWriter

### Networking Capabilities

-----  
With System 7, the AppleTalk network system supports LocalTalk, Ethernet (EtherTalk), or Token Ring (TokenTalk). Over 16 million nodes per network

are provided for with AppleTalk Phase II networking. Using Macintosh file sharing, up to 10 folders per machine can be shared, each having an unlimited number of enclosed folders. Up to 10 guest users can be connected to a networked hard disk, with up to 50 guest users identified in the Users and Groups file. User management is built into the software to allow entry of user names, passwords, group memberships, and access privileges for opening and modifying files.

#### Memory and Storage

With 24-bit addressing, up to 8MB of physical memory can be accessed and up to 14MB of memory can be accessed with virtual memory, depending on which model Macintosh is being used. With 32-bit addressing, 1 gigabyte of physical memory is accessible (without taking into account the hardware limitations) and up to 1 gigabyte of virtual memory is accessible.

A minimum of 2MB of RAM is required to run System Software Version 7.0. The amount of memory used by System 7 alone (without any additional third party software) is 1MB to 1.25MB, depending on configuration.

Approximately 2.5MB to 4MB of disk space is consumed by System 7, depending on configuration.

#### Compatibility

System 7 is compatible with most Macintosh System 6 applications. The processor is compatible with 68000, 68020, and 68030 microprocessors, 68851 Paged Memory Management Unit (PMMU), and 68881 and 68882 floating-point units (FPUs).

#### Disk Formats

The following disk formats are supported by System 7: 400K, 800K, 1.4MB Macintosh disks, 720K and 1.44MB read/write MS-DOS or OS/2.

#### Files and Volumes

Up to 31 characters with mixed case, spaces, and symbols are allowed with System 7's file naming conventions.

Maximum file and volume size is 2 gigabytes. The maximum number of files per volume is 65,536.

The maximum number of volumes open at once as well as the maximum number of tasks supported are limited only by the amount of available system memory.

#### Sound

Sound can be played from disk and input to disk. The maximum number of simultaneous sound channels is 4.

## HyperCard: How to Control Which Version Gets Launched

Revised: 6/21/91  
Security: Everyone

HyperCard: How to Control Which Version Gets Launched

=====

Article Created: 1 April 1991  
Article Last Reviewed: 5 June 1992  
Article Last Updated:

TOPIC -----

I have HyperCard 2.0 and HyperCard 1.2.5 on the same AppleShare server. When I double-click on a HyperCard stack, sometimes I want HyperCard 2.0 to launch, sometimes I want HyperCard 1.2.5 to launch.

How can I control which version of HyperCard is launched?

DISCUSSION -----

On your personal computer, if two applications differ only in their version numbers, then the last copy installed is the one that gets launched. However, this rule doesn't apply to applications on an AppleShare volume.

A sure way to eliminate the version (or last-installed) confusion is to change the Creator of the applications you don't want to launch.

For example, use ResEdit to change the Creator of HyperCard from "WILD" to "FRED". When you double-click on a stack, the system looks for the application whose creator matches the creator of the document or stack. If you have another copy of HyperCard (say, 2.0v2) on a mounted device, it will be launched. Saving files from the changed application is unaffected (they still have "WILD" for their creator).

Change the creator of all non-current HyperCard applications to something other than "WILD" (try "DLIW"; it's probably not used by other applications). All stacks launched will come up in HyperCard 2.0v2. To open the stacks in other versions, launch the desired application and use "Open..." in the file menu.

## System 6.0.7: Installing Comm Toolbox

Revised: 6/21/91  
Security: Everyone

System 6.0.7: Installing Comm Toolbox

Article Created: 16 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I want to install MacTerminal 3.0 on a Macintosh LC. Unfortunately, MacTerminal 3.0 has to have certain Comm Toolbox resources into the System file. This means I have to restart from the original Installer disk, which happens to be System 6.0.5, a System that doesn't work on Macintosh LC.

I've tried to upgrade the installer disk to System 6.0.7. When I start the Macintosh LC and try to execute the installer script, the computer asks for the "Communications 1" disk. All I can find is a disk called "Communications", not "Communications 1".

DISCUSSION -----

The Communications Toolbox installation diskette that ships with MacTerminal is named "Communications". An essentially identical diskette shipped with the Macintosh Communications Toolbox package is named "Communications 1."

The Communications Toolbox 1.0 Installer Script on both diskettes (and the 6.0.7 Network Product Installer) asks you to insert the diskette "Communications 1", but you may use either diskette. Updating the CTB Installation diskette to version 6.0.7 has no effect on the resources and their locations called for by the installation script.

There isn't enough room on the CTB installation disk to conveniently update it to System 6.0.7 using the script "minimal software for any Macintosh". Many people choose to install minimal software for a specific Macintosh. An alternative is to not update the CTB installation diskette to System 6.0.7 but instead start the Macintosh with another diskette containing System Software 6.0.7. Then insert the CTB installation diskette

and run the installer.

Another possibility is to get the 6.0.7 Network Products Installer off AppleLink. Use the BB Pathfinder and search on "Software and 6.0.7".

## LaserWriter IINTX: Benefits of Attached Hard Drive

Revised: 7/16/91  
Security: Everyone

LaserWriter IINTX: Benefits of Attached Hard Drive

=====

Article Created: 16 April 1991  
Article Last Reviewed: 16 July 1991  
Article Last Updated: 16 July 1991

TOPIC -----

What are the benefits of using an attached hard drive with a LaserWriter IINTX?

- 1) Is the purpose of a hard drive to:
  - A. increase printing speed through RAM caching?
  - B. centrally locate PostScript fonts?
  - C. to free up space on a local hard drive?
  - D. all the above?
- 2) Currently, TrueType fonts cannot be downloaded to a hard drive connected to a LaserWriter IINTX. Will this feature be used in the future and will you gain any benefit by loading TrueType fonts onto a hard drive connected to a LaserWriter IINTX?

DISCUSSION -----

The purpose of a hard drive is primarily to centrally locate PostScript fonts and to free up space on a local hard drive, but can be all of the above.

A hard disk attached to a LaserWriter IINTX speeds printing only if the fonts required for a document are stored on it and thus do not need to be downloaded over a network. Other uses generally slow down printing unless the hard disk speed versus the network speed is appreciably different. For example, if font scan-conversion (idle-time or otherwise) stores its cache to the hard disk, printing is slowed because it takes time to retrieve the cache from disk. An extremely fast disk may overcome this problem, but we haven't performed any tests that clearly prove this.

Choice B, centrally locating PostScript fonts, is a valid use, and can speed up printing if those fonts are used in the document in question.

Choice C, freeing up local hard disk space, is also valid because every PostScript font located on the hard disk need not be located on the user's hard disk. Therefore the fonts can be removed from the user's hard disk, freeing up storage space. Of course, a backup of these fonts should be kept somewhere in case the LaserWriter IINTX's hard disk ever fails.

Another way to improve the printing speed of a LaserWriter IINTX, or any PostScript LaserWriter for that matter, is to download fonts using the LaserWriter Font Utility. If there is adequate RAM (or disk space) available, downloading the fonts can greatly increase print speed. And fonts downloaded to RAM are faster than those downloaded to disk, so optimum performance depends on what fonts are used most often and where they are stored.

The difference between using the Font Utility to download fonts versus allowing them to be automatically downloaded with your document is that those fonts downloaded with the utility will persist until the printer is reset or powered off. Those fonts that are downloaded automatically with a document only persist for that job. The next job requiring the same fonts would download them again. This increases network traffic and job overhead appreciably, and with a busy network, can slow printing significantly.

Similar issues are involved with TrueType fonts. With current LaserWriter models, the TrueType fonts and rasterizer are not available in ROM. Therefore, all TrueType fonts used in a document must be downloaded, along with the rasterizer. These fonts and their scan converted data will only be persistent for each job, so the effect will be nearly identical to that with PostScript fonts downloaded from a user's System Folder. The LaserWriter Font Utility, version 7.0, is able to download TrueType fonts as well as PostScript fonts.

## LaserWriter and WordPerfect: Correcting Timeout Problem

Revised: 6/21/91  
Security: Everyone

LaserWriter and WordPerfect: Correcting Timeout Problem

=====

Article Created: 16 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I'm printing a WordPerfect document from a DOS machine using a LaserWriter IINT. After the first 40 pages have printed, the document no longer prints and junk comes out on the paper. No matter where I start, the printing never goes beyond 40 good pages.

DISCUSSION -----

After limited testing, it appears that WordPerfect takes a long time to repaginate lengthy documents during printing. This creates a time lag that can exceed AppleShare PC's timeout for printer connections and causes the job to fail. Symptoms are seen as pauses between pages that wouldn't seem to warrant any additional computation. If one of these pauses is long enough, it causes AppleShare PC to terminate its connection with the LaserWriter.

Try increasing the timeout value used in AppleShare PC's DA program at connection time. If increasing the timeout value helps but does not solve the problem, leave the timeout value blank. This can delay other users from accessing the LaserWriter, but not too badly.

## Macintosh IIsi: Sound Driver Incompatibilities and CE QuickMail

Revised: 7/28/92  
Security: Everyone

Macintosh IIsi: Sound Driver Incompatibilities and CE QuickMail

=====

Article Created: 16 April 1991  
Article Last Reviewed: 15 July 1992  
Article Last Updated: 28 July 1992

TOPIC -----

I'm having problems using CE QuickMail's voicemail on a Macintosh IIsi. I can send voice messages only to other Macintosh IIsi computers. No other Macintosh computers can play my messages.

DISCUSSION -----

The problem is that QuickMail requires a compatible sound driver on every Macintosh, but the drivers on your network may be different on each Macintosh. On a Macintosh IIsi or Macintosh LC, QuickMail uses the Apple Sound Manager in System 6.0.7. On other Macintosh models using Farallon's MacRecorder, QuickMail uses Farallon's sound driver. And while the Sound Manager understands the new AIFF format sounds, as well as the older 'snd' resource format sounds, older versions of Farallon's driver did not understand the AIFF format.

When a Macintosh IIsi records a sound (using the Sound Manager), the sound is stored internally in AIFF format. Other Macintosh IIsi users can play the sound because they're using the same sound manager. Macintosh computers using the MacRecorder and earlier versions of the Farallon sound driver can't play the message.

You can either install a Farallon sound driver on all your Macintosh IIsi systems or get an upgrade. Farallon has sold the MacRecorder hardware and software to MacroMedia (formerly MacroMind) and they're handling support for the product.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

## A/UX: How To Turn On IP Forwarding (8/94)

Revised: 8/25/94  
Security: Everyone

A/UX: How To Turn On IP Forwarding (8/94)

Article Created: 17 April 1991  
Article Reviewed/Updated: 24 August 1994

TOPIC -----

I just discovered that A/UX defaults IP forwarding to OFF. This means that an A/UX system with more than one interface no longer "knows" how to route IP traffic regardless of how in.routed is configured.

DISCUSSION -----

To enable forwarding, run adb on the kernel. Log in and type the following command:

```
# adb -w -k /unix /dev/kmem
```

```
a.out file = /unix (COFF format)
core file = /dev/kmem
ready
```

```
ipforwarding?D
```

```
ipforwarding: 0
```

```
ipforwarding?W 1
```

```
ipforwarding: 0x0 = 0x1
```

```
$w
$q
#
```

This changes the "ipforwarding" constant in the kernel. Reboot, and when the system comes back up, IP forwarding will be on.

For more details on IP forwarding refer to the A/UX Network System

# ..TIL07155-A-UX-How\_To\_Turn\_On\_IP\_Forwarding\_8-94\_(TA45572).pdf

Apple CD-ROM Explorer Disk: Using with Macintosh IIsi

=====

Article Created: 17 April 1991  
Article Last Reviewed: 15 July 1992  
Article Last Updated: 29 July 1992

TOPIC -----

I have a Macintosh IIsi with the 12-inch RGB display and an AppleCD SC. The problem is my CD-ROM Explorer disk included with my AppleCD SC was designed for a 13-inch RGB monitor. Also, the HyperCard stacks on the CD-ROM Explorer are incompatible with HyperCard 2.0, the version required when using 6.0.7 system software.

My questions are:

- 1) Is Apple going to revise the CD-ROM Explorer disk?
- 2) If yes, what is the upgrade policy and how do I get a copy?

DISCUSSION -----

The CD-ROM Explorer HyperCard stacks are compatible with HyperCard 1.2.5 and HyperCard 2.0 under Macintosh System Software 6.0.7.

As of July 1992, the CD-ROM Explorer disk is no longer included with Apple CD-ROM drives.

Apple Sound Chip: Macintosh IIfx Audio Output Level (4/95)

=====

Article Created: 5 March 1991  
Article Reviewed/Updated: 26 April 1995

TOPIC -----

I am trying to match up line levels for my audio system and I need to know the audio output level of the Macintosh IIfx. This information is not in the Macintosh IIfx manual.

DISCUSSION -----

The following information is from the "Guide to the Macintosh Family Hardware" available through Addison-Wesley dealers. This information applies to all models using the Apple Sound Chip.

"The external sound jack is at standard line level (approximately 1.5 volts peak-to-peak) and its source impedance is approximately 47 ohms. The jack is capable of driving a headphone load of 8 to 600 ohms, or the input to almost any audio amplifier or amplified speakers. It will not adequately drive a directly connected external speaker. The external sound jack is short-circuit protected."

Print Shop 1.1: Fixes 1MB Apple IIGS Incompatibility

=====

Article Created: 5 March 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I'm using Broderbund's "Print Shop" on an Apple IIGS with 1MB built into the motherboard. When starting the program, I see a line of hex codes on the screen, then loading stops. The same disks work fine with the versions of Apple IIGS with 256K RAM on the motherboard and a 512K memory expansion card in the slot.

DISCUSSION -----

Broderbund has released version 1.1 of their Print Shop software that is compatible with version 3.0 of the Apple IIGS ROMs. Customers should contact Broderbund's customer service group for upgrade information.

HyperCard 2.0: How To Get Updates

=====

Article Created: 5 March 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

There are several commercial stacks shipping that require HyperCard 2.0 v1, HyperCard 2.0 v2, and so on. I want to use these stacks but don't want to necessarily buy a full HyperCard bundle from Claris. Is there a way for me to get an update from Apple, or must I purchase HyperCard from Claris to get an update?

DISCUSSION -----

HyperCard is a Claris product, and customers should contact them regarding software updates. Claris will send a disk containing HyperCard 2.0v2, HyperCard Fonts, and a small Home stack to any owner who requests it.

Customers who purchased the Software Update package for HyperCard or the Network Admin package will be shipped the same software Apple is including with its computers.

Claris says that the HyperCard 2.0 upgrade is the best way to go. The upgrade includes the new Script Language Guide, a guide to the new features, and the complete set of HyperCard disks.

## HyperCard 2.0: Command-Option-S Key Problem

Revised: 6/21/91  
Security: Everyone

HyperCard 2.0: "Command-Option-S" Key Problem

=====

Article Created: 5 March 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

In HyperCard 2.0, the Command-Option-S key combination brings up a dialog box requesting the location of the System folder, rather than the stack script as expected.

DISCUSSION -----

Command-Option-S opens the script of the stack in use. This did not change in HyperCard 2.0. You might have a macro set up to do something different. In QuicKeys 2, Command-Option-S is set up as the start/stop sequence for macro recording. Make sure that nothing like this is in use and the problem should be eliminated.

HyperCard 2.0: Version Numbers Explained (2/95)

Article Created: 5 March 1991  
Article Reviewed/Updated: 22 February 1995

TOPIC -----

How do I know if I have the latest released version of HyperCard 2.0? Is there a way to get that information other than using the "Get Info" command?

DISCUSSION -----

The latest released version of HyperCard is 2.2. This is the version returned by the Get Info command. The "version" property of HyperCard returns version information on the HyperCard application and stacks. On pages 645 to 647 of, "HyperTalk 2.0: The Book", by Dan Winkler and Scot Kamins, is an excellent description of the property and the information it returns. However, Claris Corporation uses a different numbering scheme for release versions of its software.

Running HyperCard 2.2, type "put the long version". The string "02218000" appears in the message box.

- The first two digits (02) show major revision number.
- The next digit (2) is for minor revisions.
- The fourth digit (1) is for bug fix revisions.
- The next two digits (80) show the development stage. In this case, the 80 means it is released software.
- The final digits (00) are only applicable on unreleased software.

Translating all of this using the Apple scheme results in 2.2.1. Claris uses only the major and minor revision number in its releases. The bug fix revision number translates to a "v" number with 0 being equivalent to "v1", 1 to "v2", and so on.

## LocalTalk PC Card: Where To Get Interface Specifications

Revised: 6/21/91  
Security: Everyone

LocalTalk PC Card: Where To Get Interface Specifications

=====

Article Created: March 9, 1991  
Article Reviewed Only:  
Article Last Updated:

TOPIC -----

I want to develop a server program on a PC. To do this, I suppose I'll need to get the hardware and software interface specifications for the LocalTalk PC card. Where can I get them?

DISCUSSION -----

You may not need to get down to the hardware level. You may be better off basing your software on an existing model, such as the Open Data-Link Interface (ODI) specification. This way, you wouldn't have to adjust for each type of network card, but could work with a single model. Also, you'll save much development time by using ODI-compliant drivers already in use for many network cards. Your software could then coexist with other software that uses ODI protocol stacks--AppleShare PC, for example.

Since an ODI-based driver already exists for the LocalTalk PC Card, you could concentrate on developing your server software and basing it on the available AppleTalk protocol stack. If you want to implement a different protocol stack for the LocalTalk PC card, this also can be done within the framework of ODI, and it would still take advantage of the existing driver.

The best source of information on programming to the ODI specification is the Open Data-Link Interface Developer's Guide, available from APDA. Here is the introduction to Chapter 1:

"The Open Data-Link Interface is a new system jointly developed by Apple Computer, Inc., and Novell, Inc., that provides unmatched flexibility for both network developers and end users. The Open Data-Link Interface (ODI) includes the Multiple Link Interface (MLI) and the Multiple Protocol

Interface (MPI). The MLI and MPI are the interfaces for network card drivers and protocol stacks to the Link Support Layer (LSL). The LSL provides packet transfer between these interfaces in a way that allows different protocol stacks to use link-level drivers interchangeably and simultaneously. The ODI puts an end to the need for one-driver to one-stack communication."

The entire publication includes the Developer's Guide, some sample driver notes, and a disk with code and test programs. It is available from APDA as part number M0355LL/A.

## DAL: Rdb Support and CPU Overhead Questions

Revised: 6/21/91  
Security: Everyone

DAL: Rdb Support and CPU Overhead Questions

=====

Article Created: March 9, 1991  
Article Reviewed Only: 9 July 1992  
Article Last Updated: 9 July 1992

### TOPIC -----

- 1) Can I access multiple Rdb/VMS databases (not just tables within a database) simultaneously with DAL?
- 2) Approximately how much CPU power does DAL use?

### DISCUSSION -----

#### 1) Multiple Databases

-----

Let's go over the terminology used by Rdb/VMS as compared to parallel terminology often used in discussions of relational theory:

| Rdb/VMS Term     | Relational Technology Term |
|------------------|----------------------------|
| -----            | -----                      |
| Relation         | Table                      |
| Record           | Row (Tuple)                |
| Field            | Column (Attribute)         |
| System relations | Metadata                   |

In Rdb/VMS, you can choose to store relations (tables) in a single file or in separate files. A database that stores relations in one file with file type RDB is a single-file database. You can also have a database in which all metadata and system information are stored in a root file (file type RDB) and the data are stored in one or more storage area files (default file type RDA). You can place each relation in a separate file, several relations in one file, or several relations in separate files. A database with a root file and one or more storage area is a multifile database.

As you can see, each database can store one or more relations (tables) in

one or more files.

Data Access Language will open more than one database using the OPEN dbbrand DATABASE "databasename"statement or command. For example:

```
open rdb database "daldemo"
```

will open the "daldemo" database that contains one or more tables.

You can use another OPEN rdb DATABASE to open a new database. The newly opened database becomes the default database for the session. This means all subsequent unqualified table references refer to this database. You can, however, use the USE DATABASE dbalias to establish a previously-opened database as the current default database. Each Open Database statement requires a USE LOCATION statement if the Rdb databases are not all in the same location.

## 2) CPU Use

-----  
There are no rough figures on how much CPU power DAL uses because many factors affect the performance of the system. In theory, DAL overhead should be minimum compared to one imposed by the DBMS. If you monitor top CPU usage on the VAX, you will notice that percentage used by DAL server is quite low.

HP Terminal Emulators: Printing on Host Printers

=====  
  
Article Created: March 9, 1991  
Article Reviewed Only:  
Article Last Updated:

### TOPIC -----

Is there a Macintosh terminal emulator that allows file transfer and printing from an HP3000? I've found some information about Session and Reflection 3 PLUS, but there's no mention of printing.

I've also read that Tymlabs, publishers of the Sessions series of terminal emulators, now supports Ethernet. Will using Ethernet allow better connectivity?

### DISCUSSION -----

To our knowledge, no terminal emulation package for HP computers has a specific feature to print directly to an HP3000's printers. You'll have to use the file transfer feature to transfer the text file to the HP3000 and print from there. Walker, Richer & Quinn Inc., the maker of Reflection 3 PLUS, says that you can automate this process using their scripting language. Tymlabs Corporation, the maker of Session, said that version 4.0, has scripts for printing on the host printer.

Ethernet's high transmission speed (10 megabits per second) is particularly useful when there is heavy use of a file server. Examples include multi-user database use, primary storage use for all applications, or for applications development with shared libraries on the file server.

## Macintosh/VAX Integration: Queue & Bridge Questions (11/94)

Revised: 11/7/94  
Security: Everyone

Macintosh/VAX Integration: Queue & Bridge Questions (11/94)

=====

Article Created: March 9, 1991  
Article Reviewed/Updated: 07 November 1994

TOPIC -----

A law firm has VAX computer where 90% of the firm's 350 users have terminals and some Intel-based PCs. The VAX is the hub of the entire operation.

All printing is through the print Queue mechanism on the VAX. The VAX handles forty HP LaserJet clones with PCL as the communication mechanism from the queue to the printer. The printers are serially connected with terminal servers.

- 1) Is there a product that allows the Macintosh to access these print queues using PCL, or does this have to be done through PostScript?
- 2) Remote access to this system is through VitaLink bridges. Has any headway been made to incorporate AppleTalk into these bridges? All VAX resources are on one side of the bridge, so this would eliminate DECnet encapsulation. Any ideas?

DISCUSSION -----

- 1) We are not aware of any product that will do what you are looking for. To do this, the product must supply a receiver process on the VAX, which will act like a LaserJet printer and register its name on the network for users to choose from. Once a PCL print job is sent from the Macintosh, the receiver reads the LaserJet PCL format file and stores it as a standard VAX/VMS text file to be sent to the print queueing system. A print symbiont will take standard VMS text files and convert them to PCL format before they can be forwarded to the LaserJets. The symbiont translator is normally driven by a set of Device Control Library (DEVLIB) modules. Theoretically, one can write a Device Control Library module to translate file to PCLs.

Macintosh to VAX integration product such as PATHWORKS for Macintosh and Alisa use this above approach to get PostScript files to the VAX queue and then print on the Apple LaserWriters on LocalTalk or Digital PostScript printers on the network. Of course, the printers have to support PostScript. One way to allow printing on PCL-based printers is to write a Device Control Library module mentioned above to translate from PostScript to PCL. This is not a trivial task.

In your situation, the easiest way, though not a seamless integration, is to send the text files to the printer device captured by the VMS print queue. These are the terminal server port names in your case. On VAX/VMS, once a terminal port or a terminal server port is captured by a queue, any file sent to the port directly will be queued. The file can be sent by NetCopy application over DECnet, specifying the destination node name followed by the terminal port name, such as YOURNODE::LTA12:, where LTA12 is the terminal server port connected to the LaserJet. You might want to check if the port protection is world write-able. Doing this way, there is no change required in their current PCL-based printer queues.

2. In theory, bridges will pass all protocols on the network unless you program them to filter a particular protocol. To our knowledge, the VitaLink bridge should pass AppleTalk protocol. You should check with Network Systems (formerly VitaLink) for the correct hardware and software version, and correct configuration to pass AppleTalk protocol.

MacTerminal 3.0: Block Cursor Disappears on Macintosh LC

=====

Article Created: March 9, 1991  
Article Reviewed Only:  
Article Last Updated:

TOPIC -----

I'm using MacTerminal 3.0 on a Macintosh LC with System 6.0.7. My block cursor disappears off the screen when logged onto the VAX using VT320 emulation. I have to go into the terminal settings dialog to get the cursor to show up again.

Are there any compatibility problems with MacTerminal and the Macintosh LC?

DISCUSSION -----

We tried both the LAT Tool over Ethernet and the Serial Tool to the VAX, but were unable to duplicate the problem. We don't know which Connection Tool you're using, but here are a few suggestions:

- 1) Throw away the old system file and reinstall it.
- 2) Throw away the Communications folder, reinstall the CommToolBox and its Tools from a known good copy of the diskette.
- 3) Make sure that you don't have any other INITs/CDEVs in the system that may conflict.
- 4) We have heard that some network devices that provide serial look-alike drives are having problems with the CommToolBox. If you're using one of these drivers, remove it and try MacTerminal again.

## AppleTalk Phase II: Issues with FDDI Are Resolved (7/96)

Revised: 7/5/96  
Security: Everyone

AppleTalk Phase II: Issues with FDDI Are Resolved (7/96)

=====

Article Created: 17 March 1991  
Article Reviewed/Updated: 5 July 1996

TOPIC -----

Is there an issue with AppleTalk Phase 2 and FDDI?

DISCUSSION -----

The IEEE 802.1h is the formal standard for AppleTalk and FDDI. Below are four third-party vendors which support this standard:

- UB Networks' current products supports the 802.1h standard. Users should contact them regarding their bridges and for upgraded information.
- 3Com Corporation's LANplex bridge supports the 802.1h standard and AppleTalk. For more information see the following web page:

<http://www.3com.com/cgi-bin/mfs/01/0files/products/dsheets/lpfamspc.html>

- Kalpana's EtherSwitch supports 802.1h.
- Grand Junction's FastSwitch supports 802.1h.

We believe there are other bridges that support 802.h as well.

Below Is Information Outlining Issue Before The IEEE 802.1h Was Set

-----

First, some background:

AppleTalk Phase 2 packets crossing a transparent FDDI bridge are translated into Ethernet-style packets. If these packets translate incorrectly, the bridged Ethernet segments can't communicate with each other over EtherTalk Phase 2. This problem relates to the way vendors implement the OUI 0000 (organizational unique identifier) in the 802 SNAP header.

Some bridge vendors base their products on the IEEE 802.1 standard. However, there are questions about how the standard handles translating "all zeros" in the OUI field of an 802.2 SNAP header.

The problem has to do with the way Apple implements AARP in SNAP in AppleTalk Phase 2. The 802.1 specification says that all SNAP PDUs need a 40-bit protocol identifier. The first 24 bits are unique organizational identifiers assigned by the IEEE; the remaining 16 bits are administered by the assignee:

Begin\_Graphic

| UI   |      |      |      | Assignee Administered |  |      |      |      |      |      |
|------|------|------|------|-----------------------|--|------|------|------|------|------|
| 0011 | 0101 | 0111 | 1011 | 0001                  |  | 0010 | 0000 | 0000 | 0000 | 0001 |
|      |      |      |      |                       |  |      |      |      |      |      |
| lsb  | msb  |      |      |                       |  |      |      |      |      |      |

Apple's assigned identifier is      08    00    07  
                                         1000 0000 0111  
         network bit order 0001 0000 1110

IEEE 802.1 states that:            ||  
                                         ||  
                                         MX

M = 0: (M=1 is reserved)  
X = 0: Globally Administered Protocol Identifier  
X = 1: Locally Administered Protocol Identifier

End\_Graphic

For all AppleTalk protocols, Apple uses the identifier 08007809B. But for AARP, Apple uses 00000080F3. This is really where the problem begins--in the use of OUI 00000.

Because Apple uses 0000 as a UI, there are conflicts with FDDI-Ethernet bridges that also use the same UI to recognize and translate Ethernet-style packets. The question is: who's right--Apple, the vendor, or both?

The all-zero OUI was not intended to be used for translating Ethernet frames to 802.2/SNAP. Its original intention was (and is) not completely clear; all that was agreed upon was:

- 1) The low-order 16 bits of the SNAP protocol discriminator indicated an Ethernet protocol type; and
- 2) The format of the data part of the SNAP packet was the same as the format of the data part of the Ethernet packet of this protocol type.

This "general agreement," was never written down--AppleTalk Phase 2 and TCP/IP just adopted it. Unfortunately, on an Ethernet/802.3 data link, AppleTalk Phase 2 runs on top of 802.3 (and 802.2) and TCP/IP runs on top of Ethernet. Thus, when TCP/IP Ethernet nodes communicate with TCP/IP 802.2 nodes (on token ring or FDDI, say) some type of packet translation must occur. But AppleTalk Phase 2

Ethernet nodes communicating with AppleTalk Phase 2 802.2 nodes (on Ethernet, token ring or FDDI) MUST NOT have any translation done.

This is why it's not so simple to build a bridge that "transparently" allows both forms of communication. What's needed is a bridge with a small Ethernet protocol translation table. The smaller the table, the less translation that happens, and the better the bridge's performance. Any bridge between Ethernet and 802 media that does not translate OUI zero packets prevents TCP/IP nodes (and any others using the same OUI convention) from communicating between the two media. Any bridge between Ethernet and an 802 media that translates all OUI zero packets prevents AppleTalk nodes (and any others with an OUI of zero who don't expect translation) from communicating between the two media. In both cases, routers can, of course, be set up to communicate.

A similar problem happens if two bridges connect two Ethernet/802.3 data links across an 802 backbone (say FDDI). In this case, some type of translation/encapsulation of Ethernet (non-802.3) packets must happen so they can pass across the 802 backbone. There are many ways to do this, one of which is to translate all Ethernet packets to OUI zero packets, shipping them across the backbone, and then converting them back. This, however, does not work for any OUI zero packets that start out on the Ethernet/802.3 data link. Such packets will not be translated on the way into the backbone but will be incorrectly translated before being delivered on the destination Ethernet. Such packets should be forwarded entirely without translation.

In terms of actual product implementations, unfortunately DEC is already shipping an Ethernet-to-FDDI bridge (LanBridge 500) that translates all OUI zero packets, and thus does not work with AppleTalk Phase 2. DEC is aware of this issue. At the recent 802 meetings in Denver, it was clear that this type of translation is not part of the 802.1d (Mac Bridging) standard, but is something that many bridge manufacturers wish to include as a non-802-standard option with their products. Most have said they will have some type of translation (or non-translation) table to insure it is possible to work with all known protocols.

#### Current Status:

At a recent IEEE 802.1 meeting, there was agreement about the translation of Ethernet-like packets from an FDDI backbone to an Ethernet segment. The creation of a new OUI for Ethernet (non 802.3) packets will be required. The Bridge translation decision from an FDDI backbone to Ethernet segment will be as follows:

If OUI = NEW, then translate back to Ethernet (e.g., Phase 1 EtherTalk) Otherwise if (OUI=0 and TYPE=80F3 or other defined types do NOT translate), Do not translate (e.g., Phase 2 EtherTalk AARP)

Apple and DEC were major sponsors of this proposal, and DEC has agreed to make changes to their bridges. This means is that EtherTalk Phase 2 AppleTalk end nodes will work correctly (without modification to the end nodes), when transversing an Ethernet/FDDI bridge. Furthermore, EtherTalk phase 1 end nodes will also work using the new OUI translation scheme.

The IEEE 802.1 committee is currently formalizing the use of OUI in Ethernet to FDDI bridges that will define what to do if a bridge encounters SNAP headers with OUI=0.

## Macintosh to NetFrame Server Connectivity (11/94)

Revised: 11/7/94  
Security: Everyone

Macintosh to NetFrame Server Connectivity (11/94)

Article Created: March 11, 1991  
Article Reviewed/Updated: 07 November 1994

TOPIC -----

What are NetFrame servers and how do I connect to them?

DISCUSSION -----

NetFrame Servers are Intel 386- or 486-based and run either Novell Netware version 2.15 or the OS/2 LAN Manager.

If you're trying to connect a Macintosh to a server running Novell, use Novell's MacVAP and Netware. If the server is running OS/2 LAN Manager, you can only transfer files using SMB File Transfer. Another option is to use Miramar MacLAN Connect and access it as an AFP Server.

There might be a problem trying to connect to the server using MacTCP. The system allows up to eight LAN adapters (Ethernet or Token Ring) for network throughput. The problem is network addresses use a single host name and MacTCP cannot handle multiple addresses returned from a single host.

For more information, search on "NetFrame"

## TokenTalk: How To Find Burned-In Address

Revised: 6/21/91  
Security: Everyone

TokenTalk: How To Find "Burned-In" Address

=====

Article Created: March 9, 1991  
Article Reviewed Only:  
Article Last Updated:

TOPIC -----

How can I find out what the "burned-in" address is for my TokenTalk Card?

DISCUSSION -----

Although you can find out what the "burned-in" address is using the MacDFT Config CDEV, there are times when you don't have this handy.

When holding the card, port to the right and the chip set facing you, look for the ROM card (the card on the card). Now look for the serial number of the card. It is printed on a label two chips to the left of the ROM card on the second row from the top. It is proceeded with S/N.

Once you have found this decimal number, convert it to hex. Now add the result (in hex) to 5000E0000000. This will be your address.

For example:

If your card's serial number is: 1969 (with a bunch of leading zeros)

1969 base 10 = 7B1 hex

5000E0000000 + 7B1 = 5000E00007B1 <= your address.

Apple Coax/Twinax Card: Rev B Fixes MacDFT & Video Problems

=====

Article Created: March 9, 1991  
Article Reviewed Only:  
Article Last Updated:

TOPIC -----

What does the "new" Apple Coax/Twinax card revision do? Who needs it?

DISCUSSION -----

The new Apple Coax/Twinax card offers no new functionality, but it does resolve a somewhat rare incompatibility problem with the Macintosh Display Card 8•24 and Macintosh Display Card 8•24 GC. The only difference between this "new" card and the "old" one is that the inductor/ferrite bead replaces a jumper wire, and the masking on the board says that the board is revision "B."

You should consider upgrading to the new cards if you have the following problem:

MacDFT hangs on boot when the initial "splash screen" appears. MacDFT hangs before the Window Manager completes drawing the window frame, or shortly after the frame draw and the content region goes black. This problem happens often on systems with 8•24 style video and Coax/Twinax cards. It is also more likely to happen on a Macintosh IIci, Macintosh IICx, or Macintosh IIfx than on a Macintosh II or Macintosh IIX.

But a similar problem has a different solution: Some NuBus conflicts happen with the Portrait or Workstation display cards and the Apple Coax/Twinax card. The error shows up when launching MacDFT. At launch, the Macintosh bombs and gives a bus error (if the system has MacsBug installed) or displays a system error of ID=28. Use A/ROSE v1.1.2 to fix this problem.

System 6.0.5 & 6.0.7: Helvetica Narrow Fonts (11/94)

=====

Article Created: March 11, 1991  
Article Reviewed/Updated: 14 November 1994

TOPIC -----

System 6.0.7 Installer has a FONT problem if I:

- 1) Install the FONTS from the LaserWriter IINT into the System.
- 2) Create a MacWrite document using Helvetica and N Helvetica Narrow.
- 3) Update the System software with Easy INSTALL. It doesn't matter if I'm updating from 6.0.5 to 6.0.5, 6.0.5 to 6.0.7 or 6.0.7 to 6.0.7.
- 4) Look at the FONTS in the MacWrite menu. I still have N Helvetica Narrow, but the text that should be N Helvetica Narrow is Geneva.
- 5) Look in the System file FONT list with ResEdit. The N Helvetica Narrow family still exists, but the individual FONTS normally listed under the family heading have disappeared.

This problem appears on a Macintosh IIsi, Macintosh SE or Macintosh Classic running System Software 6.0.5 or 6.0.7 (Swedish or U.S. versions).

DISCUSSION -----

Reinstalling the Narrow FONTS fixes this problem. After reinstalling, all the other FONTS should be all right, too.

HP 2P LaserPrinter: Connecting to a Macintosh

=====

Article Created: March 11, 1991  
Article Reviewed Only:  
Article Last Updated:

TOPIC -----

Is there any way to connect a Macintosh to an HP 2P LaserPrinter? I have unsuccessfully tried using the Orange Micro Grappler LX. The Grappler LX does work, however, with the HP LaserJet Plus.

DISCUSSION -----

We contacted Orange Micro and found that the HP 2P and Macintosh computers using a 68020, 68030, or 68040 can connect with a Grappler LX. Macintoshes using a 68000 must use the Orange Micro Grappler LS.

Orange Micro also states that the HP printer must have a minimum of 1MB of RAM to function properly with their equipment.

MacX: How To Specify Available Window Fonts

=====

Article Created: March 11, 1991

### Article Change History

-----

04/20/93 - REVIEWED

- For technical accuracy.

### TOPIC -----

I want to use the Fonts selection feature in MacX to customize the font selection in DECterm windows.

How do I use this menu item?

### DISCUSSION -----

The "F" item in the MacX "Edit" menu, or Command-F, brings up the Font Director dialog box. Font Director lets you see a sample of the typeface without having to run font clients or type commands with long and cryptic font names. Font Director also lets you sort fonts in various ways, assign aliases to font names, and compile fonts from Bitmap Distribution Format (BDF) files.

To use this command, tell the DECterm client which font to use in the window. Specify a font in the remote command to invoke the X client (DECterm in your case). This is similar to the "-fn" option when you invoke "xterm" in UNIX.

The command to invoke DECterm is CREATE/TERMINAL. To specify which font to be used in the window, use the /WINDOW\_ATTRIBUTES=(keyword [,...]) qualifier. The keyword is FONT for this case. Example:

```
create/terminal/window=(rows=24,columns=75,font=timR24)/  
application_keypad/insert/line_editing/detached
```

The above command creates a DECterm window using X font alias timR24. Note that you can abbreviate the VMS qualifier so the command string doesn't exceed the 255 character limit.

IBM Token Ring Bridge: Filter Programs

=====  
Article Created: March 11, 1991  
Article Reviewed Only:  
Article Last Updated:

TOPIC -----

I have a customer who needs to set up an IBM Source Routing Bridge to filter AppleTalk in order to allow us to run an Internet Router in parallel with it. IBM supplied them with some sample programs, but these sample programs only show how to filter ranges of Token Ring addresses. This would be fine if the only Token Ring cards running AppleTalk were Apple's cards, but this is not the case. Do you know of anyone that has written an AppleTalk protocol filter for this bridge that might share this code with my account? What types of filters are supported by the Token Ring Bridge program?

DISCUSSION -----

We are not aware of anyone having an IBM Token Ring Bridge filter program for AppleTalk. The Token Ring Bridge program supports three types of filters:

1. Link Limiting Filter: to be used for remote bridge, such as two half bridges connected by a T1 line.
2. NetBIOS Filter: to accept or discard only NetBIOS protocol.
3. Address Filter: to accept or discard a range of Token Ring address.

According to the IBM Token Bridge Program 2.1 User's Guide, you can have up to 10 filters in the FILTER.BAT file. Thus, you can add one or more address filters in this file to filter out the token ring addresses of the other non-Apple token ring cards. Otherwise, you have the option to write your own AppleTalk filter using DOS Macro Assembler language.

## A/UX: Missing /dev/cXd0s3 File (9/94)

Revised: 9/23/94  
Security: Everyone

A/UX: Missing /dev/cXd0s3 File (9/94)

Article Created: 11 March 1991  
Article Reviewed/Updated: 23 September 1994

TOPIC -----

After loading A/UX, I needed to mount the slice 3 partition onto "/users." For some reason, when A/UX loaded, the /dev/dsk/cXd0s3 and /dev/rdisk/cXd0s3 drivers did not load (where "X" is the SCSI ID of the disk being loaded). I had to shutdown and change the SCSI ID before creating and mounting a file system on slice 3 for "/users." Why is this?

This leads to another problem: when installing, the Installer automatically modifies "/etc/fstab" to include an entry for "/usr" on slice 2 of the drive. Since I had to change the SCSI ID of the drive, the fstab entry was now incorrect. When I started up the system after changing the SCSI address, I got the message, "The file system on /dev/dsk/cXd0s2 is damaged. Do I want to repair?" When you say yes, it says it can't make the repairs, since of course it can't find the SCSI ID in "/etc/fstab". I went into "/etc/fstab" and changed the entry to match the new drive ID, which of course solved the problem.

Why doesn't the installer automatically create a "fs" on slice 3 and permanently mount it? Why weren't the "/dev/dsk/cXd0s3" and "/dev/rdisk/cXd0s3" files loaded?

DISCUSSION -----

Did you follow a nonstandard or standard procedure when installing A/UX? For instance, if you follow a nonstandard procedure and create a separate "Usr" partition, the slice 2 is automatically assigned to that partition. From the error message above, it seems that the "Usr" on slice 2 was created by the installation process, but we're not positive what originally partitioned.

An output of "dp /dev/rdisk/cXd0s3l" would help identify what partitions have been partitioned and what associated slices have been assigned.

In general, if a particular device driver entry was missing from the /dev/[r]dsk

directory, you don't have to shutdown the system and change the SCSI ID. The entry is easily re-created by either entering the "mknod" or "pname" command. For example,

```
mknod /dev/dsk/c6d0s3 b 24 3
chmod 600 /dev/dsk/c6d0s3
chown bin /dev/dsk/c6d0s3
chgrp bin /dev/dsk/c6d0s3
```

Note that 24 is the major device number and 3 is the minor device number for /dev/dsk/c6d0s3. b is indicated as a block device type.

```
pname -c6 -s3 "/users"
```

The /dev/[r]dsk/c6d0s3 files will be automatically created in the /dev/[r]dsk directory. Note that "/users" is the partition name in dpme (disk partition map entries). Use "dp /dev/rds/c6d0s31" to see its exact spelling.

When using HD Setup for A/UX, the predefined A/UX partitioning schemes include three partition assignments. The partition named "A/UX Root" is assigned with slice 0, partition named "Swap" is assigned with slice 1 and a 4 MB Macintosh partition is defined. Remaining space is used for free UNIX slice 3. If the "custom" button is selected, other partitions and associated slice numbers can also be selected. For example, A/UX Usrc partition will have slice 2, Free UNIX partition will have slice 3 through 6, and so on.

The reason that the installation process doesn't make a file system and permanently mount on these partitions is because the pre-assigned partition/slice may not be big enough to make a real file system (either SVFS or UFS).

## A/UX: How To Figure Swap Partition Sizes

Revised: 9/29/92  
Security: Everyone

A/UX: How To Figure Swap Partition Sizes

Article Created: March 11, 1991

### Article Change History

-----  
08/31/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

Can you recommend a good size swap partition for best performance under A/UX? I'm using a 200MB drive and have a Macintosh IIx with 20MB, though I'm also interested in recommendations for a 32MB Macintosh IIx system.

Also, is there any formula (physical RAM +10MB, for instance) for determining a good swap size? I assume the swap size should be larger than the physical RAM in the system.

### DISCUSSION -----

The size of swap space should be larger than the physical memory size. Actually, there is no magic "formula".

A standard version of A/UX 2.0, based on an A/UX with 8MB of physical memory, has about 18MB of disk space allocated for swap purposes. 18MB is twice as much as the physical memory. Therefore, if disk space is not a restraint, we recommend two to two and a half times the physical memory size be assigned for swap space. If disk space is a concern, less than twice of physical memory size may be allocated for swap space.

Note that the swapping in and out activity occurs only when the available physical memory is used up. If your applications require large amounts of memory allocation, you should increase the swap size. Use the "swap -l" to view the current free swap size. If you have a reserved A/UX partition, you may use the "swap -a ..." to add additional swap area.

## LaserWriter IINTX: System Printer with VAX Host

Revised: 6/19/91  
Security: Everyone

LaserWriter IINTX: System Printer with VAX Host

=====

Article Created: March 11, 1991  
Article Reviewed Only:  
Article Last Updated:

TOPIC -----

How do I use a LaserWriter IINTX printer as system printer for a VAX host?

I'm looking for general pointers, including PATHWORKS, and some comparison shopping tips, such as equipment, labor and training requirements to install and support this kind of printer.

DISCUSSION -----

PATHWORKS for Macintosh has a VAXshare Print service that does what you want.

VAXshare print servers work very much like AppleShare print servers. When you send a document to a VAXshare print server, VAXshare receives the file's contents. The server then prints instructions from your Macintosh application and saves a print file on the disk. VAXshare returns the printer codes to your application to signal that printing is done.

VAXshare print servers access both Apple and Digital PostScript network printers. Since the LaserWriter IINTX has to be on a LocalTalk network, you'll need a router between EtherTalk and LocalTalk. Examples of routers include the Apple Internet Router, Shiva FastPath, Farallon Liaison, Cayman GatorBox, or devices that connect the LaserWriter II printer to Ethernet, such as EtherPrint.

After installing PATHWORKS on a VAX, the system manager goes into the MSA\$MANAGER program, adds a printer queue, and starts it. These printer queues are standard VMS queues, so they work the same way as other existing VMS queues (using SET QUEUES, START, and STOP QUEUES commands). VMS users also can print to these queues with the PRINT/QUEUE= command.

On the Macintosh side, selecting a VAXshare print spooler is similar to selecting an AppleShare Print Spooler. From the Chooser, select the zone (if necessary) then select the LaserWriter icon from the group of icons on the left side of the Chooser window.

There shouldn't be much training needed for doing this. On the VAX side, VMS System Managers are familiar with VMS queues, and installation on the VAX is done with standard VMSINSTAL. Macintosh users need only choose the standard printer/spooler name.

The only issue is the amount of printing you'll be doing. If there will be much printing that doesn't require laser quality, then a standard line printer might be all you need.

Security: Everyone

A/UX: How To Get Classic Terminal Logon Screen at Launch (8/94)

=====

Article Created: 12 March 1991  
Article Reviewed/Updated: 24 August 1994

TOPIC -----

Is it possible to launch A/UX so that a classic terminal logon screen comes up without having to use the Macintosh logon screen?

DISCUSSION -----

Yes, and here's how:

- Modify the /etc/inittab file to have the "co" entry execute a different shell script (for instance /etc/unixlogin below) instead of /etc/loginrc (executes the Macintosh Login)

or

- Make the /mac/bin/Login program nonexecutable or nonexistent by renaming it. The /etc/loginrc shell script checks to see if /mac/bin/Login is executable. If not, it will execute "/etc/getty" instead of /mac/bin/Login.

```
#!/bin/sh
# /etc/unixlogin
/bin/screenrestore
exec /etc/getty console co_9600
```

## Airport Security Scanners (X-Rays) Don't Damage Disks

Revised: 3/22/96  
Security: Everyone

Airport Security Scanners (X-Rays) Don't Damage Disks

=====

Article Created: 13 March 1991  
Article Reviewed/Updated: 21 March 1996

TOPIC -----

I'm concerned about my Macintosh Portable (or PowerBook) going through security scanners (x-ray machines) at airports. Is there a potential for short-term or long-term damage?

DISCUSSION -----

The American Society for Testing and Materials (ASTM) conducted a study on X-ray induced damage to memory devices, including audio and video tapes and floppy disks, and found that the devices have enough shielding to protect the media.

The study found that the magnetic field was actually strongest around the monitor. They taped a disk to the monitor for several hours without damage. A committee member suggested that it would take at least 1000 million passes through the machine before any damage would be evident.

## AppleShare: Modification Date Depends On Client's Clock (4/94)

Revised: 4/11/94  
Security: Everyone

AppleShare: Modification Date Depends On Client's Clock (4/94)

=====

Article Created: 13 March 1991  
Article Reviewed/Updated: 7 April 1994

TOPIC -----

We have an AppleShare File Server. One morning, a user put a file at the root level. On his machine, the file correctly showed a modification date of 21 February.

When the server volume was mounted on another Macintosh, the modification date showed up as 18 February. We noticed that this Macintosh's clock was set to 18 February. When we reset the clock to the correct date, the modification date changed back to 21 February.

What's going on here? The date on any single machine should not affect the date that shows up for the file. Shouldn't the server be giving the creation date? Why would the Finder show the wrong date?

DISCUSSION -----

This is not a bug and is intentional. Here is some text from "Inside AppleTalk, Second Edition," pages 13-21 and 13-22, that discusses this subject:

Date-time Values

-----

"All date-time quantities used by AFP specify values of the server's clock. These values correspond to the number of seconds measured from 12:00 AM on January 1, 2000. In other words, the start of the next century corresponds to the date-time of 0. AFP represents date-time values with 4-byte signed integers."

"One of the AFP calls, allows the workstation to obtain the current value of the server's clock. At log on time, the workstation should read this value (s) and the value of the workstation's clock (w) and compute the offset between these values: s-w. All subsequent date-time values read from the server should be adjusted by subtracting this offset from the date-time. All subsequent date-

time values sent to the server should be adjusted by adding this offset to the date-time. This adjustment will correct for differences between the two clocks and will ensure that all workstations see a consistent time base."

One thing to note here is with Apple's AFP servers, the time base is not adjusted if the workstation's clock and server's clock are within 15 minutes or so of each other. This is done so slight differences between the workstation's clock and the server's clock settings do not affect the file date-time values. If the time difference is more than 15 minutes, the time is adjusted to the nearest half hour. For example, if the server clock is 20 minutes ahead of the workstation clock, the date-time value for a file would be 30 minutes less on the workstation. Non-Apple AFP servers may do this differently.

#### Some Examples

-----

Note: These examples assume the time zone values are set correctly on the server and the client unless otherwise specified.

- Example 1:

There is an AppleShare File Server in New York and its clock says it is 4:01 PM. There is an AppleShare client in Los Angeles that is logged into the server in New York and its clock says it is 1:00 PM. A "Get Info" is done on file "X" by someone in New York on the New York server and the created and modified date-time says:

"Wed, Mar 4,1992, 7:07 PM"

At the workstation in Los Angeles, a "Get Info" is done on file "X" on the New York server, and the created and modified date-time says:

"Wed, Mar 4,1992, 4:07 PM".

As you can see, the client in Los Angeles shows the file created and modified date-time stamp as being 3 hours earlier.

- Example 2:

There is a AppleShare File Server in San Jose and its clock says it is 8:21 PM. There is a AppleShare client, also in San Jose, that is logged into this server and its clock says it is 8:00 PM. A "Get Info" is done on file "X" at the server and the created and modified date-time says:

"Wed, Mar 4,1992, 7:07 PM".

The client does a "Get Info" on file "X" and the created and modified date-time says:

"Wed, Mar 4,1992, 6:37 PM".

If the client's clock had been within 15 minutes of the server's clock, the file would have had the same date-time stamp.

All of our testing regarding this date-time stamping issue shows that the actual time shown in the "General Controls" or "Date & Time" Control Panel is what is

used to compute the date-time offset between the client and the server.

## LaserWriter Performance: Color/Gray Scale vs Black & White

Revised: 6/19/91  
Security: Everyone

LaserWriter Performance: Color/Gray Scale vs Black & White

=====

Article Created: March 13, 1991  
Article Reviewed Only:  
Article Last Updated:

TOPIC -----

Does changing a LaserWriter's default dialogue box from color/gray scale to black and white improve printing performance? Can I use ResEdit to do this, or is there another way to change the default?

DISCUSSION -----

On AppleLink, in the Tech Info Library, you will find a patched version of the LaserWriter 6.0.1 driver that defaults to black and white. Use the search criterion of "LaserWriter 6.z.1".

The LaserWriter 6.0.x drivers, when in "Black & White" mode, print black and white documents as fast or slightly faster than the LaserWriter 5.2 drivers. This is true for both text or graphic documents.

The LaserWriter 6.0.x drivers, when in "Color/Grayscale" mode, are as much as 8 times slower than the LaserWriter 5.2 drivers. Black and white text-only documents will print as if the "Black & White" mode was selected. The "Color/Grayscale" mode should be used only in situations where you are printing documents that are multicolor or gray scale images.

The LaserWriter 6.0.x drivers default to "Color/Grayscale" mode, so you'll have to change the setting every time you print if they want to use "Black & White" mode.

## Macintosh: When Application Colors Change Unexpectedly

Revised: 6/19/91  
Security: Everyone

Macintosh: When Application Colors Change Unexpectedly

=====

Article Created: 19 March 1991  
Article Reviewed Only:  
Article Last Updated:

TOPIC -----

I have a Macintosh IIsi with 5MB of memory, a 13-inch High Resolution color monitor with built-in video, 40MB hard disk, and NuBus adapter.

My problem appears randomly, always when running these applications: Telnet 2.3, Microsoft Word 4.0b, and Microsoft Excel 2.2a.

In Excel, when I call up a dialog box (to set borders, for example) the colors of the box will be messed up. If I keep reopening the dialog box the colors will eventually change. For example, the box may initially come up with a black background and black letters, then a blue background with black letters, then a red background, with black letters, and so on.

DISCUSSION -----

It sounds like something is changing the System color table. We have experienced this when using the Kolor CDEV (the CDEV that allows you to change the color of the windows, buttons, scroll bars, and so on). If you're running MultiFinder, one of your applications may be setting the System color table to its own custom palette. 4th Dimension, for example, can change the System's color table.

Your workaround depends on whether it's an application or a CDEV that's changing the color. If it's something like Kolor, turning it off may be the only solution. Or perhaps there's been an update to the CDEV--check with the publisher for the latest version. With 4th Dimension, some people have used ResEdit to eliminate the offending resource. But this causes some applications to crash, so we don't recommend this solution.

Also, reinstalling the System may be a solution. It could be that your

System color table has simply been corrupted.

## Novell: How It Handles Desktop Information (11/94)

Revised: 11/9/94  
Security: Everyone

Novell: How It Handles Desktop Information (11/94)

Article Created: 16 March 1991  
Article Reviewed/Updated: 09 November 1994

### TOPIC -----

Does Novell duplicate the function of the Apple Desktop file or the Desktop Manager implementation on AppleShare?

What does the Resource Manager do when the desktop size exceeds the Resource Manager addressability limit?

### DISCUSSION -----

The AppleTalk Filing Protocol requires that each server maintain a desktop database containing information associating documents with applications and files with icons. This information helps the Finder know which icons to display for files, and which applications to launch when documents are opened. The Finder uses this database to build the familiar Macintosh graphical user interface.

In addition to a name, every Macintosh file has a four-character type code that identifies the nature of the file, and a four-character Creator code that identifies the application that created the file. For example, a document created by MacWrite has a Type value of WORD and a Creator value of MACA. The desktop database uses these values to find the appropriate icon for files of type WORD. Likewise, the desktop finds the appropriate application used for opening or printing files of this type using the value MACA.

When the Finder on a Macintosh workstation displays the contents of a server folder in a window, it attempts to find the appropriate icon for each file. First, the Finder looks in memory to see if it found the correct icon in a recent search. Then, it looks on the local Macintosh hard disk. If the icon is not found, the Finder requests the icon from the server. If the server volume's desktop database contains the appropriate icon, the server sends the icon to the Macintosh. If the icon is not found locally or in the server volume's desktop database, the Finder displays a generic icon for the file.

Once the Finder has determined that an icon cannot be found for a particular file type, it will not ask the server again until the Finder is restarted. This optimization prevents the Finder from repeatedly making the same request, which would slow the server.

In NetWare for Macintosh 4.0, the desktop database is stored in two files in the DESKTOP.AFP folder at the root of each volume. AFP.NLM creates the folder and database files on each volume that supports the Macintosh name space. These files, ICON.BTV and APPL.BTV, are in a proprietary, highly-optimized format, and are not meant to be used by programs other than AFP.NLM.

#### Maintaining and Rebuilding the Desktop Database

-----

The Macintosh Finder and AFP.NLM share the responsibility of maintaining the desktop database. The Macintosh Finder incrementally updates the desktop database when it copies new files to the server volume. In version 7 and later, the Finder always ensures that when a document is copied to the server volume, the appropriate icons are also copied, if necessary. The Finder also updates the desktop database whenever it copies an application to the server volume, so that the application can be launched when documents are opened or printed.

NetWare for Macintosh is ultimately responsible for the contents and integrity of the desktop database for each of the volumes it supports. While it is possible to rebuild a server's desktop database using the System 6 Finder (but not MultiFinder), doing so will not enable you to locate the new color icons used in System 7. NetWare for Macintosh can examine all the files on each volume, and can rebuild the desktop database on each of its supported volumes. Because this process is carried out on the server, it is much faster and more efficient than rebuilding the desktop from a Macintosh workstation.

## DAL 1.2: Problem Accessing VM Host (11/94)

Revised: 11/7/94  
Security: Everyone

DAL 1.2: Problem Accessing VM Host (11/94)

Article Created: March 16, 1991  
Article Reviewed/Updated: 07 November 1994

TOPIC -----

- 1) I'm trying to get DAL 1.2 for VM to work with an IBM 3090. I'm using a Macintosh II connected by a coax, a DCA MacIrma card, and am running "DAL debugger for MacIrma".

After trying several times, I keep getting the error #10646 (-43). What does this error mean?

- 2) What state should the server be in when attempting access?
- 3) What programming languages support DAL development?

DISCUSSION -----

- 1) Error -10646 means the DAL client cannot load the Network Adapter. You probably have the wrong driver installed. MacIrma is shipping with the HLLAPI drivers, which DAL doesn't support. You need to call DCA and get the Apple API drivers. Apple does not have the rights to distribute them, so you have to get them from DCA.

To verify this, the following files should be in the system folder:

DFT: "MacIrma SNA 2.1.0" (or .1) and "MacIrma DAL Driver" 1.2.0  
CUT: "MacIrma DAL Driver" 1.2.0

In addition, be sure that your coax line is correctly identified as CUT or DFT in your DAL connection script.

- 2) Once a session is established between the DAL client and the DAL server, the server will be ready to accept any request from the client. Perhaps an explanation of DAL Request/Reply relationship would help:

DAL uses a request/reply relationship between the desktop and the server(s). The user connects to the host machine using the query tool (HyperCard, 4th Dimension, or a custom C or Pascal program). The query tool application passes the request to the DAL API, which in turn establishes a connection to the host server. The DAL server on the host receives the request and translates it to the SQL dialect of the opened database. The server then checks the syntax and passes the translated request to the proper database. The database complies and passes the data back to the DAL Host Server. The Host Server checks for errors, mapping them to the standard error set that DAL supports. The server then assembles the results returned from the database sends them to the Macintosh. The query application sees the results are available and begins to put them, item by item into its own window (such as a spreadsheet window).

- 3) DAL provides Application Programming Interfaces for C, Pascal, and HyperCard.

PATHWORKS: Printing on AppleTalk Phase 1 Networks

=====

Article Created: 19 March 1991  
Article Reviewed Only:  
Article Last Updated:

TOPIC -----

We are implementing the Tolas accounting system using PATHWORKS for Macintosh. We will be linking a MicroVAX to Macintosh systems on Ethernet and using LocalTalk to connect to our LaserWriters. Since we are using AppleTalk Phase 1, we can't send files to the LaserWriters.

Can we do what we want without using PATHWORKS for Macintosh? Can we just run AppleTalk for VMS 3.0 and still support AppleTalk Phase 1?

DISCUSSION -----

PATHWORKS for Macintosh is the name for an integrated set of components in one client/server product. The package includes file sharing, data access, electronic mail, and resource services for Macintosh clients. AppleTalk for VMS 3.0 is included in the product but it supports only AppleTalk Phase 2.

If you are using the Apple Internet Router, install the Upgrade Utility. If you are using non-Apple routers, use an equivalent Phase 1/Phase 2 transition utility. Because this is only a temporary solution, eventually you will want to upgrade all your routers to AppleTalk Phase 2.

Consult the AppleTalk Phase 2 Introduction and Upgrade Guide for upgrade procedures.

## VAX RDBMS: Access from Macintosh and MS-DOS

Revised: 7/23/93  
Security: Everyone

VAX RDBMS: Access from Macintosh and MS-DOS

=====

Article Created: March 17, 1991

TOPIC -----

Is there an RDBMS for VAX/VMS that fully uses the Macintosh as a VAX server client? Most RDBMS packages only use the Macintosh in VT100 emulation mode. I want a package that gives the Macintosh and PC the same screen look.

DISCUSSION -----

Check the following Client/Server VAX database access products:

- Apple's Data Access Language (DAL):

An Apple DAL Server can run on VAX/VMS providing Data Access Language access to databases. The server works cooperatively with Macintosh applications that support Data Access Language.

The server receives a request from a Macintosh application, carries it out on the VAX, and sends the desired data back to the Macintosh application. The Macintosh application can be HyperCard, 4th Dimension, popular spreadsheet products such as Excel and WingZ, or C programs. DAL operates under existing host and database-management security and integrity schemes, assuring complete data security with no additional maintenance requirements.

The server supports serial lines (directly or via modem) or AppleTalk Data Stream Protocol (requires Apple's AppleTalk for VMS running on VAX system). Databases supported by DAL Server for VAX/VMS include: Informix, Ingres, Oracle, VAX Rdb/VMS, and Sybase.

Apple DAL Server is available from APDA.

- SequeLink, Version 2.1:

This program allows cooperative processing between Macintosh and VAX computers. With it, you can write a Macintosh front-end to a relational database residing on a VAX, using environments such as HyperCard, Microsoft Excel or 4th Dimension, and compiled languages such as C, Pascal, or MacApp. Your Macintosh application can then access transparently the relational database on the VAX, off-loading the VAX.

SequeLink can write on-line transaction processing application and decision support applications. SequeLink supports Oracle, Ingres, VAX Rdb/VMS, and Sybase. It runs over AppleTalk and DECnet. The SequeLink product family includes other client and server platforms, such as MS-DOS, OS/2, UNIX, AS/400, and MVS.

SequeLink, Version 2.1 is available from TechGnosis, Inc.

To locate a vendor's address and phone numbers, use vendor name as a search string.

## PATHWORKS: VAXshare Support for LaserWriter 6.0.X

Revised: 6/19/91  
Security: Everyone

PATHWORKS: VAXshare Support for LaserWriter 6.0.X

=====

Article Created: March 17, 1991  
Article Reviewed Only:  
Article Last Updated:

TOPIC -----

How do I get VAXshare Print Service in PATHWORKS for Macintosh to work with LaserWriter 6.0.X? The help facility in PATHWORKS doesn't help.

DISCUSSION -----

There are two modules in the device control library that are not only unnecessary, their presence prevents the ADD PRINTER command from working correctly. Delete them with this command:

```
$ library/delete=(msap$permdict1,msap$permdictquery1) -  
_ $ sys$library:msap$devctl.tlb
```

Then, add the printer, using the /SETUP qualifier to specify the appropriate level of Laser Prep (msap\$appledict70 = Laser Prep 6.0):

```
MSA$MANAGER> add printer "Spooler Name" -  
_MSA$MANAGER> /queue=sys$print -  
_MSA$MANAGER> /destination="Printer Name@Zone Name" -  
_MSA$MANAGER> /setup=msap$appledict70  
MSA$MANAGER> start printer "Spooler Name"
```

Other modules available in the device control library are:

|                   |                  |
|-------------------|------------------|
| MSAP\$APPLEDICT66 | (Laser Prep 5.0) |
| MSAP\$APPLEDICT67 | (Laser Prep 5.1) |
| MSAP\$APPLEDICT68 | (Laser Prep 5.2) |

If /SETUP is not used, the default is 5.2.

## Macintosh IIsi, LC Series: Not Designed for Vertical Operation

Revised: 7/12/93  
Security: Everyone

Macintosh IIsi, LC Series: Not Designed for Vertical Operation

Article Created: 19 March 1991

### Article Change History

-----  
07/12/93 - REVISED  
          \* To include Performa 400 series.  
02/01/93 - REVISED  
          \* To include the LC III.

### TOPIC -----

I want to use my Macintosh IIsi and Macintosh LC in a vertical position.  
If I leave enough room for ventilation, will this cause any problems?

### DISCUSSION -----

The Macintosh IIsi, the Macintosh LC Family (LC, LC II, LC III), and Performa 400 series (Performa 400, 405, 430, 450) weren't designed to operate on their sides. Because Apple hasn't tested these computers in a vertical position, Apple can't recommend that customers use them this way.

We do know that the floppy-disk drives and hard drives will work properly either horizontally or vertically. Ventilation shouldn't be a problem as long as there's 4 to 6 inches of clearance around all the computer's vents.

## AppleShare PC: Using with Extended Memory (11/94)

Revised: 11/7/94  
Security: Everyone

AppleShare PC: Using with Extended Memory (11/94)

=====

Article Created: 19 March 1991  
Article Reviewed/Updated: 07 November 1994

TOPIC -----

I want to load parts of PhoneNet Talk software into extended memory. I also want to load AppleShare Print Server and File Server into the top 3MB of expanded memory on a 4MB 386 machine. I'll be running PFS FirstChoice and the QEMM-386 utility.

Can I do this? How?

DISCUSSION -----

Yes, most of AppleShare PC can be loaded into a PC's "high memory" (conventional memory is the range from 0 to 640K, high memory is the range between 640K and 1024K). High memory is generally used by the PC BIOS, expansion cards, video memory, and other system resources. Very few PCs use their entire address range for such purposes. Most machines have space available that can be mapped to extended memory and used to load user software, such as drivers and TSR (Terminate and Stay Resident) utilities.

Unfortunately, DOS doesn't have a standard way to manage high memory ranges for user programs. It also can't find available ranges within high memory. Using this space means that programs sharing the same memory space may begin to write over each other resulting in unpredictable crashes, freezes, and generally weird behavior.

The QEMM-386 utility addresses this problem by providing extended, expanded, and high memory management functions. Extended and expanded memory is beyond the scope of this discussion and is somewhat irrelevant to your problem. What you should be concerned about is high memory.

QEMM-386 maps out available high memory ranges. Once this is done, QEMM-386 can then begin to "LOADHI" specific software, usually drivers and TSR utilities.

This whole process is a bit involved but is documented well in the QEMM-386 manuals. We strongly recommend that you read it. Below is a rough outline of the procedure. This general procedure must adapt to fit the needs of the specific hardware and software you're using.

- 1) Install AppleShare PC, and confirm it functions satisfactorily, allowing it to load from the AUTOEXEC.BAT file.
- 2) Perform a basic install of QEMM-386. Modify its line in the CONFIG.SYS file, enabling its "ON" option. Reboot. QEMM-386 and AppleShare PC should both load.
- 3) Exercise the installed hardware, meaning format floppy disks, print something, send something through each COM port, and so forth. The idea is to access memory ranges that may be associated with the PC hardware.
- 4) Without rebooting, use the QEMM analysis feature to determine which high memory ranges are available and which are already in use by the PC.
- 5) Modify the CONFIG.SYS line for QEMM-386 to INCLUDE and EXCLUDE the appropriate memory ranges discovered in the previous step. Also, remove the ON option you added in step 2. Reboot.
- 6) Use the QEMM-386 Optimize program to find which parts of the system and AppleShare PC it can load into the new high memory. This is a fairly automated process, but it requires three reboots. When complete, the Optimize program should indicate how much conventional memory was saved by loading software into high memory instead of conventional memory.
- 7) Confirm that the MINSES.EXE program is not one of those that is loaded into high memory. If it is, change it by removing the reference to LOADHI that loaded it. MINSES is a required part of the AppleShare PC software, but will cause problems if loaded into high memory. (MINSES and REDIR were both written by Microsoft, and assist in directing standard DOS commands to network devices.)

This is a very short description of the process, but it should give you a general idea of what to do. Again, we recommend reading the QEMM-386 manual for exact details. In addition to installation, the manual covers the different capabilities and uses for each PC memory type.

## PATHWORKS VAXshare: Multilaunching Applications (11/94)

Revised: 11/7/94  
Security: Everyone

PATHWORKS VAXshare: Multilaunching Applications (11/94)

=====

Article Created: 19 March 1991  
Article Reviewed/Updated: 07 November 1994

TOPIC -----

I'm testing PATHWORKS for Macintosh and have a problem multilaunching Claris applications, such as MacDraw, on the VAX. I'm able to multilaunch Microsoft applications on the VAX.

Is this only a problem with Claris? Is there a way to fix this?

Ideally, I'd like to be able to share all the applications on the VAX between the Macintosh users.

DISCUSSION -----

This situation isn't just limited to a PATHWORKS VAXshare server. We tried the same thing on an AppleShare File Server and got the same result.

Microsoft Technical Support says that Microsoft Word, Microsoft Excel, Microsoft File, and PowerPoint are all multilaunch applications. Each has some limited multi-user capabilities as well.

This is not a limitation of Claris' software: these applications are not supported as multilaunch applications. The effects of multilaunching are unknown. Also, keep in mind possible licensing problems, because these applications are sold as single-user applications.

Check with the vendor of the application to determine if it provides multi-launch capability.

## Personal LaserWriter NT: Cause of Partial Two-Sided Pages

Revised: 6/19/91  
Security: Everyone

Personal LaserWriter NT: Cause of Partial Two-Sided Pages

=====

Article Created: 25 March 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

When I try to print double-sided pages on a Personal LaserWriter NT using manual feed, very often the back side of the page doesn't print. Any ideas?

DISCUSSION -----

This printing problem occurs if there is a delay feeding paper to the multi-purpose tray. The lower portion of the image will begin to disappear about 10 seconds after the Paper Out indicator lights, or about 4 seconds after the preceding page ejects. The amount of the image affected depends on the length of the delay. If too much time passes and the image disappears, the Personal LaserWriter NT will ignore that page entirely and continue with the rest of the print job.

Because double-sided printing requires feeding paper one sheet at a time, and because you must wait for the first sheet to complete before feeding the next, you have little time before the image begins to disappear.

The only workaround is to insert your pages more quickly. Before we figured out what was really happening, we noticed that the problem diminished the more we tried to reproduce it. We were getting better at feeding the paper, and so didn't cause a sufficient delay to see the problem.

## SMB File Transfer: Access over Ethernet (11/94)

Revised: 11/7/94  
Security: Everyone

SMB File Transfer: Access over Ethernet (11/94)

Article Created: 20 March 1991  
Article Reviewed/Updated: 07 November 1994

TOPIC -----

We can access SMB over Token Ring, but not over Ethernet. Will it ever be possible to access SMB servers over Ethernet?

DISCUSSION -----

While the SMB protocols are not limited to Token Ring, they are usually used only with Token Ring. Since Apple's SMB File Transfer utility works so closely with the Texas Instruments Token Ring interface controller chip set on the TokenTalk NB card, it's difficult to port to an Ethernet environment without a major rewrite of the software.

A workaround is to use MacLAN Connect, a product that allows any PC or compatible to act as an AppleShare compatible server. All hard disks, LAN volumes or other storage devices are available to AppleShare-connected Macintosh workstations. MacLAN Connect supports LocalTalk, EtherTalk and TokenTalk.

Ungermann-Bass: Description of AppleTalk & Macintosh Products

=====

Article Created: 20 March 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I need some information on Ungermann-Bass. I think they have a Macintosh product, but I am unable to find it listed on AppleLink.

Do you have any information on this company and their Macintosh products?

DISCUSSION -----

The following are from the Apple Multivendor Network Solutions Guide, August 1990:

### Access/One MaxTalk Interface Module

The Access/One MaxTalk Interface Module delivers high-performance networking among Apple Macintosh personal computers and other LocalTalk devices such as printers, and integrates those devices into an Ethernet, FDDI, token ring, or broadband network. The MaxTalk Module supports 16 individual LocalTalk devices or 16 daisy-chained LocalTalk networks using unshielded twisted-pair wiring. LocalTalk connectors may be connected directly into twisted-pair cabling star-wired from Access/One Enclosures. Up to four MaxTalk Interf modules may be installed in a single ASE-3000 System Enclosure, and up to ten MaxTalk Interface Modules may be installed in a single ASE-7000 System Enclosure. The MaxTalk Modules may be installed in a single ASE-7000 System Enclosure. The MaxTalk Module filters traffic on each of its 16 ports, forwarding data packets only to their addressed destinations. Each device has its own dedicated 230.4 Kbps transmission line. All 16 devices attached to the MaxTalk module can simultaneously use the network.

Net/One MacUWS

MacUWS provides a Macintosh front-end to host applications, turning routine activities into an interactive process with pull-down menus, scroll bars, and selection buttons for point-and-click mouse support. End users can share resources and information throughout the network with MacUWS. Included is a VT100 terminal emulator that supports up to five Telnet sessions. Each session runs in a user-configurable window. Using a standard File Transfer Protocol (FTP) facility, network users can download data from host computers for local use. MacUWS includes a standards-based TCP/IP driver, FTP/Telnet capabilities, and the Advanced Scripting and Application Platform (ASAP) language. MacUWS provides support for Apple's EtherTalk (IEEE 802.3) and LocalTalk, and users can run MacUWS under Finder and MultiFinder.

AppleShare File Server: Multilaunch Management Utilities

=====

Article Created: 21 March 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Are there any AppleShare utilities that limit the number of copies made of applications on the server?

DISCUSSION -----

Here are two programs that restrict launch restrictions on AppleShare:

KeyServer

Developed and used at Dartmouth and available from Sassafras Software, is a launch control package which also provides rwall and motd capability.

LaunchBreak

Developed by the University of Michigan's Computer Aided Engineering Network, LaunchBreak 1.0.3 is available to not-for-profit educational institutions.

LaunchBreak's features:

- Monitors the usage and enforces an upper limit for copying applications on an AppleTalk network.
- Applications running under LaunchBreak can be rendered useless outside of a site's network, hindering software piracy.
- Applications can be located anywhere on the network.
- Doesn't interfere with legitimate copying of programs for backup.

Applications can be freely copied, although the copied programs are still subject to control of LaunchBreak.

- The license server can run as a foreground application on an AppleShare server, or on another machine on the network.
- Remote administration of the license server
- Statistical record keeping on all server transactions.

System Requirements:

- System 6.0 or later
- AppleTalk Data Stream Protocol (ADSP).

For more information, search on "Sassafras" or "LaunchBreak"

## MacX: Window Position Problem (4/93)

Revised: 4/22/93  
Security: Everyone

MacX: Window Position Problem (4/93)

=====

Article Created: 23 March 1991

### Article Change History

-----

04/20/93 - UPDATED

- To include MacX 1.2 information.

### TOPIC -----

I'm using FrameMaker on a Sun, displaying in MacX 1.0. Some rootless windows are displaying their title bars underneath the MacX menu bar. MacX sets the top left corner of the X display server to be at (0,0), rather than compensating for the fact that the Macintosh menu bar is 20 pixels or so tall. I can't move these windows because I can't access their title bars.

I can adjust the window prefs file on the host, but the problem happens because of MacX's rootless operation, regardless of the host process.

### DISCUSSION -----

If your title bars are hidden under the Macintosh menu bar, drag the window out of the Macintosh menu bar while holding down the OPTION key.

Yes, it is true that the MacX 1.0 to 1.1.7 Window Manager sets the upper-left corner of the screen at origin (0,0). The Macintosh menu bar (MacX application in this case) is accounted in the entire screen coordinates. Therefore, when specifying the y coordinate for a rootless window, the height of the title bar must be taken into consideration. Otherwise, the application's title bar will be hidden under the Macintosh menu bar.

The MacX Window Manager automatically positions a window:

- if its display coordinates are off screen
  - or • if the command to create it doesn't have a geometry option
  - or • if the geometry option's x,y coordinates are 0,0
- MacX 1.2 will position the window just below the menu bar.

## A/UX: How to Collect System Crash Information (8/94)

Revised: 8/25/94  
Security: Everyone

A/UX: How to Collect System Crash Information (8/94)

=====

Article Created: 23 March 1991  
Article Reviewed/Updated: 24 August 1994

TOPIC -----

How can I get an operating system dump when A/UX either hangs or crashes?  
Is there any documentation on interpreting such output?

DISCUSSION -----

Currently A/UX provides no BSD UNIX styled "crash" system dump. However, A/UX does provide a basic kernel debugger (a module linked into the kernel).

To make a kernel that contains the "debugger" module, invoke the "newconfig debugger" command to build a new kernel. To boot a kernel that contains the "debugger" module, make sure that the "launch" from the A/UX Startup contains the -s option. The -s option causes "launch" to load the kernel symbol table into memory and allows the debugger to display addresses as symbolic names.

To use the debugger, connect an ASCII asynchronous terminal to the modem port (tty0). The debugger reads from and writes to the modem port at 9600 speed with 8-bit characters.

Two ways you can activate the debugger:

- by pressing the programmer's interrupt switch to produce a non-maskable level 7 interrupt.
- by calling the debugger's "sysdebug()" routine.

The above information was documented in greater detail in the Release notes for "A/UX Device Drivers Kit Version 2.0". This kit is no longer available.

## PATHWORKS-DECnet: Wide-Area Network Issues (11/94)

Revised: 11/7/94  
Security: Everyone

PATHWORKS-DECnet: Wide-Area Network Issues (11/94)

=====

Article Created: 24 March 1991  
Article Reviewed/Updated: 07 November 1994

TOPIC -----

I have a VAX in two countries: Hong Kong and Korea. Both sites have AppleTalk networks connected using PATHWORKS. I would like to connect these networks using X.25 (using VAX PSI software).

According to Digital and PATHWORKS documentation, I can run full DECnet over VAX PSI and have completely integrated operation. If I run PATHWORKS (AppleTalk-to-DECnet gateway), will I still have this level of transparency?

The literature I have read states that I can do this. But will I have to keep the X.25 link on all the time? How expensive is this? Or is the PSI software intelligent enough to connect to the X.25 network only when actually needed?

DISCUSSION -----

In theory, your setup should work. As long as you have a line and a circuit between the two DECnet nodes, creating the DECnet tunnel is just a matter of defining the "tunnel" port, giving it a name, taking care of routing costs, turning on the system, and (most important) specifying a partner (the DECnet node name of the other VAX).

In practice, you may encounter these problems:

- With AppleTalk 3.0 for VMS, we don't recommend any tunneling below 56KB. In many X.25 networks, the connection between the computer and X.25 pad may be slower than the connection between the pads.
- The X.25 link should be up all the time. There is no way for DECnet PSI software to be dynamically connected and "know" when AppleTalk packets should go through. Even if the software could do this, the tunnel port definitions on both ends can't be dynamic.

- If your X.25 network has any two-minute delays, AppleShare will have problems. The ASP session timer expires at two minutes, terminating the session and losing the server connection.
- Another problem has to do with NBP lookup. You might not see the file server when opening the Chooser and selecting the AppleShare icon. Some sites have to change a resource called GNRL to increase the Chooser interval timer and retry timer values.

You can find a complete discussion of this subject in the Tech Info library in AppleLink. For more information, search on "AppleTalk and Wide and Area".

## MacX25: Problems Using with Macintosh IIsi

Revised: 4/20/93  
Security: Everyone

MacX25: Problems Using with Macintosh IIsi

=====

Article Created: 23 March 1991

### Article Change History

-----

04/20/93 - REVIEWED  
• For technical accuracy.

### TOPIC -----

I installed MacX25 on a Macintosh IIsi and then tried to start the MacX25 Admin program. The MacX25 Admin program doesn't recognize my AppleSerial NB Card: I keep getting a "Status" "Out of service" message.

Is this a known problem?

### DISCUSSION -----

You are mostly likely using the first version of MacX25; the MacX25 server and MacX25 Admin software version 1.0 doesn't work on any computer that requires System Software 6.0.7 (such as the Macintosh IIsi). The problem involves the "Gestalt" function and is fixed in version 1.0.1 of MacX25.

Version 1.0.1 of MacX25 is compatible with both System 6.0.7 and System 7. To use the MacX25 server software under System 6.0.7, you'll need at least 2MB of RAM. Under System 7, you'll need at least 4MB of RAM.

TrueType: Use LaserWriter 6.1 Driver or Later

=====  
Article Created: 24 March 1991  
Article Last Reviewed: 15 July 1992  
Article Last Updated: 15 July 1992

### TOPIC -----

After installing TrueType software that ships with the StyleWriter (for use under System Software 6.0.7) I can't print to the LaserWriter using the LaserWriter 5.2 drivers. I keep getting a dialog box telling me to update my printer drivers.

Do I have to use the LaserWriter 6.0.1 driver if TrueType is installed?

### DISCUSSION -----

The TrueType software that comes with the StyleWriter or Personal LaserWriter LS printer requires the LaserWriter 6.1 driver or later. The driver is on the Macintosh Printing Tools disk that comes with the StyleWriter printer. Everyone on the network should upgrade together to the newest driver.

The LaserWriter 6.1 driver doesn't use the separate Laser Prep file required by previous versions of the LaserWriter driver. Instead the Laser Prep code is downloaded with every print job. Because of this, users of this driver will not have Laser Prep "wars" when new versions of LaserWriter drivers are installed.

There is a Laser Prep file on the above printing disk, but only for upgrading AppleShare Print Servers that makes them compatible with the new LaserWriter driver. Here is the path:

Macintosh Printing Tools  
    LaserWriter Utilities  
        For AppleShare Print Server

## Macintosh: Multi-line Dial-in Access Software

Revised: 5/11/94  
Security: Everyone

Macintosh: Multi-line Dial-in Access Software

=====

Article Created: 26 March 1991  
Article Reviewed/Updated: 11 May 1994

TOPIC -----

I'm looking for a multi-line remote-access AppleTalk server or bulletin board system for the Macintosh.

Also, how do I go about setting up such a system?

DISCUSSION -----

Multiple calls on a single phone number ("one-number access") are available from your local telephone company. This is the same service many businesses use for voice services.

Apple Remote Access MultiPort Server is a product from Apple that provides a flexible, scalable, and secure way to offer network access to large numbers of remote or mobile users. Used in conjunction with one or more Apple Remote Access Serial Cards, it allows a Macintosh computer or a Workgroup Server to support from 4 to 16 simultaneous dial-up connections.

On the client side users would have the Apple Remote Access Client for Macintosh software on their system to connect to a Apple Remote Access MultiPort server.

Another solution for allowing multiple dial up lines into an AppleShare network would be the use of network modems such as Shiva's NetModem. These modems are stand-alone AppleTalk devices that connect as a node. One NetModem would be required for each incoming line. Once connected, the computer dialing in would become a node on the network via the NetModem.

TeleFinder, by Spider Island Software, is a bulletin board program for the Macintosh that handles multiple callers. The program provides electronic mail (its own, not a gateway to other systems) and file transfers. It also sports a Macintosh interface: files and folders appear and behave much as they do in the Finder. And while Macintosh users have the benefit of a graphical interface,

other computer users can have access using text commands.

TeleFinder handles as many phone lines as host Macintosh memory and processing power allow: a standard Macintosh II with 8 MB of RAM could handle six lines at 9600 baud or twenty or more phone lines at 2400 baud. Be aware that the Macintosh cannot efficiently manage multiple serial port activity. Ten or more callers on one Macintosh will definitely result in significant performance degradation.

Multiport serial cards are available from Creative Solutions and Applied Engineering.

For more information, search on "MultiPort", "Shiva", "TeleFinder", "Creative Solutions", or "Applied Engineering"

Macintosh: Where To Find DRAM for Old-Style Video Boards

=====

Article Created: 27 March 1991  
Article Last Reviewed: 8 June 1992  
Article Last Updated:

TOPIC -----

I want to upgrade my old 4-bit video card to 8-bit. Apple's memory upgrade kit for the old video card is now off the price list. I assume that these are just standard 64K DRAMs. Can you recommend a third-party source?

DISCUSSION -----

The memory chips used to expand the old Macintosh II Video Card from 4-bit to 8-bit are not standard 64K DRAMs. VRAMs made by NEC were used on the board (part numbers: D41264C-12). The "-12" in the part number indicates that the chips have a 120ns rating.

Companies that sell these chips include:

- The Chip Merchant
- SHECOM COMPUTERS
- Peripheral Outlet

To locate a vendor's address and phone numbers, use the vendor name as a search string.

A/UX: Recover a Missing or Corrupted System Folder (5/95)

=====

Article Created: 29 March 1991  
Article Reviewed/Updated: 3 May 1995

TOPIC -----

If the System Folder, `"/mac/sys/System Folder"`, of an A/UX user gets accidentally thrown away in the trash, what System Folder can be used to replace the original contents? Are there any special files?

DISCUSSION -----

The A/UX command `"systemfolder"` can generate a clean personal Folder in the `$HOME` directory. The contents of the newly created personal System Folder will include generic files from the `"/mac/lib/SystemFiles/private"` and `"/mac/lib/SystemFiles/shared"` directories. Follow these steps:

- 1) Log on as `"root"`
- 2) Type the command `"systemfolder"`
- 3) If you receive the message, `"System Folder '/System Folder' already exists - updating"`, type the command: `mv "System Folder" "old system"`. Then type the command `"systemfolder"`
- 4) Logout as root and login as the user.
- 5) You have created a clean System Folder, and you can then copy the Extensions and Control Panels you want into the `"/mac/sys/System Folder"`.

Security: Everyone

Macintosh 8•24 GC Card: QuickDraw Printer Problem (11/94)

Article Created: 30 March 1991  
Article Reviewed/Updated: 07 November 1994

### TOPIC -----

I'm having problems printing from a Macintosh II with a Macintosh Display Card 8•24 GC connected to a LaserWriter SC. When acceleration on the Macintosh Display Card 8•24 GC is on, QuickDraw fill patterns aren't printing properly. I am running System 6.0.5 with LaserWriter SC driver 1.1.

If I turn off acceleration on the Macintosh Display Card 8•24 GC and restart, everything works fine. But restarting each time I want to print is not a satisfactory solution.

### DISCUSSION -----

After doing some testing, we discovered that this problem happens with any of Apple's QuickDraw printers. We have told Engineering about the problem and will announce a solution when we have it.

In the mean time, we suggest that you switch off the Macintosh Display Card 8•24 GC's acceleration before printing. You can do this using the card's Control Panel without rebooting or even quitting from an open application. We realize that this isn't a solution, but it is an adequate temporary workaround.

## Personal LaserWriter LS: About the Paper Feeder Accessory

Revised: 6/6/91  
Security: Everyone

Personal LaserWriter LS: About the Paper Feeder Accessory

=====

Article Created: 30 March 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I'm confused about the optional paper and envelope feeder for the Apple Personal LaserWriter LS.

Apple's price list states that the Personal LaserWriter LS requires a Personal LaserWriter LS Paper Feeder to accept the optional Letter, Legal, and Envelope cassettes.

I've read all the available Personal LaserWriter LS literature and can find no other mention of the Paper Feeder. Do I really need to get the Paper Feeder, and where do I get more information about it?

DISCUSSION -----

The Personal LaserWriter LS has two standard ways to feed-in paper:

- Manual feeding using the multi-purpose tray, or
- stacking 50 pieces of paper or less in the multi-purpose tray.

There is an optional, dealer-installable, Personal LaserWriter LS Paper Feeder that works with the Personal LaserWriter Letter Cassette, Personal LaserWriter Legal Cassette, or Personal LaserWriter Envelope Cassette.

You don't need the Personal LaserWriter LS Paper Feeder to use the printer. It is only necessary if you want to have a 250-sheet capacity Personal LaserWriter Letter Cassette or Personal LaserWriter Legal Cassette, or the handy Personal LaserWriter Envelope Cassette.

The Personal LaserWriter LS Paper Feeder documentation is in the Personal LaserWriter LS Owner's Guide on pages 79-86.

The Apple part number for the Personal LaserWriter LS Paper Feeder is M8028G/A.

The Apple Personal LaserWriter LS product sheet (M1076LL/A) mentions the Personal LaserWriter LS Paper Feeder under the "Related Products" section.

A/UX: How To Create Additional Swap on a Separate Drive

=====

Article Created: 30 March 1991  
Article Last Reviewed: 3 July 1992  
Article Last Updated:

TOPIC -----

I'm trying to tune an A/UX system for maximum performance. How do I set up swap space exclusively on a second drive? The way I'm doing it doesn't seem to "take hold".

System Setup: Macintosh IIIfx with 20MB RAM, A/UX 2.0.1, X Window System 2.1.

A/UX is on an external 1GB drive from MacinStor (set to SCSI 1) partitioned with SilverLining. The drive's default size swap partition (18MB) is at slice 1. To increase performance, I want to dedicate the Apple internal 80MB drive to swap.

Here's how I'm trying to do this:

- 1) I use Apple HD SC Setup to create custom partitions on the internal drive (SCSI 0, slice 1).
- 2) I boot A/UX off the external drive.
- 3) I log in as root and associate the new partition with a slice using the command: " pname -a -c 0 -s 1 Swap"
- 4) I added the new swap area with the command:  
"swap -a /dev/dsk/c0d0s1"
- 5) I reboot the system.
- 6) I run "swap -l" to list swap area status and only see  
/dev/dsk/c1d0s1 showing (the default swap area on the

external drive).

What else do I need to do? Do I have to manually add an entry to /etc/fstab for /dev/dsk/c0d0s1? If so, what parameters need to be set?

#### DISCUSSION -----

If you use Apple HD SC Setup to create a custom Swap partition on slice 1 (the default slice number in A/UX) you don't have to do "pname -a -c 0 -s 1 Swap" to associate that partition. The swap device /dev/[r]dks/cXdYs1 is the default recognition of A/UX.

To automatically add additional swap areas when booting A/UX, insert the following lines in /etc/rc:

```
# add additional swap area here
/etc/swap -a
```

Now insert the additional swap block device entry in the /etc/fstab. In your situation this is:

```
/dev/dsk/c0d0s1  ignore  swap  rw  ignore ignore
```

Macintosh: Remote Access to UNIX Servers

=====

Article Created: 1 April 1991

### Article Change History

-----

08/31/92 - REVIEWED  
o For technical accuracy.

### TOPIC -----

I want to access a UNIX server with my Macintosh using dial-up phone lines and modems.

What software do I need to do terminal emulation and file transfer?

### DISCUSSION -----

Many Macintosh communication programs, such as MacTerminal, MicroPhone, Smartcom II, Kermit, MacBLAST, VersaTerm, and so on, have VT100, VT52, VT102 terminal emulation. These programs also have file transfer protocols, such as X/Y/Zmodem, Kermit, MacBinary, and so on.

Most UNIX machines support these types of terminal emulation. As long as your UNIX machine has the same file transfer protocol (such as Kermit, or X/Y/Z Modem) as your Macintosh software, there should be no problem doing file transfers.

Macintosh: Compressed Digital Audio Access from LaserDiscs

=====

Article Created: 1 April 1991  
Article Last Reviewed: 14 July 1992  
Article Last Updated:

TOPIC -----

I'm interested in decoding "Time Compressed Audio" stored on a LaserDisc. This compression allows up to 300 hours of audio-only to be stored on a video LaserDisc.

Is there a Macintosh product for this purpose?

DISCUSSION -----

Fast Trax Digital Technologies, Inc. of Irvine, California sells encoder/decoder devices for the Macintosh and MS-DOS PC. The Macintosh needs only a software driver to use the equipment.

For more information, search on "Fast Trax".

Apple IIGS: Error 0C Indicates Sound Chip Problem

=====

Article Created: 14 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

My Apple IIGS (rev. 03 ROM) gives a self test error code of 0C000004, though everything seems to be working fine. What does this code mean?

DISCUSSION -----

Apple IIGS Tech Note #95 explains the diagnostics test:

AA = 0C  
DD = 01: RAM data error  
      02: RAM address error  
      03: Data register failed  
      04: Control register failed  
      05: Oscillator interrupt timeout

In your case, the problem is a control register failure, specifically a bad sound chip. Since the sound chip is not socketed, you will have to replace the logic board of the Apple IIGS.

## ImageWriter I: Compatible with Newer Macintosh Models (2/96)

Revised: 2/5/96  
Security: Everyone

ImageWriter I: Compatible with Newer Macintosh Models (2/96)

=====

Article Created: 15 April 1991  
Article Reviewed/Updated: 5 February 1996

TOPIC -----

I am having difficulty using a Macintosh Classic with a wide carriage ImageWriter I. Are there any known incompatibilities with old ImageWriter printers and the new computers or system software?

DISCUSSION -----

There are no known compatibility problems with the ImageWriter I and Macintosh computer with DIN 8 serial ports, if the current ImageWriter driver and the proper cables are used.

The current ImageWriter driver is version 2.7 for System 6 users and version 7.0.1 for System 7.x users. The correct cable configuration is to use the original Macintosh to ImageWriter DB-9 to DB-25 cable, part number 590-0169, with the DB-9 to Mini DIN 8 Macintosh Peripheral Adapter cable, part number 590-0553.

When using these cables and the current ImageWriter driver, the printer should work just fine.

## A/UX: Directories; 32-bit Clean Warning; Number of Procs (9/94)

Revised: 9/7/94  
Security: Everyone

A/UX: Directories; 32-bit Clean Warning; Number of Procs (9/94)

=====

Article Created: 16 April 1991  
Article Reviewed/Updated: 6 September 1994

TOPIC -----

Here are a few A/UX questions:

1. I've got an NFS server online. How do I export specific directories (/usr/catman, for example) without exporting root or /usr?
2. How do I prevent the "32-bit clean" warning (for Macintosh applications stored and launched under A/UX file system) without resorting to a ResEdit fix?
3. I know how to increase the maximum number of processes using kconfig. Is it possible to increase my maximum number of PTYs to 64?

DISCUSSION -----

1. All the NFS exported entries specified in the /etc/exports file are file system mount points. Currently, there is no way you can only "export" specific directories under a mounted file system.

We suggest you make and export a new file system for these specific directories.

2. SIZE resource is the only place to make this change. Here are two ways you can make a Macintosh application "recognizable" as a 32-bit clean so as not to get a "32-bit clean..." warning message everytime it is launched:

- use ResEdit
- or
- use "changesize +32BitCompatible file" command under CommandShell.

Changesize command sounds easier than ResEdit.

3. Yes, it is possible to change the maximum # of PTYs via kconfig.  
Just specify the NPTY=64 within kconfig.

## A/UX 2.0.1: Internet Forwarder Bug (8/94)

Revised: 8/24/94  
Security: Everyone

A/UX 2.0.1: Internet Forwarder Bug (8/94)

Article Created: 16 April 1991  
Article Reviewed/Updated: 23 August 1994

TOPIC -----

I'm trying to get an Internet forwarder running under A/UX 2.0.1. I have configured several systems the same way, with no luck. I've tried using a Macintosh IIx, a Macintosh IIci and a Macintosh IIfx, each with 2 rev K EtherTalk cards. The other systems on the networks include a Macintosh IIfx on each network and a Decstation 2100 and a MacBlitz card on the 192.33.20 network.

Here are the procedures I've been using in my attempts to bring up the forwarder:

- 1) Install the cards into the system.
- 2) Do a newconfig nfs and answer "n" to the YP client prompt.
- 3) Configure IP & broadcast addresses & netmasks for each card so /etc/NETADDRES file look like:

```
0 192.33.20.1 192.33.20.255 255.255.255.0
1 134.69.50.1 134.69.50.255 255.255.255.0
```

- 4) Set up my /etc/hosts file to include hosts on both sides of the router as follows:

```
0x7F.0x00.0x00.0x01 loop lo loo localhost
192.33.20.1 jabberwock #ae0 host reference
134.69.50.1 jabberwock1 #ae1 host reference
192.33.20.2 manticore
134.69.50.4 fredsys
192.33.20.200 dextra # decstation 2100
192.33.20.201 blitzoid # macblitz 50/8
```

5) Restart the system and verify that the following daemons are running:

```
/etc/portmap
/etc/inted
/etc/in.routed
/etc/nfsd 4 (4 of these)
/etc/biod 4 (4 of these)
/etc/rpc.lockd
/etc/rpc.statd
```

6) From system "manticore", which has an Internet address of 192.33.20.2, a broadcast address of 192.33.20.255 and a netmask of 255.255.255.0, I can ping jabberwock successfully on both sides (192.33.20.1 and 134.69.50.1). Additionally, I can rlogin to both sides of jabberwock (the /etc/hosts file contains EXACTLY the same info as jabberwock's) using "rlogin jabberwock" and "rlogin jabberwock1".

7) From system "fredsys", that has an Internet address of 134.69.50.4, a broadcast address of 134.69.50.255, and a netmask of 255.255.255.0, I can access both sides of jabberwock the same as I could from manticore. Again, the /etc/hosts file is identical to jabberwock's.

8) Neither ping nor Telnet nor rlogin is successful from manticore to fredsys or vice versa. The /etc/hosts files are the same on all three of these machines. All of the addresses match up as they should.

9) Verify the cables and terminations; check the interfaces with an ifconfig ae0 on all three machines and an ifconfig ae1 on jabberwock. All addresses and interfaces show up as they should, but to no avail.

10) At this point, I can't Telnet, ftp, ping or rlogin to fredsys from any system on the 192.33.20 network except jabberwock.

11) From jabberwock, I can ping all of the other systems on both nets. I can rlogin, etc. all of the other systems. I just can't cross the barrier from one net to the other.

Any suggestions?

#### DISCUSSION -----

With the above configuration, we have been able to reproduce your problem. On an A/UX 2.0.1 Internet forwarder/router, the host "manticore" on network 192.33.20 CAN'T talk to the host "fredsys" on network 134.69 via A/UX 2.0.1 Internet forwarder host "jabberwock".

With the same configuration, but with the Internet forwarder/router (jabberwock) running A/UX 2.0, the problem goes away. Hosts ("manticore" and "fredsys" in this case for example) on different networks via A/UX 2.0 router CAN talk to each other.

ComTalk and NFS: Compatibility Update

=====

Article Created: 16 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Can I get an update on APT's ComTalk AppleTalk & TCP/IP Routing products and the new NFS software compatibility?

DISCUSSION -----

NFS/Share from Intercon and Wollongong's NFS Client do not work across ComTalk gateways because of lack of support for splitting up and encapsulating larger UDP-type packets over AppleTalk/LocalTalk. These vendors are aware of this problem and are working on a fix. There are no problems supporting TCP-based services, such as Telnet, SMTP, FTP.

Other than this compatibility issue, these products are very fast, and have a comprehensive set of security options.

MacRecorder Driver 1.0: Incompatible with Macintosh Portable

=====

Article Created: 17 April 1991  
Article Last Reviewed: 28 July 1992  
Article Last Updated: 28 July 1992

TOPIC -----

I'm trying to use Farallon's MacRecorder with my Macintosh Portable running System Software 6.0.7. The files SoundEdit and HyperSound are working fine.

When I place the MacRecorder Driver in the System Folder and restart, the driver doesn't load (the icon appears with an 'X' through it).

DISCUSSION -----

The MacRecorder Driver 1.0 is not compatible with the Macintosh Portable. Version 1.0.2 is the latest version as of July 1992 and it is compatible with the Macintosh Portable and System 6.0.7.

Farallon has sold the MacRecorder software and hardware to MacroMedia (formerly MacroMind) and they're responsible for supporting the product now.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

Article Last Updated:

TOPIC -----

My Macintosh SE/30 is freezing up when I use it as a server and router (using an AppleTalk Internet Router and a Kinetics Ethernet card). Could it be that the 68030 Direct Slot card is interfering with the processor in some way?

DISCUSSION -----

We are not aware of any problems using the Macintosh SE/30 in the configuration you describe. The Macintosh SE/30-AppleShare-Router combination is freezing probably because of a problem with the Ethernet card's ADEV. We suggest you try reinstalling the ADEV and see if that solves the problem.

Macintosh: Where Changes Are Stored When a File Is Edited

=====

Article Created: 17 March 1991  
Article Last Reviewed: 8 October 1991  
Article Last Updated: 8 October 1991

TOPIC -----

For security reasons, I need to know where changes stored during editing of a document. Is there a temporary document created, or are the changes stored in RAM until I save or exit the document?

DISCUSSION -----

How a document stores changes varies depending on the manufacturer. For instance, MacPaint is a "RAM based" program and keeps its "changes" in the application heap space. MacPaint saves changes to disk only when you choose Save, whereas Microsoft Word buffers data to the disk.

Generally, if your program is creating "temp" files, it is writing changes to disk. For instance, with MultiFinder running, launch Microsoft Word and note how it creates a Word Temp file in the System folder. Quit Microsoft Word (saving your document using Save or Save As) and the "Word Temp" file disappears. Not all temp files are visible, and some applications may buffer data to disk without being so obvious.

If you must know if an application buffers user data to disk, ask the manufacturer of your software.

A related issue is the Virtual INIT and Virtual in System 7. By design, both programs buffer data to disk (but you have the option to turn them off).

Solana H Server: Problems with Large Phase 2 Networks

=====

Article Created: 17 March 1991  
Article Last Reviewed: 10 April 1992  
Article Last Updated: 10 April 1992

TOPIC -----

Is there a problem using Solana H-Servers on large multiple-zone AppleTalk Phase 2 networks?

DISCUSSION -----

There is a problem maintaining router tables on very large networks.

Occasionally, several routers can get their battery-backed RAM blown, though they still stay running from 30 minutes to several hours, depending on network traffic. When the routers finally start to go down, you'll begin to see erroneous, duplicated, and scrambled zone names and device names. Then all the routers will stop completely and begin flashing their error indicators.

You can restart the routers, but their routing tables will be scrambled. Each time you try restarting the problem only gets worse. Completely resetting PRAM only temporarily fixes the problem.

Solana has discontinued business to our knowledge, so we are unable to refer you to them directly for further information.

System 7: Workaround for 32-bit Incompatible Boards

=====

Article Created: 5 June 1991

### Article Change History

-----

08/21/92 - REVIEWED

- For technical accuracy; edited.

### TOPIC -----

If a computer is set to 32-bit mode under System 7 and has a 32-bit incompatible board installed, you get an error chime at startup and a sad Macintosh on the screen, or both. How do you fix the problem?

### DISCUSSION -----

To fix this, do the following:

- Remove the incompatible board or boards.
  - If you still have your video card installed (assuming it's not the incompatible card), start up from a 6.0.x floppy and you will get a dialog prompting you to change to 24-bit addressing.
- OR -
- If you don't have your video card, start up from your System 7 and reset the Parameter RAM by holding down Command-Option-p-r at start up.

These procedures will reset the addressing to 24-bit mode.

System 7.x: How to Prepare a Network Install Folder (2/95)

=====

Article Created: 5 June 1991  
Article Reviewed/Updated: 15 February 1995

TOPIC -----

Can the System 7.x Installer that is shipped on a floppy disk or CD ROM do a network install?

DISCUSSION -----

Yes. There is only one version of the Installer and it can be setup to perform a network installation. This same process works for all versions of System 7.

This is how you do it:

- 1) Create a folder called Net Install on a shared volume.
- 2) Drag all disk images needed for the installation (all disks except the Disk Tools disk) to the Net Install folder. A folder will be created inside the Net Install folder that corresponds to each diskette.
- 3) Drag the Installer and the Install script from the Install Me First or Install 1 diskette to the top level of the Net Install folder.
- 4) The Net Install folder is now prepared for remote users to use for performing system software installations. Once they log into the remote volume, they double click the Installer icon and the installation process will run.

System 7: Unmounting a Disk

=====

Article Created: 5 June 1991

### Article Change History

-----

07/08/91 - UPDATED

- To correct terminology.

08/24/92 - UPDATED

- With additional details from another article.

### TOPIC -----

How can I unmount a disk (floppy, server, or hard disk) and remove the disk image from the desktop, besides dragging it to the Trash? System 6.0.5 and System 6.0.7 eject a disk and remove its icon from the desktop when I press Option-Command-E.

This does not appear to work with System 7.0. All System 7.0 seems to support is Command-E, so you still have to drag an icon into the trash.

### DISCUSSION -----

Command-Option-E does not work in System 7.0. Command-Y has taken over that function.

Select the disk icon and either choose Put Away from the File menu, or use the keyboard equivalent, Command-Y.

Security: Everyone

System 7: Correction to Installer Message on Macintosh Plus

=====

Article Created: 11 June 1991  
Article Last Reviewed: 14 August 1992  
Article Last Updated: 22 August 1991

TOPIC -----

This is a notice about an incorrect message given by the System 7 Installer on a Macintosh Plus.

DISCUSSION -----

If customers attempt to install System 7 to floppy disks and choose "Minimal Installation for Macintosh Plus," the Installer screen INCORRECTLY reads as follows:

"This package contains the minimal set of system software for use on the Macintosh Plus. It is intended to create a high-density (FDHD) startup disk that will only be used with the Macintosh Plus."

This statement is incorrect. Aside from the hard drive requirement, users cannot install System 7 to high density floppy disks on a Macintosh Plus because there are no SuperDrives (FDHD 1.44MB) for the Macintosh Plus. The 1.44MB floppy drives are not supported by the Macintosh Plus ROMs.

Refer to the System 7 Installation manual, which states the hardware requirements--including a hard drive--to install System 7.

## System 7: Installing EtherTalk Phase 1 under System 7

Revised: 6/24/91  
Security: Everyone

System 7: Installing EtherTalk Phase 1 under System 7

=====

Article Created: 11 April 1991

### Article Change History

-----

08/24/92 - REVISED

- To include information from two other articles.

### TOPIC -----

Are networks running AppleTalk Phase 1 still supported under System 7?

If so, how do I install AppleTalk Phase 1 for Ethernet under System 7?

Where is the Phase 1 resource we are to use?

### DISCUSSION -----

System 7 automatically installs and supports AppleTalk Phase 2 networking software. If your network consists entirely of LocalTalk, PhoneNet, or TokenTalk (or some combination thereof), this has absolutely no impact on you and you don't need to read any further. Phase 2 software only affects networks that have EtherTalk.

But a Phase 1 EtherTalk driver that works with System 7 is available on the CD that comes as part of the System 7 Group Upgrade Kit. The procedure and software for installing Phase 1 under System 7 are contained on the CD, or on AppleLink.

The reason for this approach is that Apple is migrating the installed base to AppleTalk Phase 2. We want all new System 7 users to automatically have Phase 2 software on their Macintosh computers. However, some people will be installing System 7 on their existing Phase 1 networks, and they will need the Phase 1 EtherTalk driver until they have completed their migration to Phase 2.

The datalink software (EtherTalk and TokenTalk) included and installed with System 7 is Phase 2. However, a network of mixed Phase 1 and Phase 2 drivers can be implemented, provided the network administrator has set up the internet routers with the appropriate migration utility. Migration issues will affect only those networks using EtherTalk datalink software, because no version of TokenTalk predates version 2.0.

Network applications (like AppleShare File Server and Print Server software), system software, and its associated services are Phase independent. They can connect to and use services on any AppleTalk network.

The following is the Read Me file that is found on the Group Upgrade Kit CD:

#### EtherTalk Phase 1

-----

EtherTalk® software allows communication with AppleTalk® network services over Ethernet networking interface cards and media. EtherTalk Phase 2 software is part of Macintosh® system software version 7.0. This folder contains an earlier version of EtherTalk software, EtherTalk Phase 1.

You only need to install EtherTalk Phase 1 software for users who have Ethernet networking interface hardware and who are connected to a network that has not been upgraded to support AppleTalk Phase 2. AppleTalk Phase 2 transition and upgrade are discussed in the "System 7 Group Upgrade Guide."

To install the EtherTalk Phase 1 software, begin by installing the EtherTalk software as part of the System 7 installation procedure. Next, drag the EtherTalk icon to the icon of your System Folder (not the open System Folder window). It is automatically placed in the Extensions folder inside the System Folder.

To select the EtherTalk Phase 1 software, open the Control Panels folder, located in the System Folder. Double-click the Network control panel. Finally, select the EtherTalk icon.

## A/UX: Sendmail and Domain Name Server (8/94)

Revised: 8/24/94  
Security: Everyone

A/UX: Sendmail and Domain Name Server (8/94)

=====

Article Created: 30 March 1991  
Article Reviewed/Updated: 23 August 1994

TOPIC -----

How do I get "sendmail" to work under A/UX?

DISCUSSION -----

The version of "sendmail" in A/UX requires your local network to be running with Domain Name Server (DNS), which is /etc/named. The README file in /usr/lib/sendmail.conf directory describes in more detail the type of mailers currently supported.

Choose one of the machines on your network as a primary Domain Name Server to prevent any host name conflicts. (See the "Setting Up Network Mail" section in the "A/UX Network System Administration" manual on how to do this.)

The distributed sendmail.cf file included with A/UX doesn't work on every network.

After you have a Domain Name Server configured and running properly on the network, execute these commands to get sendmail working:

```
# CD /usr/lib
# kill -9 the-running-sendmail-process-id
# mv sendmail.cf sendmail.cf.orig
# mv sendmail.cf.NEW sendmail.cf
# rm -f sendmail.fc           # remove the old sendmail frozen file
# sendmail -bz               # create a new sendmail frozen file
# /usr/lib/sendmail -bd -q30m # restart the sendmail
```

To get all the domain names resolved with the domain name server machine, create a file called /etc/resolv.conf on the machines not running /etc/named.

Here is an example of the content of /etc/resolv.conf:

```
domain support.apple.com
nameserver 130.43.4.9
```

## Macintosh: How To Get Simultaneous RGB and NTSC Output

Revised: 6/18/92  
Security: Everyone

Macintosh: How To Get Simultaneous RGB and NTSC Output

Article Created: 14 April 1991  
Article Last Reviewed: 9 June 1992  
Article Last Updated:

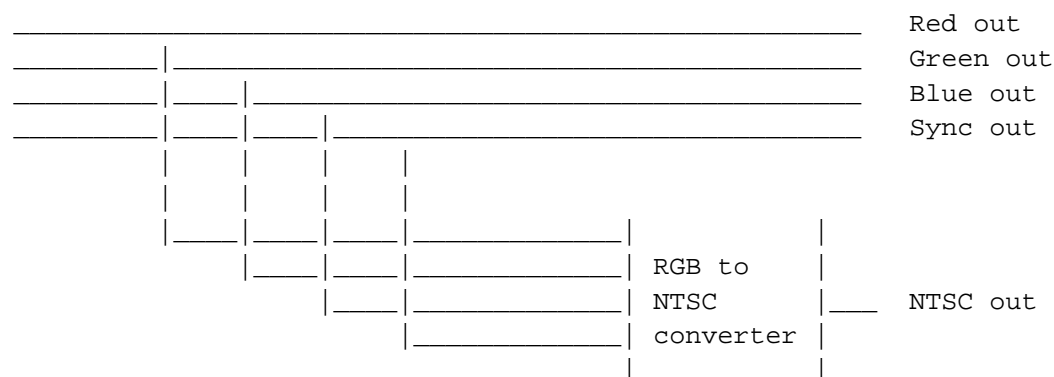

TOPIC -----

I'm trying to setup my Macintosh so it can simultaneously output an NTSC video signal for cable TV and an RGB signal for an Electrohome projector.

I've been able to do this by tapping the RGB signal from the Macintosh and feeding into a scan converter, but this creates a lot of interrupts on the projector.

I've been looking at NTSC boards, like the one from TrueVision, but these boards don't support simultaneous RGB output. What I need is a single board that outputs both signals.

Here's what I've been doing:

DISCUSSION -----

We doubt there is one video card available that provides simultaneous

Macintosh-style RGB (synchronization rate of around 31K) and NTSC signals (synchronization rate of around 15K).

However, if your Electrohome projector is a multi-sync RGB monitor that has NTSC sync timing, there are several options available. You can use a TrueVision NuVista card and have its RGB signal timed to the NTSC sync signal. Both the RGB signal and the composite signal are timed to the 15K sync of the NTSC specification. If your Electrohome projector has the ability to sync to NTSC timing, the Macintosh video output can go to the Electrohome as RGB and as composite NTSC for TV devices.

Here's the schematic:

The converters discussed below use this approach to drive both a RGB device and a NTSC device with the same video image simultaneously.

There are several cards that will work. The key is that the video card must be able to produce the NTSC sync timing to drive the converter.

- The NuVista+ (newer) or NuVista (older) with VIDI/O Box
- Several RasterOps video cards with their Video Expander Box
- The Macintosh Display Card 4•8, Macintosh Display Card 8•24, and Macintosh Display Card 8•24 GC with either the VIDI/O or Video Expander
- Any cards listed as compatible with VIDI/O or Video Expander

RGB devices used in this situation must be able to sync to the 15K NTSC timing produced by the video cards.

The TrueVision card has a variety of NuVista+ cables for connecting different products, including BNC, S-Video, composite (RCA style), and so on. The NuVista+ video card is like the VIDI/O Box on the Macintosh NuBus card: the card doesn't need a separate converter box.

Cables for the VIDI/O Box and the Video Expander Box use standard RCA style connectors for composite NTSC, standard S-Video connectors for the S-Video NTSC, and individual BNC connectors for the NTSC RGB. Depending on what you need, standard off-the-shelf cables may work, or you may need to create

custom cables.

## LocalTalk PC Card: LAP Driver (11/94)

Revised: 11/7/94  
Security: Everyone

LocalTalk PC Card: LAP Driver (11/94)

=====  
Article Created: 23 April 1991  
Article Reviewed/Updated: 22 July 1993

### TOPIC -----

Is there a driver for the old LocalTalk PC Card now called the PhoneNetTalk PC Card from Farallon that will give my software raw LAP packets? I don't want a DDP interface like ATALK.SYS. The Clarkson packet driver, "localtlk", doesn't do what I want because it has a packet interface that uses ATALK.SYS and gives IP packets. What I need are raw LAP packets.

### DISCUSSION -----

We haven't seen a driver that has LAP level packets, but there is a source of information available that may help. The APDA document, "LocalTalk PC Card and Driver Preliminary Notes" (APDA part number M7055), describes how to write low-level software to control and communicate with the card. The note contains sample code in C and detailed information about programming.

For specifics on other cards, you'll need to contact the manufacturer. We suggest you contact DayStar Digital, Inc. on the LT200, and Sun Select (formerly Sitka Corp.) about the FlashCard. Also contact Farallon for information on the PhoneNetTalk PC Card.

To locate a vendor's address and phone numbers, use vendor name as a search string

## Macintosh Portable: RAM Upgrade Card Issues

Revised: 7/28/92  
Security: Everyone

Macintosh Portable: RAM Upgrade Card Issues

=====  
Article Created: 20 April 1991  
Article Last Reviewed: 28 July 1992  
Article Last Updated:

TOPIC -----

- 1) Can I use a PDS Memory Card with a third-party RAM Slot memory card?  
The information available in the TIL suggests that the Apple Memory Card should be removed if a PDS Memory Card is in use. If third-party cards will work, which ones do you recommend? Can you be more specific regarding the problem with the memory decode chip?
- 2) The Pseudo Static RAM cards are not compatible with older versions of the Macintosh Portable. Is this because of different pinouts on the new logic board or because of Pseudo Static RAM?
- 3) With an upgraded Macintosh Portable, will both the RAM slot and PDS memory cards work? Will Pseudo Static memory work in the upgraded system?
- 4) What is the maximum amount of RAM that is supported in the Macintosh Portable's RAM slot?

DISCUSSION -----

- 1) PDS memory cards are compatible with third-party RAM Slot memory cards. PDS cards do not use the Apple Memory Decode Chip, so there are no compatibility problems. Any third-party card designed for the new Macintosh Portable should work. Contact the card's manufacturer for compatibility information before buying.

The only memory card affected by the memory decode chip problem is Apple's. When an Apple 1MB or 3MB PSRAM Memory Board is installed, you cannot use the PDS for RAM expansion. The Apple card will try to decode memory accesses above the 4MB boundary.

- 2) The pseudo static RAM of the upgraded Macintosh Portable requires a refresh line. SRAM cards designed for the original Macintosh Portable will not work with the new Macintosh Portable.
- 3) The Backlit Upgrade consists of a new bezel (including display) and a card that goes into the ROM slot that powers the backlit display. PDS cards and RAM from the original system will work in the upgraded system.
- 4) For the new Macintosh Portable, the RAM slot can support up to 3MB of PSRAM, with 1MB soldered on to the main logic board. The PDS card can support up to 7MB of RAM (provided the Apple Memory Card is not used) making for a grand total of 8MB for the system.

## MacX: Default Color Map Is Macintosh System Palette

Revised: 4/22/93  
Security: Everyone

MacX: Default Color Map Is Macintosh System Palette

=====

Article Created: 20 April 1991

### Article Change History

-----

04/21/93 - UPDATED

- To include MacX 1.2 information.

### TOPIC -----

When trying to plot a color bar of 256 colors, MacX shows me a full range of colors on the left side of my screen (colors 0 through 128, or so), but shows only a solid color on the right (colors 128 to 256). When printing to a Tektronix color printer, the screen dump routine returns a mirror message "130 colors found". This occurs in both rooted and rootless windows.

The color bar is complete (256 colors) on both the screen and printer when running White Pine's Exodus II and matches the color table of the host.

Why isn't MacX displaying all the colors?

### DISCUSSION -----

There are many X client applications that use the standard or default X color map. MacX uses the standard Macintosh System palette as the default color map (which it should), though this can lead to the situation you describe. The System palette has 128 colors locked in and no additional colors specified.

If you, using the X client application, request a new color map from MacX, you should get all 256 colors.

In MacX 1.2 loading the standard color map is an option in the display

preferences dialog.

## MacX: Using with Motorola X Clients

Revised: 4/20/93  
Security: Everyone

MacX: Using with Motorola X Clients

Article Created: 26 April 1991

### Article Change History

-----  
04/20/93 - REVIEWED  
• For technical accuracy.

### TOPIC -----

I'm trying to have session using MacX 1.1 and MacTCP Tool 1.1 with a:

- Motorola 8640
- UNIX SVR3.2
- X11R3

My MacX application opens fine, but when I try to execute any X sessions, I get the error message:

The remote command "xclock" could not be executed using the tool "MacTCP Tool". Creation of the remote stream failed. The connection came up halfway then failed."

Users can create a X session on the Motorola box and send it to the MacX screen via the 'setenv' command. However, the session executed and sent to the Macintosh doesn't fit on a less than 19-inch Macintosh monitor.

What configurations does the Motorola box need:

- via /usr/etc/n.rexecd?
- via /etc/hosts.equiv?

Are there compatibility issues running a MacX X11R4 server against an X11R3 client?

### DISCUSSION -----

This scenario sounds familiar. Your problem is most likely with the remote host, the "rexecd" service not functioning properly, or some restriction while executing the "rexecd" command.

We knew this was happening on some of Sun's systems. Sun implemented a "feature" in their "rexecd" code that doesn't allow a host (that isn't listed in the /etc/hosts file) to execute the "rexecd" command. The solution is to add the Macintosh IP address and host name to the Sun's /etc/hosts file.

If /etc/hosts file is not the issue, check to see if the "rexecd" service is available. Usually, the Internet Server database is kept in the /etc/servers file, in A/UX for example, an entry would look something like this:

```
exec    TCP    /usr/etc/in.rexecd
```

and the official Internet Service name database is kept in the /etc/services file, an entry in A/UX for example looks something like:

```
exec    512/TCP
```

The "rexecd" daemon uses a TCP protocol and listens on port number 512.

Regarding the Macintosh monitor problem, what was the X client's "geometry" specification on the command line? This display problem can happen if the "geometry" is specified to be larger than the display size of the MacX. If no "geometry" is specified, the default geometry is taken from the application. Try to specify the "geometry" within the size of the MacX display.

We don't think there is a compatibility issue for a MacX 11R4 server running against an X11R3 client.

## AppleShare PC: 7.0 LaserWriter Driver Not Required

Revised: 6/24/91  
Security: Everyone

AppleShare PC: 7.0 LaserWriter Driver Not Required

=====

Article Created: 26 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Do AppleShare PC users need to use the 7.0 LaserWriter driver? Is this a question that should be addressed to Farallon?

DISCUSSION -----

AppleShare PC has no need for the 7.0 LaserWriter driver or its prep information (also called Laser Prep, md, or Macintosh Dictionary).

When AppleShare PC prints to a LaserWriter, it uses one of two methods, depending on how it's connected. If it's set up for Epson LQ-2500 emulation, an emulation dictionary downloads with each job. This doesn't interfere with md (if it is present) and is purged at the end of the job.

If AppleShare PC is set up for PostScript printing, no dictionaries download at all. Only data made by the MS-DOS application are used. These data pass directly to the LaserWriter without changes. These data can cause problems depending on the application's print driver requirements. We haven't yet done any testing yet but don't expect any compatibility problems.

Personal LaserWriter NT: "setprintername" Character Restrictions

=====

Article Created: 26 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Using a Personal LaserWriter NT, I am trying to change the network name and type of the printer. To do this, I'm using the PostScript code:

```
-----
%!
serverdict begin 0 exitserver
statusdict begin
(Print Station:CuccaPS) setprintername
end
-----
```

This code works fine for the LaserWriter Plus and LaserWriter IINT, but not the Personal LaserWriter NT. Can the Personal LaserWriter NT change its network type?

DISCUSSION -----

The PostScript setprintername operator was not designed for changing the LaserWriter's type. The operator should not allow any of these characters as valid string components:

: @ \* =

While these characters may not always cause errors on older LaserWriters, they do cause unusual behavior with the Personal LaserWriter NT. They are invalid characters because they are field separators and wildcards, as defined by the AppleTalk Name Binding Protocol (NBP).

The format of an NBP entity name (such as a LaserWriter's Printer Access

Protocol server) is:

object:type@zone or Etch A Sketch:LaserWriter@Bandley3

If the ":" character were part of a LaserWriter's name, software attempting to address the LaserWriter would become confused and not know where the object's name leaves off or the type begins.

With the Personal LaserWriter NT, the setprintername operator is only able to change the object name. This forces the entire string into the object entry. Because the ":" character is invalid, the product operator must be used to obtain a valid AppleTalk name.

The LaserWriter Namer utility (shipped with each LaserWriter) prevents users from defining names with invalid characters. But not all PostScript interpreters enforce this restriction properly.

## Hayes InterBridge: Limits

Revised: 6/24/91  
Security: Everyone

Hayes InterBridge: Limits

=====

Article Created: 26 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

It appears that my Hayes InterBridges can't handle lots of zones with long zone names. The InterBridges only process one packet per reply for zone information. People on the other side of the Hayes InterBridges can see only 150 zones out of 183.

DISCUSSION -----

The 150 zone limit you've discovered is a characteristic of Hayes Phase 1 InterBridges.

|                                    | Phase 1 | Phase 2 |
|------------------------------------|---------|---------|
|                                    | -----   | -----   |
| Maximum number of zones            | 150     | 250     |
| Maximum number of networks         | 300     | 500     |
| Current ROM version of InterBridge | 1.12    | 2.10    |

Long zone names are not a problem with Hayes InterBridges as they will support zone names of any length.

## A/UX 2.0: Toolbox Shutdown Manager Routines Correction (4/95)

Revised: 4/26/95  
Security: Everyone

A/UX 2.0: Toolbox Shutdown Manager Routines Correction (4/95)

Article Created: 26 April 1991  
Article Reviewed/Updated: 26 April 1995

TOPIC -----

Using A/UX 2.0, I want to run a self-written program as a stand-alone application without the Finder. When I change the "mac32" startup script to "/mac/bin/startup -f ApplicationName &" things work fine except for the logout. Because the 'ExitToShell' procedure doesn't do a logout, I tried using the Shutdown Manager routines.

The "A/UX Toolbox: Macintosh ROM Interface" documentation mentions that the A/UX Toolbox routines 'ShutDwnPower' and 'ShutDwnStart' do an exit to the user's login shell. I've tried using both routines, but they work just like normal Macintosh Toolbox routines (in other word, they shutdown and restart the machine).

DISCUSSION -----

First of all, one minor correction: /mac/bin/startup SHOULD BE either /mac/bin/startmac or /mac/bin/startmac24

The "ShutDwnPower" and "ShutDwnStart" routines documented in the "A/UX Toolbox: Macintosh ROM Interface" are WRONG! The routines behave the same as Mac OS Shutdown Manager routines (shutdown and restart).

To Logout from user's login shell, use the AUXDispatch() trap with the A/UX\_LOGOUT selector. All definitions for the AUXDispatch trap are specified in the header file /usr/include/mac/aux.h.

For more detailed information about AUXDispatch trap, please refer to page 3-15 on "A/UX Toolbox: Macintosh ROM Interface" documentation.

## DECnet: Tunneling and Network Traffic

Revised: 6/25/91  
Security: Everyone

DECnet: Tunneling and Network Traffic

=====  
Article Created: 27 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Using PATHWORKS and DECnet tunnels, I am trying to set up a 23-location WAN. I have a star and a central VAX at the home office. I'm going to use existing 9.6Kb DECnet links because I expect to do night time downloads only.

- 1) What would the RTMP traffic look like over the DECnet links assuming I have around five routers in the home office? Do the half routers on each VAX exchange routing table information?
- 2) Is there internal tunnel maintenance traffic outside of the standard AppleTalk traffic?
- 3) Anything else to look at?

DISCUSSION -----

- 1) With DECnet Tunneling, each VAX on each side of the tunnel is an AppleTalk half-router for routing AppleTalk traffic over DECnet. Since AppleTalk for VMS version 3.0 is a full implementation of AppleTalk Phase 2 protocol stack on VAX/VMS, the RTMP traffic will be similar to any other AppleTalk network. And because half-routers are logically a full router, they periodically broadcast and receive RTMP Data packets to and from all other routers on its directly connected networks, backbones, or the DECnet links.
- 2) Within the Tunnel traffic, there should not be any other traffic besides the standard AppleTalk traffic. The Tunnel is made up of DECnet logical links, so it needs all the DECnet maintenance traffic (such as circuit hello and listen traffic) to be maintained.

3) With AppleTalk for VMS 3.0, we strongly recommend that your wide-area link is at least 56KB or higher. Though you don't expect a high traffic load, we are not clear on how you will do the night time download. If your network has any delay longer than two minutes, you might have problems with AppleShare. If the ASP session timer of two minutes expires, the session terminates and you lose the server connection.

Another problem may be with NBP lookup. Users might not see the file server when opening the Chooser and selecting the AppleShare icon. Some sites have to change a resource, called GNRL, to increase the Chooser interval timer and retry timer values. You can find a complete description of these two problems in the Tech Info Library on AppleLink. Search using keywords "AppleTalk and Wide and Area".

The other thing to look into is the capability of the central VAX since it serves as a single-point hub to the other 23 nodes. Does it have enough power to provide satisfactory performance?

Since you already have DECnet links, we suggest bringing up one tunnel at a time and stress test it with typical file download. Keep adding tunnels to see if performance remains acceptable. You might find that, at some point, you will want to add resources to the central VAX and/or increase the speed of the communications link.

## Macintosh System 6.0.x: Don't Begin File Name with Period

Revised: 6/25/91  
Security: Everyone

Macintosh System 6.0.x: Don't Begin File Name with Period

=====

Article Created: 27 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Using System Software 6.0.7, I create a file and name it ".temp". If I select the file and try to duplicate it with the Finder "Duplicate File" command, it won't. The screen blinks then comes back. If I keep trying to duplicate the file, the Finder bombs.

DISCUSSION -----

Apple is aware of this problem, which has to do with a patch to the "Open" trap for the Slot Manager. The Slot Manager assumes that all attempts to open a file that has a period ('.') as the first character in its name is a driver for a NuBus card.

This will always be a problem with System Software 6.0.x-based Macintosh systems. There are no workarounds that we are aware of except not using a period as the first character in a file name.

System Software 7.0 has a call that prevents this problem from happening. The call that causes the problem is "FSOpen". The new call is "OpenDF" and will be documented in Inside Macintosh Volume VI. The difference between the two calls is that FSOpen can open both files and devices; OpenDF can only open files.

This problem will still happen in System 7.0 if the old call is used. This will be the case with all existing applications and possibly new applications for System 7.0 specifically. Both calls will work under System 7.0. We recommend that developers use the new calls for their System 7.0 applications.

## DAL: MVS Server Questions

Revised: 7/9/92  
Security: Everyone

DAL: MVS Server Questions

=====  
Article Created: 27 April 1991  
Article Last Reviewed: 7 July 1992  
Article Last Updated: 7 July 1992

TOPIC -----

I have a few questions about DAL for MVS specifically relating  
to the MVS/TSO DAL Server:

- 1) What is the overhead of DAL on the Host, both disk blocks (space)  
and memory while running?
- 2) In what form or where does the Server run on the IBM Host?
- 3) How does DAL deal with security packages such as ACF2?
- 4) I'm using EDS Net to navigate through the network to the host. How  
do I configure a DAL application, such as one of the Query packages, to  
navigate through the EDS network parameters?

DISCUSSION -----

- 1) To install and use DAL, you need:
  - Any release of MVS that supports DB2 Version Release 3 or higher
  - 52 tracks of available space on a 3380
  - TSO logins with at least 2048K of memory
  - Either the DB2 DSNLOAD library allocated to native TSO or these  
modules copied to the load library containing the DAL load modules:
    - DSNACAB
    - DSNACAF

- DSNALI
- DSNHLI2
- DSN3ID00.

- Appropriate hardware and software for the supported network connection.

Keep in mind that large database queries can create temporary datasets on disk, but they are erased after the query is complete.

2) DAL will run in the users TSO address space. Each user needs a TSO id.

3) We have a number of customers using DAL that have ACF2 on their systems and they coexist without any problems. ACF2 has to be set up to support the RACROUTE call. This call is standard so it is likely that the customer's ACF2 is already set up to support it.

4) We don't know how to configure DAL to work within these parameters. If EDS Net doesn't support Macintosh-to-host using one of the connections listed below, DAL probably won't work in that environment:

- Apple Coax/Twinax Card connection using Apple MacDFT.
- Apple TokenTalk Card NB connection using Apple MacDFT
- Apple Serial NB Card connection using Apple MacDFT.
- Netway 1000/2000 connection.
- Avatar MacMainFrame connection.
- DCA MacIrma connection.
- SNA•ps 3270 Gateway connection.
- Asynchronous dial-in to a protocol converter (as long as the protocol converter accepts VT100 terminal type input).

## DAL: How It Checks Communication Lines for Errors

Revised: 7/9/92  
Security: Everyone

DAL: How It Checks Communication Lines for Errors

=====

Article Created: 27 April 1991  
Article Last Reviewed: 9 July 1992  
Article Last Updated: 9 July 1992

TOPIC -----

I'm using a Macintosh DAL client to have sessions with a DAL server running on a VAX (asynchronous) and an IBM 3090 with a 3270 card. Does DAL implement an error free data link on top of the communications channel so that glitches in the data flow do not effect the results of a query?

DISCUSSION -----

Data Access Language does not add error checking on top of the transport data link. That would produce unnecessary overhead. Instead, DAL uses the error checking provided by the transport methods. On asynchronous lines, it can specify parity, databits, stop bits, flow control, packet length, modem timeout, and dial attempts. For AppleTalk connections, DAL relies on ADSP to handle errors, and for 3270 connections, DAL uses the 3270 display station protocol (LU2) or the APPC (LU6.2) protocol.

MacX: "Bad STARTFONT" Statement Error Caused by Lower Case Type

=====

Article Created: 27 April 1991

### Article Change History

-----

04/20/93 - REVIEWED  
• For technical accuracy.

### TOPIC -----

I cannot seem to get MacX 1.0.1 to compile BDF fonts properly. MacX keeps converting the fonts into 0 byte files and complains about a "Bad STARTFONT statement".

### DISCUSSION -----

We tried compiling one of the sample BDF files under MacX 1.0.1 without any problems. The first line in the BDF file must be ALL UPPER CASE, such as "STARTFONT 2.1". Otherwise, you will get the "Bad STARTFONT statement" message.

A/UX: Correction to "A/UX Programming Language and Tools" Manual

=====

Article Created: 27 April 1991  
Article Last Reviewed: 31 August 1992  
Article Last Updated: 31 August 1992

TOPIC -----

I've noticed an error in the A/UX Programming Language and Tools, Vol. 2, chapter 25, page 5, section 13. The sample doesn't work at all, and there is a bug in the first and third line.

For example, try this source code (test.c):

```
char *_Version_ =  
    "(c) Copyright 1986\  
    Standard Software Version V.2.1";  
main  
{  
    printf ("hello world\n");  
}
```

compile it with: cc test.c  
then get the version number with : version a.out  
but no version number is available

Who can explain to me how to correctly use the 'version' utility, that is, how to create a string variable to be used by version utility?

DISCUSSION -----

First of all, the example in the "A/UX Programming Language and Tools. Vol. 2, Chapter 25, Section 13, page 5" is INCORRECT. The same is also true for volume one of the manual.

The version program attempted to look for a string of the following form:

```
{Apple version RELEASE.LEVEL YY/MM/DD HH:MM:SS}
```

where the capitalized words(RELEASE, LEVEL, YY, MM, DD, HH, MM, SS) are matched by numbers. Both RELEASE and LEVEL numbers can be up to 8 digits in length, the rest (YY, MM, DD, HH, MM, and SS) must be EXACTLY 2 digits. Both "{" and "}" symbols, and "Apple version" words are also required to match. Only one SPACE is allowed before words RELEASE, YY, and HH.

If the defined character string for version does not meet any of the above matching criteria, the 'version' program will display "no version number found".

The above character string, for example, should be changed to:

```
char *_Version_=
    "(c) Copyright 1986\
    {Apple version 2.1 86/09/12 18:05:24}";
```

This has been fixed in the A/UX 3.0 documentation.

A/UX: Using A/UX as a Print Spooler (8/94)

Article Created: 27 April 1991  
Article Reviewed/Updated: 23 August 1994

TOPIC -----

I'm running A/UX on an Macintosh IIfx. I'm using "lpr" to print to a LocalTalk LaserWriter. I also have HP/Apollo workstations on the same Ethernet. I want to print to the LaserWriter from the HP. My file goes to the A/UX spool folder, but needs to be printed by A/UX. How do I print directly to the LaserWriter from another IP node?

DISCUSSION -----

For the HP (or any other IP node) to print to a LaserWriter connected to the A/UX box, you have to edit the /etc/printcap file of the remote system to reflect the A/UX system. It should have an entry like this:

```
remote:\
    :lp=:\
    :rm=a/ux.hostname:\
    :rp=lp:\
    :sd=/usr/spool/remote:
```

The above entry brakes down as:

Line 1: Name by which the HP calls the A/UX system's printer

Line 2: Local printer designation

Line 3: Remote host name. This must also be in the host config file (/etc/hosts or equiv)

Line 4: Name of printer on the A/UX system. By default, this will be lp for a Chooser selected printer.

Line 5: Spool directory. This is a directory where remote print jobs will be

spooled. Instructions on how to set this up follow.

To create the spool directory, do this:

```
(1)  mkdir /usr/spool/remote
      chmod 755 /usr/spool/remote
      chgrp daemon /usr/spool/remote
      chown daemon /usr/spool/remote
      CD /usr/spool/remote
      mknod pipe p
      chmod 660 pipe
```

(2) Next, verify the /etc/hosts file on the HP that contains an entry which allows access to the A/UX system. It should look like:

```
134.66.20.45    aux_hostname  aux_hostname.domain.com
```

The first entry is the IP address of the A/UX system. The second entry is the hostname of the A/UX system, and the final entry is the hostname and domainname of the A/UX system (optional if domain name servers are not being used).

(3) Finally, you must tell the A/UX system that it can accept print requests from the HP system. To do so, edit the /etc/hosts file on the A/UX system so that there is an entry for the HP. The format will be as shown above.

Next, add the HP's hostname to the /etc/hosts.lpd file on the A/UX system. If the A/UX box has not yet been set up for remote printing access, the /etc/hosts.lpd file will not yet exist. Create it and enter the HP hostname.

Now to invoke remote printing on the LaserWriter from the HP, use the lpr command as follows:

```
lpr -Premote filename_to_be_printed
```

Also, the newly created pipe in /usr/spool/remote MUST be owned and grouped by "daemon", otherwise, it won't be opened by the spooler.

```
chown daemon pipe; chgrp daemon pipe
```

Apple PC 5.25 Drive: Compatibility with Macintosh Computers

=====

Article Created: 15 April 1991  
Article Last Reviewed: 19 June 1992  
Article Last Updated: 22 August 1991

TOPIC -----

Which Macintosh computers support the Apple PC 5.25 Drive?

DISCUSSION -----

The Apple PC 5.25 drive is supported only by the Macintosh SE and the Macintosh II, systems that were introduced without the Apple SuperDrive (formerly Apple FDHD).

Later versions of Macintosh computers have the Apple SuperDrive, which supports 3.5-inch MS-DOS diskettes--eliminating the need for the Apple PC 5.25 drive.

For customers who need to use 5.25-inch MS-DOS diskettes, we suggest looking at third-party products, such as those made by Dayna Communications.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

Security: Everyone

ImageWriter LQ: When Top Margin Increases with Each Page

=====

Article Created: 15 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I'm manually feeding a multi-page document through my ImageWriter LQ. The margins in Page Setup are set correctly at 1 inch, top and bottom. The paper size is correctly set to Letter, 8 1/2 x 11 inches.

The first page comes out fine, but all the other sheets' top margin increases by 1/2 inch.

DISCUSSION -----

This problem is usually caused by the Manual Feed option not being selected in the Print dialog box. The printer assumes that it should not do a backfeed, and increases the top margin on each page. (Also be sure that the DIP switch 2-8 is set to Open.)

There is something else you might try: Select the Macintosh Print dialog box by holding down the Shift key while selecting Print from the File Menu. This allows you to use the Macintosh print drivers. When you select print without holding down the Shift key, you are accessing the application's print driver.

Synchronous and Asynchronous Communication Defined

=====

Article Created: 29 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

What is asynchronous communication and how is it different from synchronous communication?

DISCUSSION -----

Synchronous transmission means both the sending and receiving devices are on the same frequency. This method uses precise timing for error checking.

Asynchronous transmission sends each byte of data with a start bit at the front and a stop bit at the end. Timing is variable and is not used for error checking. Asynchronous transmission is a less sophisticated way to send data, but less complex and less expensive.

## MacBinary: File Format Description (11/95)

Revised: 11/22/95  
Security: Everyone

MacBinary: File Format Description (11/95)

Article Created: 29 April 1991  
Article Reviewed/Updated: 22 November 1995

TOPIC -----

This article contains a brief description of the MacBinary file format. A detailed description and technical information is available from APDA.

DISCUSSION -----

Overview  
=====

Because of the way the Macintosh file system keeps track of files, there was a need to provide this tracking information when transmitting files through a modem. A committee was established, which developed the original MacBinary and later the MacBinary II format. These two formats remain functionally identical, however the MacBinary II format added additional information to maintain the integrity of the file system information.

Macintosh Files  
=====

Every Macintosh file contains two parts; a resource fork, which contains data used by an application, such as menus, fonts, and icons, and a data fork, which contains data specific to an application.

Originally, telecommunication programs only sent one part of a Macintosh file (the data fork). This meant that when a binary file was transferred from a Macintosh it lost its icon, and Type & Creator information. Since this information is important to the Macintosh file system, MacBinary was developed.

MacBinary  
=====

MacBinary is not a transfer protocol like Xmodem, Kermit, or Zmodem. Instead, it is used in conjunction with a transfer protocol, however it is independent of that protocol. MacBinary is very important when binary files are placed on a BBS (Bulletin Board Service), since a BBS can be run from any type of computer and Operating System, not just a Macintosh computer.

MacBinary consists of 128 bytes, which are added to beginning of any file sent through a modem. Most Macintosh telecommunication programs (terminal applications) automatically use MacBinary when a binary file is sent. Most applications also allow you to turn off MacBinary. If you are sending a binary file such as a TIFF or JPEG file to someone who uses a Windows computer, you must turn off MacBinary. If you do not turn off MacBinary, the additional 128 bytes at the beginning of the file will corrupt the file. There are ways of removing the MacBinary information, but most of these are designed for Macintosh. At one time there were a couple of MS-DOS terminal programs that automatically detected MacBinary files and stripped off the first 128 bytes of the file.

#### MacBinary vs. BinHex and UUencode

=====

MacBinary, unlike BinHex or UUencode, does not convert the data into a text representation of the binary data. This is important when you want to send a binary file to someone through a an e-mail system. Most e-mail systems do not support MacBinary, so you should use BinHex or UUencode instead. The Tech Info Library articles "What is Binhex & Where To Obtain It", and "UUencode & UUdecode: Explained" provide additional information on UUencode and BinHex. These articles can help you decide the best way to send your files through e-mail systems. If you are placing binary files such as applications, compressed binary files (StuffIt, Compactor), or other Macintosh specific binary files on a remote file server or FTP site here is a chart that can help you determine if you need to use MacBinary or not.

#### Begin\_Table

| Primary users  | MacBinary | Examples                         |
|----------------|-----------|----------------------------------|
| =====          | =====     | =====                            |
| Macintosh      | Yes       | Applications, Control Panels     |
| MS-DOS/Windows | No        | GIF, TIFF, QuickTime, MIDI files |
| Mixture        | No        | GIF, TIFF, QuickTime, MIDI files |

Security: Everyone

Macintosh System Software: Use Installer, Don't Drag-Copy

=====

Article Created: 15 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Is it really necessary to use the Installer application to put a new System on a Macintosh? What's wrong with just dragging over a good System Folder from another computer?

DISCUSSION -----

Drag copying System Folders is not an acceptable method of replacing System files. You must use the Installer to get a complete and successful installation of all necessary visible and invisible System files. There are hooks and patches to the ROM that can be part of the System only if the Installer is used.

If you have a System that was installed by drag-copying, we suggest that you trash it and install a fresh System Folder using the Installer program.

Macintosh Plus: Allow 30 Seconds for SCSI Devices to Start Up

=====

Article Created: 29 April 1991  
Article Last Reviewed: 27 July 1992  
Article Last Updated:

TOPIC -----

I have four SCSI hard disks daisy chained to a Macintosh Plus. On startup, only some of the hard disks mount, though they all mount when hooked up individually.

I've removed all internal terminators and replaced them with external ones, disabled all INITs, and checked the SCSI device numbers, all to no avail.

DISCUSSION -----

This is a problem cause by the relatively slow speed of Macintosh Plus computers with old-style ROMs. All SCSI devices must be in the ready state before the computer or they won't be recognized. Be sure to wait around 30 seconds after turning on your hard drives before turning on the Macintosh Plus. You also might consider upgrading your Macintosh Plus' ROM.

Also, just for the sake of consistency, standardize on one brand/type of SCSI terminator.

LaserWriter: Page Count Cannot be Reset (12/94)

=====

Article Created: 30 April 1991  
Article Reviewed/Updated: 06 December 1994

TOPIC -----

Is there any way to reset the page counter on a LaserWriter I/O board? I received one that did not show zero pages and it is going into a new engine.

DISCUSSION -----

The page count number is intended to be a permanent record showing the number of pages processed by a particular print engine. The page count is comparable to the odometer in a car showing the number of miles travelled.

In an effort to prevent misuse, Adobe Systems withheld the publishing of any methods for resetting the page count on PostScript printers using their code. Although there are legitimate reasons for resetting the page count, Adobe and Apple will not publish this information.

In order to properly track the page count for maintenance purposes, it is recommended that you place a sticker inside the printer which notes the date and the page count when the printer was serviced. This will help ensure that the ozone filter and other consumable items are replaced at the recommended intervals.

LaserWriter II: Minimum Paper Length is 6 Inches

=====

Article Created: 15 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I'm trying to manually feed 8.5 x 5.5-inch paper into a LaserWriter IINTX. I keep getting the jam alarm as the paper reaches the fuser. (The paper is not actually jammed but the electronic sensor thinks it is.) Is my paper too short?

DISCUSSION -----

The minimum paper length for the LaserWriter II engine is very close to 5.5 inches. At 5.5 inches, the paper has already left the feed rollers in the transfer guide assembly and may not be suitably fed into the fuser assembly. As the fuser cannot pick up the paper, a jam alarm goes off. Our measurements suggest that six inches is the minimum length for printer paper.

Is it better to leave my LaserWriter on all the time or to turn it off?

DISCUSSION -----

Generally speaking, any circuit will last longer if it is not turned on and off a lot. Switching the power decreases the life of electrical components due to the stresses of heating and cooling.

In our offices we have LaserWriters powered on for months at time. Some have been on for over a year with no need for increased maintenance.

Macintosh: OK to Use SIMMs that Are Faster than Required

=====

Article Created: 15 April 1991  
Article Last Reviewed: 20 May 1992  
Article Last Updated:

TOPIC -----

Can using SIMMs faster than what a Macintosh is officially rated for cause any problems?

DISCUSSION -----

Using SIMMs that are faster than a computer's rating should not cause any problems. It's like arriving at the bus stop 10 minutes early--you'll just be there with time to spare but it won't make the bus arrive any earlier. In the same way, your data will be ready for the CPU faster, but the CPU won't read it until it's ready.

As long as your SIMMs are good quality and the proper resistors have been clipped, there should be no problem using faster speeds.

Apple Hard Disk: Changing Its Desktop Icon (5/94)

Article Created: 29 April 1991  
Article Reviewed/Updated: 18 May 1994

TOPIC -----

Where is the hard disk icon resource located? I want to go in and change it with ResEdit, but I can't seem to find it.

DISCUSSION -----

Under System 6, changing the icon on any icon required a utility like ResEdit to modify. The location of the hard drive icon depended on where the manufacturer decided to put it. For example, with La Cie drives, the icon is made available to users for changing.

For Apple drives there was a custom resource in the SCSI Setup that puts the icon in the boot blocks of the drive. Changing the hard drive icon using a resource editing utility is not recommended by Apple.

With System 7 systems, changing the drive icon is as easy as copying an icon or picture into the Clipboard, opening Get Info on the drive, clicking on the icon, and pasting the icon you have in your Clipboard. You will not be able to change the icon if the drive is shared, or locked.

Article Change History:  
18 May 1994 - Added information about System 7 and icon modifying.

Apple II: 80 Column Card Cannot Handle Some "Color" Programs

=====

Article Created: 29 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have an Apple IIe, an Enhanced 80 Column card, and an Apple Color Monitor 100. I have two games, Batman and Hunt for Red October, that do not display in color even though they are both advertised as able to run on the Apple II with double high-resolution color graphics.

DISCUSSION -----

The problem is that your software is trying to write directly to the video circuitry instead of using calls to the software. The 80 column card cannot handle these kinds of requests.

There are only two possible fixes:

- Get a different type of monitor and video card
- Call the software companies and ask if they have a software patch.

Security: Everyone

LaserWriter: "stackunderflow;OffendingCommand:exch" Error

=====

Article Created: 28 April 1991

TOPIC -----

Every time I try to print an Excel document on a LaserWriter over AppleShare I get the message:

Error: stackunderflow;OffendingCommand:exch

I can print large documents with no problems, but not these small Excel documents. My document is clear of printer codes, and the page setup is correct.

DISCUSSION -----

That error message indicates that there is a problem with the document, either just a section of the document or the whole thing. Remove different parts of the document and copy them to a new document. Then print the new document and see if it works. If it does, add another piece from the bad document and print again. Do this until printing fails.

It may also be that your application is creating defective document. Try replacing Excel.

AppleShare Server: Which Server Files Ought Be Backed Up (6/94)

=====

Article Created: 15 April 1991  
Article Reviewed/Updated: 13 June 1994

TOPIC -----

I want to do a full, unattended backup of my AppleShare server, but my backup software only lets me backup my Server Folder separately.

What files in the Server Folder, if any, need to be backed up on a continuous basis?

DISCUSSION -----

AppleShare has two important sets of configuration information. The first is the Users and Groups data file, which is stored in the Preferences Folder of the system folder.

The second is folder permission information. On read and write volumes, this information is in an invisible file at the top level of the volume called "AppleShare PDS." On read only volumes, the information is stored inside "System Folder:Preferences:File Server." There is a PDF file for every volume that has been mounted while AppleShare was on.

You should back up both the Users and Groups data file, and the File Sharing folder as well.

TOPIC -----

By not using the Installer program to install a Macintosh System on a hard disk, what potential problems might I run into?

Also, is there any way to tell if a Macintosh System was installed correctly or drag-copied?

DISCUSSION -----

When a System is drag-copied onto a disk rather than installed using the Installer, the System becomes unstable. There are several symptoms:

- The System bombs often.
- The System hangs without error messages.
- Applications unexpectedly quit.

There is no way to tell which Systems have been installed using the Installer and which have not. The best thing to do is to remove a suspect System Folder and reinstall using the Installer application.

Ethernet Card: Determining a Card's Address (5/96)

=====

Article Created: 15 April 1991  
Article Reviewed/Updated: 6 May 1996

TOPIC -----

How can I determine the address of an Ethernet card? Is there a software utility that does this?

DISCUSSION -----

Printed on Board

-----

The network address of some Ethernet card is on a printed label on the back of the Ethernet circuit board.

EtherPeek

-----

You can obtain the AG Group EtherPeek network monitoring application, which includes a utility called it GetMyAddress. This will also return the address of the Ethernet card.

MacTCP

-----

Users who use MacTCP may be able to identify the Ethernet address by opening the MacTCP control panel and pressing the Option key when selecting the Ethernet Icon. For this to work you must be sure the caps lock key is NOT depressed.

Open Transport 1.1 or Later

-----

If you are using Open Transport (version 1.1 or later), you can obtain the Ethernet address by opening the AppleTalk control panel and selecting Get Info from the File menu.

Apple LAN Utility

-----

You can use the Apple LAN Utility to report the burned in address without being

connected to a network.

These articles can help you locate the software mentioned here:

- "Where To Find Apple Software Updates"  
Lists online services for "free" Apple software updates.
- "Obtaining Apple Product Support in the USA"

Disk First Aid: "Disk with Bad Name" Error Message

=====

Article Created: 18 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I'm running Disk First Aid on a hard drive and am getting a "Disk with Bad Name" error. What does it mean? I'm sure the hard drive is okay.

DISCUSSION -----

More than likely Disk First Aid has found a bad bit of data in the boot blocks of the hard drive--possibly a bad pointer. Disk First Aid's error messages are sometimes a little unclear because it defaults to the "closest" error message.

One thing to do is bring up Disk First Aid's status screen before you run the test. After opening the drive, type Command-S, then check the drive. You'll see a much more comprehensive list of actions than "Checking the drive...".

Also, be sure you're running Disk First Aid under Finder (not MultiFinder), and that the drive you're checking is not the startup volume.

## LaserWriter: Font Substitution Printing Problem

Revised: 6/28/91  
Security: Everyone

LaserWriter: Font Substitution Printing Problem

=====

Article Created: 29 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have suddenly begun experiencing printing problems on my LaserWriter. When I try to print with Adobe fonts, the system responds that it is "substituting a bit mapped version, as the printer font can't be found". The LaserWriter then prints using the Courier font.

This problem happened after I did some work on my System file. I was having a font ID conflict, so I removed all but the required fonts then reinstalled the fonts one-at-a-time.

Of course, all my printer fonts are in a Printer Folder.

DISCUSSION -----

This sounds like your PostScript fonts are not downloading. Are your fonts in the System Folder or in a folder in the System Folder? Put them at the first level of your System Folder; don't embed them in another sub-folder.

Also, be sure font substitution is off in your Page Setup dialog box.

LaserWriter IINTX: How It Allocates Disk Space

=====

Article Created: 29 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have a 40MB hard drive attached to a LaserWriter IINTX. Is it true that only 20% of the storage space is used for fonts while the other 80% is used for caching?

DISCUSSION -----

A hard disk attached to a LaserWriter IINTX gets initialized with 20% of the disk space dedicated to font storage and 80% to font caching. The LaserWriter Font Utility tells you how much space is available for additional font storage.

The "diskstatus" operator gives the number of pages currently available and the maximum number of pages available (a page being 1024 characters). The operator "userdiskpercent" returns the percentage of disk space allocated for user files.

The operator "setuserdiskpercent" allows you to set the percentage of user file space on the drive. It also removes the least-recently used cached bitmaps from the hard disk until there is enough free space available.

Apple IIGS: High Speed SCSI Card Not Recognizing Hard Drive

=====

Article Created: 28 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I'm using a High Speed SCSI card on my Apple IIGS. The problem is my CMS 60MB hard drive isn't being recognized by the SCSI card.

DISCUSSION -----

Check how much RAM the Apple IIGS has: to support the High Speed SCSI card, an Apple IIGS must have a minimum of 768K.

Also, check DIP switch 8 on the CMS drive. It controls the reset line, which is pin 40. All Apple SCSI cards use the reset line for handshaking. If this pin is disconnected or turned off, the Apple IIGS won't recognize the hard drive. Be sure that switch 8 on the CMS hard drive is in the closed position.

If switch 8 is in the closed position and you still do not get recognition of the hard drive, check the SCSI switch to make sure it is not set to 7.

HyperCard: Dial Command Problems with Macintosh Portable Modem

=====

Article Created: 15 April 1991  
Article Last Reviewed: 28 July 1992  
Article Last Updated:

TOPIC -----

I'm having problems using the Apple Internal 2400 baud modem with the Macintosh portable. The HyperCard Phone stack's dial command just doesn't seem to work with this modem.

DISCUSSION -----

Make sure that the 10-second pause is in the "doDial" handler. Before "put empty", the last line of code in the handler, insert these lines:

```
wait 10 sec  
send return to HyperCard
```

This way the change takes place only once, and it's easier to follow the code at that point. The "return" causes the modem to drop the line, leaving you in voice mode.

The problem with the modem and the Phone stack is that HyperCard opens the serial port for three seconds. It takes the modem around two seconds to go off hook. The dial string contains a comma creating a one-second pause. This leaves hardly any time to send the phone number. The phone number is incompletely transmitted and you get disconnected.

We suggest you use the Serial XCMDs available from APDA for sending data to modems. This command set gives you complete control over the serial port, eliminating the need for the 10-second pause to get the modem to release. (You'll need to recreate the doDial handler to use the serial XCMDs.)

Macintosh: Proper SCSI Termination for Powered-Off Devices

=====

Article Created: 29 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I'm using a Montage FR1 slide maker connected via the Macintosh SCSI port. My Macintosh won't boot if the FR1 is off. I don't want to leave the slide maker on all the time. What can I do?

DISCUSSION -----

The SCSI bus requires termination power to provide clean, quality SCSI signals. When a SCSI device has its own termination power, the SCSI bus signals are corrupted when the device is off because this leaves the SCSI bus unterminated. An non-terminated SCSI bus can cause startup problems because of noise on the bus.

Sometimes, a SCSI device supplying its own termination power can remain off at startup because it has a relatively clean SCSI bus signal. But there is no guarantee that the bus signals will stay clean and uncorrupted, as it is improperly terminated in this situation.

SCSI devices that use Macintosh termination power can be off and still be properly terminated.

Macintosh: Parity Checking Not Needed By Average Users

=====

Article Created: 28 April 1991  
Article Last Reviewed: 17 June 1992  
Article Last Updated: 17 June 1992

TOPIC -----

What is the difference between a plain Macintosh IIci and a Macintosh IIci with parity?

DISCUSSION -----

The only difference is that one machine has parity checking and the other does not. RAM parity detects single-bit errors in RAM and prevents operation with damaged data or instructions. This type of error checking detects "soft errors" and intermittent "hard errors". Most soft errors are caused by atmospheric conditions, but the reliability of current DRAM is high enough that these conditions are VERY rare. Bad RAM chips are almost always found during Macintosh startup without using parity checking.

Apple has never used ECC (Error Correction Code) schemes to detect errors in System RAM. The Macintosh IIci and Macintosh IIfx (parity models) are the first Macintosh computers to use any kind of memory error checking during normal operation.

Apple implemented parity checking as an option for the Macintosh IIci and Macintosh IIfx as a result of government requirements. Average users won't need parity checking.

For more information, search under "Parity Checking".

## Apple II: LocalTalk ImageWriter Delay from BASIC (2/97)

Revised: 2/18/97  
Security: Everyone

Apple II: LocalTalk ImageWriter Delay from BASIC (2/97)

=====

Article Created: 24 June 1991  
Article Reviewed/Updated: 17 February 1997

TOPIC -----

I'm running an Apple IIGS lab (28 systems) with seven LocalTalk ImageWriters.

When using Applesoft BASIC, my computers print properly with a "PR#1" command. However, there is a 30-second delay from the time one computer finishes printing until the next system is allowed to print.

Here is a test program that I'm using:

```
10 PRINT CHR$(4);"PR#1"  
20 FOR I=32 TO 126  
30 PRINT CHR$(I);  
40 NEXT:PRINT  
50 PRINT CHR$(4);"PR#0"
```

If I run the above test program simultaneously on two Apple IIGS computers trying to print to one LocalTalk ImageWriter, the first computer to type "run" prints fine. The other computer has to wait for the LocalTalk option board to release the printer.

I have gone through the ImageWriter technical book and can't find anything that allows the LocalTalk card to release the printer immediately after the "PR#0" command.

Is there a reset or release command that I can add to the program to eliminate this wait?

DISCUSSION -----

You are experiencing the time it takes the ImageWriter to release after the connection to the computer is lost. Your problem is that the "PR#0" command just

changes the mode of the computer; the printer still thinks the first computer should be there.

The printer has a built-in timeout that can't be changed. Something you might try is to insert an "ESC c" as line 45. This command resets the printer and might cause the printer to drop its connection before the computer does.

## LaserWriter IINTX: ROM Upgrade Supports Dynamic Soft-Switching

Revised: 6/24/91  
Security: Everyone

LaserWriter IINTX: ROM Upgrade Supports Dynamic Soft-Switching

=====

Article Created: 18 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I understand that the new LaserWriter IINTX ROM upgrade supports software switching between emulation modes and ports. Does this mean that a LaserWriter IINTX can connect simultaneously to a LocalTalk and PS/2 serial port? While the product update sheet makes this sound possible, the LaserWriter manual (Appendix F, page 133) seems to say that you must disconnect the LocalTalk connector when using the serial port.

DISCUSSION -----

Yes, this will work. The LaserWriter should ignore the "other" port, and only listen to the active port. The soft-switching capability enable/disable the ports correctly, as will the DIP switches.

To our knowledge, there isn't any software on the market that automatically takes advantage of this feature. If you want to take advantage of this feature, you'll have to write the PostScript code (there are examples of such code in the LaserWriter Owner's Guide).

There is a consideration: The LaserWriter needs to receive the code to change modes from the system connected to the active port. This means that both an MS-DOS machine and a Macintosh need to have the code, and each will tell the LaserWriter to listen to the other computer.

All in all, a much better solution is to use a single interface for all machines. LocalTalk is your best solution, with a LocalTalk interface card installed in the MS-DOS system.

## **LaserWriter: Maximum Printable Area is 6.75 x 13.0 Inches**

Revised: 6/28/91  
Security: Everyone

LaserWriter: Maximum Printable Area is 6.75 x 13.0 Inches

=====

Article Created: 28 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Why can't I print anything larger than 8.5 x 14 inches on my LaserWriter?

DISCUSSION -----

The maximum printable area of a LaserWriter is 6.75 x 13.0 inches when centered on an 8.5 x 14 inch page.

The LaserWriter II engine has a minimum left, right, top, and bottom margin of 0.197 inches. This gives the LaserWriter II a printable area of 8.106 x 13.606 inches. So, the only way to get a larger print area is to use a LaserWriter II series printer.

TOPIC -----

I'm using GateKeeper Aid with AppleShare. When I start the server, I get the message, "GateKeeper Aid encountered FCB expansion".

Is this serious? What is FCB expansion?

DISCUSSION -----

You have nothing to worry about. When you boot AppleShare, it makes major changes in the way the system is configured and GateKeeper notices the changes.

The FCB expansion is the File Control Block. This tells the system how many files can be open at one time.

Macintosh: Application Troubleshooting

=====

Article Created: 28 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I using Microsoft Works on a Macintosh with an Apple external hard drive. Whenever I try to save or quit, the hard drive runs a little with the watch on the screen, then the screen goes blank and the computer hangs. The only way to quit is to turn the Macintosh off and then on again.

DISCUSSION -----

This sounds like a software problem. Here are some basic steps you should take:

- 1) Check to be sure your System software version is compatible with the version of the application that you are running. If not, replace your application with a more current version.
- 2) Verify that there is only one System on your hard drive.
- 3) Reinstall your System using the Installer on the System Tools disk.
- 4) Remove all INITs and CDEVs from the System Folder before rebooting.
- 5) If all this fails, replace your application.

## Macintosh Portable: External Hard Drives and Sad Mac Errors

Revised: 7/28/92  
Security: Everyone

Macintosh Portable: External Hard Drives and "Sad Mac" Errors

=====

Article Created: 18 April 1991  
Article Last Reviewed: 28 July 1992  
Article Last Updated:

TOPIC -----

Are there problems with connecting an external SCSI hard drive to the Macintosh Portable? I have a Macintosh Portable with an internal 40MB drive. When I tried to connect a 45MB external drive, the Macintosh Portable refused to boot. The "Sad Mac" icon came up with the error code: 0000000F 00000002.

The hard drive is a Jasmine Direct Drive 45 that has been with a Macintosh Plus. I checked the usual things: The external hard drive was powered up and running before I powered on the Portable. There was no System Folder on the external hard drive. The drive was terminated and had a unique SCSI ID.

Am I overlooking something? Can the Portable support an external hard drive?

DISCUSSION -----

The Macintosh Portable can access and use any external SCSI device that a Macintosh Plus can access. There may be an issue with the SCSI driver on the hard drive and compatibility with the Portable boot ROMs, but we do not have any information on this problem.

The error message you gave above is roughly equivalent to an "ID=02" -- meaning that you can't really use it seriously to diagnose the problem. It does tell you that some piece of recently-loaded software got clobbered, but it's a guess to say whether it was due to software corruption, SCSI signal problems, incompatible drivers, or all of the above.

The best thing to do when getting this kind of error message is contact

the third-party's service organization for any possible information on driver compatibility.

## Responder: Changing a Macintosh Network Name

Revised: 5/15/92  
Security: Everyone

Responder: Changing a Macintosh Network Name

=====

Article Created: 24 June 1991

### Article Change History

-----

- 05/14/92 - RETITLED
- For clarity.
- 08/25/92 - REVIEWED
- For technical accuracy.

### TOPIC -----

A customer has a Macintosh set up as a workstation on an AppleShare network. When the Responder asked them to name the computer, they did that. Now they need to change the name on that computer that the Responder recognizes. We can't get Responder to allow them to rename the drive. None of the following worked:

- deleting the Responder file and copying a new one to the system.
- deleting the Responder file and then reinstalling from the system installation disks.
- starting up from a system floppy, deleting the System, Finder, and Responder files, then reinstalling the system.

### DISCUSSION -----

There is no need to throw away any files to change the network name of a Macintosh. The procedure differs, depending on the version of System software:

- With System 6, the easiest way to rename the Macintosh is to open the Chooser and type a new name in the "User Name:" field. The new name is

not used until the Macintosh is restarted.

- With System 7, open the Sharing Setup control panel and change the "Macintosh Name:" field. The new name is used immediately.

With both System 6 and System 7, the name is stored in the System file in an STR resource with an ID of -16096. When starting up under System 6, if the Macintosh has no name, the Responder will ask the user to type in a name. If a name is typed in, the Responder will write the name to the resource STR ID = -16096. System 7 does not do this. The only way to name the Macintosh is via the Sharing Setup Control Panel.

## ImageWriter II: Troubleshooting Printer is not responding

Revised: 7/29/92  
Security: Everyone

ImageWriter II: Troubleshooting "Printer is not responding"

=====

Article Created: 18 April 1991  
Article Last Reviewed: 29 July 1992  
Article Last Updated:

TOPIC -----

I'm using an ImageWriter II with a Macintosh Portable. I keep getting the message. "Printer is not responding. Check the select switch", but my select switch is on.

DISCUSSION -----

If there is nothing wrong with your ImageWriter II, there are three possible causes for this problem:

- A defective printer cable.
- A defective printer port on the Macintosh Portable.
- Incorrectly set software.

The most common of the three causes is incorrectly set software. Be sure you have selected the proper ImageWriter driver--not the AppleTalk ImageWriter--in the Chooser, and confirm that it is in the selected port, either printer or modem.

PrintMonitor: Why=6 and Why=-120 Error Messages

=====

Article Created: 18 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

My PrintMonitor is giving me the error codes of Why=6 and Why=-120. What do these mean?

DISCUSSION -----

PrintMonitor error messages can actually be decoded if you have a list of Macintosh system errors. The "why" (or y=) portion is the system error number.

Why=-120 means "Directory Not Found". Why=-120 may be the result of a corrupt directory structure on your local hard drive. Rebuilding the Desktop may solve the problem, or you may have to backup, reformat, or restore the drive.

Why=6 means "overflow trap error" and is pretty general and not much to go on. With Why=6 it's more important to know what else was going on that may have caused a conflict (such as what applications are running and what INITs and cDEVs are on the system). You may be seeing an incompatibility, memory conflict, or just general system corruption. Trashing and reinstalling the System with the Installer usually takes care of this.

MouseText: Display for Characters "F" and "G"

=====

Article Created: 29 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

What should the MouseText ROM display for characters "F" and "G"?

DISCUSSION -----

The "F" in MouseText is the character used to represent a carriage return, sort of like this:

```
  |  
  |  
<----|
```

The "G" displays four horizontal bars, an Apple II representation of an active (or foremost) window. It looks like this:

```
_____  
_____  
_____  
_____
```

(this space is intentional)

You'll find a list of MouseText characters in the Apple IIe Owner's Manual (platinum), page 133.

Macintosh SE: Third-Party 80ns SIMMs Can Cause Problems

=====  
Article Created: 29 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I'm putting a 2MB RAM upgrade into my Macintosh SE. I started out with four 120ns 256K SIMMs. I'm putting two 80ns 1MB SIMMs into slots one and two and am putting the other two 120ns 256K SIMMs into slots three and four.

At power-on, my screen shows vertical lines spaced evenly across, about 1/4 inch apart. These lines appear right away, even while showing the "happy Mac" icon. With the lines visible, I can choose "About the Finder" and it indicates that the Macintosh SE is recognizing all 2.5MB of RAM.

Should I not be mixing 80ns and 120ns SIMMs with a standard Macintosh SE?

DISCUSSION -----

We have had reports of third-party 80ns memory having strange effects on Macintosh SE computers. In all of the cases, the problem was defective memory modules. The first thing to do is replace the 80ns SIMMs with new ones. If the problem still continues, try using slower 1MB SIMMs.

Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Why is there a 1/2 inch unused border around the edge of Macintosh monitors? Why doesn't the Macintosh use its entire available screen space?

DISCUSSION -----

This is because of image resolution quality and aspect ratio concerns. The Macintosh screen has to have certain dimensions. If the projected image were to completely fill the screen, it would be slightly distorted, especially at the edge of the screen. Most computer CRTs have a mask around the border area to provide the largest and clearest usable area.

Macintosh SE/30: Screen Bowing Problems

=====

Article Created: 29 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

My Macintosh SE/30's screen bows on the sides when there is a black rectangle displaying. This happens, for example, in Excel when I select three or more cells and highlight a whole row across the entire screen. When I deselect, the bowing stops.

I've replaced the analog board, the power supply, the video board, the CRT, and disconnected the hard drive--all to no avail. Is it possible that the system board is receiving interference from something else in the system?

DISCUSSION -----

The problem you're describing is usually caused by one of three things:

- defective analog board,
- defective video board, or
- internal contrast setting set too high.

Even though you've already replaced these components, we suggest you recheck them (particularly the video board) for possible defects.

Though the logic board is a possible cause for this type of problem (since it maintains the video image in VRAM) it is unlikely to be causing the problem. If the first set doesn't solve the problem, however, then go ahead and replace the logic board.

EMI: What You Can Do To Prevent Screen Interference

=====

Article Created: 15 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I'm getting screen interference on my computer from a transformer outside my home. I've tried all sorts of surge suppressors, all to no avail. Any other suggestions?

DISCUSSION -----

Is your interference coming directly from power lines or from electromagnetic interference (EMI) in the air? If it's from power lines, you'll need a "high-end power filter" costing around \$200 and up.

Your problem sounds like general electromagnetic interference. The only thing you can do is move your monitor as far away as possible from the source of interference. You can also try putting some shielding around the monitor to protect it from EMI.

## System 7 Chooser: Device, Name, Zone, Memory Limits

Revised: 6/25/91  
Security: Everyone

System 7 Chooser: Device, Name, Zone, Memory Limits

=====

Article Created: 24 June 1991  
Article Last Reviewed: 28 July 1992  
Article Last Updated: 28 July 1992

TOPIC -----

This article discusses device, name, and zone limits as displayed and controlled through the System 7 Chooser, with some additional notes on the limits of previous versions of the Chooser.

DISCUSSION -----

The following information pertains mostly to the System 7 Chooser (use at least version 7.0 of the Chooser, preferably 7.1 or greater), with some comparative information on the System 6 Chooser:

The Chooser DA window consists of four separate sections:

- 1) The device type list.
  - 2) The AppleTalk zone list (visible only if there are multiple zones).
  - 3) The AppleTalk active/inactive controls.
  - 4) The available devices name list.
- 
- 1) The Chooser is able to display a maximum of 32 items in the Chooser device type list (Note: The System 6 limit was 16). This is the limit that is imposed by the Chooser itself, not by something interfering with the operation of the Chooser. If, for instance, you have more than 16 Chooser items in your System Folder under System 6 and only 16 show up, there is no conflict. Sixteen is simply the limit under System 6.
  - 2) The Chooser allocates memory for the zone list dynamically, up to 32K (Note: this is the same as the System 6 Chooser). Each entry in the zone list uses 1 byte of memory for each character in the zone name, plus 1 byte. The Chooser uses this extra byte as a length byte. For example,

the 7-character zone name "My Zone" uses 8 bytes of memory: 7 bytes for the characters and 1 byte for the length byte. The maximum length of a zone name is 32 characters. A 32-character zone name uses 33 bytes of memory.

Based on this information, if every zone had a 32-character name, it would be possible to have a maximum of 992 zones listed in the Chooser ( $32,768 / 33 = 992.97$ , remove the remainder). The maximum number of zones that can be displayed in the Chooser is wholly dependent on the length of the zone names being used.

3) This one is self-explanatory; it controls whether or not AppleTalk is active (Note: this is the same as the System 6 Chooser).

4) Determining the maximum number of visible Chooser device names:

The System 7 Chooser allocate a 32,768-byte buffer for the Chooser's list of available AppleTalk network device names (Note: the System 6 Chooser allocated a 512-byte buffer). Each name in the buffer is embedded in an AppleTalk Name Binding Protocol (NBP) packet received by the Chooser from the selected device type. The NBP packet is called a "lookup reply", and is sent in answer to the Chooser's lookup broadcast for the selected device. An example is the selection of the device type LaserWriter driver, and the displayed LaserWriter object names.

The buffer space used by each returned AppleTalk device is the length of the NBP reply packet returned by the device to the Chooser's lookup.

#### NBP LaserWriter Lookup Reply Packet Definition

Zone:                       1 byte for zone "*" the NBP reply default
-----
TOTAL                        22 bytes + length of the LaserWriter name
```

A calculation for determining the maximum number of visible LaserWriters in a zone:

Number of visible LaserWriters =  $\text{trunc}(32,768 / (22 + (\text{sum of name lengths} / \text{Number of LaserWriters})))$

If the LaserWriter names are all the same length, the calculation is simplified to  $\text{trunc}(32,768 / (22 + \text{length}))$ . The mean calculation (sum of

name lengths / Number of LaserWriters) is not necessary in this case.

(NOTE: Trunc indicates that decimal values should be ignored. That is, a result of 780.19 indicates 780 LaserWriters.)

The calculation can be used for any other type of AppleTalk device, if the type length and the mean of the device names are known.

System 7 Chooser selecting the Apple LaserWriter driver displays:

| Mean Name Length | Max Number of Visible LaserWriters |
|------------------|------------------------------------|
| -----            | -----                              |
| 32               | 606                                |
| 30               | 630                                |
| 25               | 697                                |
| 20               | 780                                |
| 15               | 885                                |
| 10               | 1024                               |
| 5                | 1213                               |

## System 7: System 7.0-7.1.2 Preferences Defaults & Location 8/95

Revised: 8/28/95  
Security: Everyone

System 7: System 7.0-7.1.2 Preferences Defaults & Location 8/95

Article Created: 24 June 1991  
Article Reviewed/Updated: 28 August 1995

TOPIC -----

This article describes the default preference settings of System 7.0 through System 7.1.2.

You can customize your Macintosh in a variety of ways to suit your own personal style. For example, you can change ways in which information is displayed, the sounds your system makes, and how it handles file management. Your Macintosh uses a variety of Preferences files to maintain your custom settings.

There are several preference settings under System 7. System-wide preferences, such as mouse-tracking speed, are set via Control Panels, but are stored in Parameter RAM (PRAM). Preferences specific to the Finder are also set via Control Panels, but are stored in a file called Finder Preferences located in the Preferences folder, in the System Folder.

Here is some information on where each preference is stored, along with instructions for resetting both system-wide and Finder preferences.

DISCUSSION -----

System Preferences  
=====

This table lists system-wide preferences that may affect all applications:

NOTE: Items marked with an asterisk (\*) (the last items in the table) apply to the PowerBook.

Begin\_Table

| PREFERENCE | LOCATION | DEFAULT |
|------------|----------|---------|
|------------|----------|---------|

|                                                 |                                    |                                                                                                                       |
|-------------------------------------------------|------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| 32-bit addressing                               | Memory Control Panel               | 24-bit addressing                                                                                                     |
| Disk cache size                                 | Memory Control Panel               | 6K                                                                                                                    |
| Brightness settings                             | Brightness Control Panel           | Mid-range on the slider                                                                                               |
| Highlight color                                 | Color Control Panel                | Black                                                                                                                 |

| Beep sound                                      | Sound Control Panel                | Simple beep, though it is not highlighted                                                                             |
| Startup disk choice                             | Startup Disk Control Panel         | None set, uses standard volume search method                                                                          |
| Cache settings (68040 Macintosh)                | Cache Switch Control Panel         | Faster (Caches Enabled)                                                                                               |
| Minutes before system sleep*                    | PowerBook Control Panel            | 8 Minutes                                                                                                             |
| Minutes before hard disk sleep*                 | PowerBook Control Panel            | 4 Minutes                                                                                                             |
| Macintosh PowerBook rest*                       | PowerBook Control Panel            | Rest (While in the PowerBook Portable Control Panel, hold down the Option key and click Minutes Before System Sleep.) |
| Stay awake when plugged in*                     | PowerBook Control Panel            | Unselected                                                                                                            |

|                 |                               |                                                             |
|-----------------|-------------------------------|-------------------------------------------------------------|
| Modem selection | PowerBook Setup Control Panel | Internal modem                                              |
| Wake on ring    | PowerBook Setup Control Panel | Unselected (See Portable Control Panel for internal modem.) |

Except for Date and Time and the default application font all system-wide preferences may be reset by zapping PRAM.

- To zap PRAM under System 7, hold down the Command-Option-p-r keys during start up (Make sure the Caps Lock key is up!). The Macintosh restarts shortly after displaying the "Welcome to Macintosh" screen, which indicates that PRAM has been reset.

#### Finder Preferences =====

| PREFERENCE                            | LOCATION                                 | DEFAULT                                                                                                                                 |
|---------------------------------------|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Font used for<br>Finder view          | Views Control Panel                      | Geneva 9                                                                                                                                |
| Icon alignment<br>settings for Finder | Views Control Panel                      | Straight grid - "Always<br>snap to grid" deselected                                                                                     |
| Icon list view<br>settings for Finder | Views Control Panel                      | Smallest icon; display<br>sizes, kinds, labels,<br>and dates; deselect<br>"Calculate Folder Sizes"<br>and "Show Disk Info in<br>Header" |
| Trash Can warning<br>dialog           | Setting in Get Info<br>for the Trash Can | Warn before emptying                                                                                                                    |

End\_Table

With the exception of virtual memory, these parameters may be reset by deleting the Finder Preferences file, which is located in the Preferences folder inside the System Folder. System 7 does not allow this file to be modified so if it is on the start-up disk, you need to disable it instead. To do this, drag the Finder Preferences file out of the Preferences folder and restart the Macintosh. System 7 creates a new Finder Preferences with default values automatically. You may then delete the old Finder Preferences file.

NOTE: The Virtual Memory, File Sharing, and Window Color settings are stored with their respective Control Panel files and cannot be reset using these methods. Virtual Memory and File Sharing can be temporarily disabled, however, by pressing the Shift Key while starting the Macintosh. Hold the key down until "Extensions Of" appears in the "Welcome to Macintosh" screen.

## AppleCD SC Plus: Product Description (Discontinued)

Revised: 6/1/94  
Security: Everyone

AppleCD SC Plus: Product Description (Discontinued)

=====

Article Created: 21 June 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

This article describes the AppleCD SC® Plus disc drive.

DISCUSSION -----

The AppleCD SC Plus is a CD-ROM (compact disc, read-only memory) drive that can be used with either a Macintosh or Apple II computer. It provides access to text, graphics, and sound that has been digitally recorded on CD-ROM discs. A single CD-ROM can hold approximately 650MB of information.

Speed has been improved by approximately 20% over previous models. Data from these compact discs can be copied and pasted for use in other applications. This drive supports the Apple II, Macintosh, and industry standard High Sierra and ISO 9660 file systems.

This unit has a 64K RAM buffer and a front-loading CD-ROM slot. Its CD caddy provides dust protection, guarding the integrity of the recorded information and provides a convenient way to store discs.

A CD audio chip set and the drive's CD Remote desk accessory provide for listening to audio information stored on disc. The unit includes two RCA jacks for connection to external amplified speakers as well as a headphone jack for listening to stereophonic audio information. Discs can be played using either the Apple II or Macintosh, providing the information has been pressed in an industry standard file format.

### System Requirements

-----

This drive has a universal power supply to ensure compatibility with worldwide electrical standards. Only SCSI cabling is required to use the

unit. An Apple II SCSI interface card is needed to connect the Apple CD SC Plus to an Apple IIe or Apple IIGS computer.

Ordering Information

-----

| Product Name                          | Order Number |

## AppleCD SC Plus: Specifications (Discontinued)

Revised: 10/7/93  
Security: Everyone

AppleCD SC Plus: Specifications (Discontinued)

Article Created: 21 June 1991

TOPIC -----

This article gives the technical specifications for the AppleCD SC® Plus CD-ROM drive.

DISCUSSION -----

The playback medium for the AppleCD SC Plus is a 12-centimeter optical disc installed in a CD caddy. Any CD-ROM or audio compact disc is compatible.

The data capacity in mode #1 is 656MB, 748MB in mode #2. The unit access is from 1 recording surface. The unit has a capacity of more than 270,000 blocks per disc. Data per block is 2,048 bytes in mode #1, 2,336 bytes in mode #2.

Audio playback time is more than 1 hour with a frequency response of 20 to 20,000 hertz.

Characteristics include

- Typical access time is 380ms (including latency).  
The maximum first to last block access time is typically 650ms.
- The data streaming rate is 150K/second in mode #1, 171K/second in mode #2.
- The block rate is 75 blocks/second.
- SCSI bus transfer burst rate is 1.5MB/second.
- Rotational speed is approximately 230 to 530 rpm (variable).
- Startup time is typically 5 seconds, but media-dependent.
- Spin-down time is typically 2 seconds.

Electrical requirements

- 100 to 240 volts AC for line voltage
- Frequency is 50 to 60 hertz with maximum power of 40 watts.

#### Environmental requirements

---

- Operating temperature: 50 to 104 degrees Fahrenheit (10 to 40 degrees Centigrade)
- Storage temperature: -22 to 122 degrees Fahrenheit (-30 to 50 degrees Centigrade)

#### Size and Weight

---

Height: 3.31 in. (8.4 cm)  
Width: 9.69 in. (24.6 cm)  
Depth: 10.47 in. (26.6 cm)  
Weight: 8.8 lb (8 kg)

## SNA•ps Gateway: Description (Discontinued)

Revised: 6/1/94  
Security: Everyone

SNA•ps Gateway: Description (Discontinued)

=====

Article Created: 21 June 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

This article describes the SNA•ps™ Gateway.

DISCUSSION -----

Overview

-----

The SNA•ps Gateway is Apple's implementation of Systems Network Architecture protocols and services. It is an integrated 3270 Advanced Program-to-Program Communications (APPC), and Advanced Peer-to-Peer Networking (APPN) gateway. You can configure it as a personal gateway for direct SNA connectivity or as an AppleTalk network gateway to enable any Macintosh to communicate with IBM systems running the VM, MVS, OS/400, and OS/2 operating systems.

The SNA•ps Gateway supports multiple expandable interface cards, tunable performance parameters, and combined 3270 and APPC configurations. It provides access to existing 3270 terminal-based applications and a Macintosh interface to host applications, databases, and OfficeVision services.

It is implemented on an intelligent NuBus card, and offers parallel sessions and independent LU support. The design frees the main Macintosh processor to run other LAN applications that provide file, mail, and database services. It is easily upgraded to support new features without hardware changes.

System Requirements

-----

To use the SNA•ps Gateway, you need:

- A Macintosh II system with a minimum of 1MB of RAM (Additional RAM on the Macintosh II logic board will not affect gateway performance.)
- System software version 6.0.5 or later
- An Apple Coax/Twinax Card, Apple TokenTalk NB Card, or Apple Serial NB Card

#### Product Details

-----  
SNA Protocols. The SNA•ps Gateway protocols are a complete implementation of IBM LU 2, LU 6.2, and NT 2.1.

AppleTalk Gateway. In AppleTalk network environments, the SNA•ps Gateway serves as a network resource for Macintosh applications such as SNA•ps 3270 or third-party SNA•ps-compatible applications.

Server Administration. These Macintosh applications, which can be run on the Macintosh containing the SNA•ps Gateway or on a Macintosh connected to the Gateway via AppleTalk, are used to initialize and manage local and remote SNA•ps Gateways:

- SNA•ps 3270 Manager allows SNA•ps Gateway configuration where only 3270 terminal emulation is needed for a single connection to a single host.
- SNA•ps Config allows SNA•ps Gateway configuration for more complex environments that may involve multiple lines, multiple hosts, and APPC connections.
- SNA•ps Admin provides a complete set of management features for SNA•ps Gateways running any configuration created by SNA•ps 3270 Manager or SNA•ps Config.

System 7: Short File and Folder Names for MS-DOS Access

Article Created: 24 June 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

The file and folder names in the Get Info dialog box are not the same as the name shown under the directories on the Finder desktop. When I click on the name in the Get Info dialog box, the name changes. Why?

DISCUSSION -----

The file or folder you're viewing is located on a file server or is being shared under System 7. To allow both MS-DOS computers and Macintosh computers to access file servers, all files and folders are named twice.

Since MS-DOS limits both the length and the kinds of characters in file and folder names, we have to change the standard Macintosh names to shorter versions that work under MS-DOS. Clicking on the file or folder name in the Get Info dialog box toggles between the Macintosh and MS-DOS versions of the name.

Examples:

|                                |                        |
|--------------------------------|------------------------|
| Macintosh name = System Folder | Short name=!System.Fol |
| Macintosh name = Cafe 7.0F     | Short name=!Cafe_7.0F  |

Security: Everyone

System 7: Microsoft File Version 2.0, 2.0a Not 32-Bit Compatible

=====

Article Created: 24 June 1991

### Article Change History

-----

09/02/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

Is Microsoft File (versions 2.0 and 2.0a) 32-bit compatible?

### DISCUSSION -----

No. It has problems running with 32-bit addressing turned on. The difficulty is in creating a new database structure from a copy of another database structure. When this occurs, the application unexpectedly quits, listing a type 1, bus error.

Macintosh 21" Color Display (International): Specs (Disc.)

=====

Article Created: 21 June 1991

TOPIC -----

This article gives the technical specifications for the Macintosh 21" Color Display.

DISCUSSION -----

Product Overview

-----

This document describes the special features of Apple's Macintosh 21" Color Display. (As of June 1991, this display is not available for sale in the United States.)

Feature Set

-----

- Two full pages of color display
- Asymmetric .26 mm horizontal by .29 mm vertical dot pitch
- 1152 horizontal pixels by 870 vertical lines
- 79 dots per inch
- Horizontal scan rate 68.7 kHz
- Vertical refresh rate 75 Hz
- Automatic degaussing
- Excellent ergonomic design
- Two ADB ports for keyboard and mouse
- Anti-glare screen
- Vertically and horizontally pivoting base
- Meets Swedish recommendation for low frequency magnetic and electric field emissions.

Video Card Support

-----

The 21" Color Display is supported by the same video cards as Apple's Two-Page Monochrome Monitor. Cards supporting the 21" Color Display include:

- Macintosh Display Card 4•8 at 4 bits per pixel
- Macintosh Display Card 8•24 at 8 bits per pixel
- Macintosh Display Card 8•24 GC at 8 bits per pixel
- SuperMac Spectrum 24/PDQ Card at 24 bits per pixel

RasterOps has also indicated that their 24-bit card will support the 21" Color Display. The 21" Color Display is not supported by on-board video on the Macintosh IIci, Macintosh IICx, or Macintosh LC.

#### Shadow Mask

-----

A metal shield or mask acts as a filter to separate the red, green, and blue electron beams that create the images you see. The Macintosh 21" Color Display uses a perforated shield called a shadow mask. This differs from some other monitors which use a vertically-oriented aperture grill design. After the electron beams pass through a mask or grill, they strike the designated red, green, or blue dots of phosphor on the back of the screen. When the beams strike the colored phosphor dots, they glow. The combination of the glowing dots produces the color images you see.

Traditional mask and grill designs use perforations arranged in a pattern that interacts with the changing pattern of the electron beams as they scan across the shield. The interaction of these patterns frequently causes a subtle screen interference, called a moire pattern. Certain Macintosh desktop patterns cause the interference to be quite obvious.

The Macintosh 21" Color Display has a unique design for the pattern of tiny holes in its shadow mask. The 21" Color Display uses an asymmetric dot pitch of .029 mm horizontally and .026 mm vertically. This pattern does not conflict with the one created by electron beams and thus avoids the distracting effects of the most common moire patterns.

#### Uniform Brightness

-----

Traditional CRT technology has limitations that cause many large-screen color monitors to show uneven brightness across the screen. Variable screen brightness degrades the image quality and increases eye fatigue.

The Macintosh 21" Color Display uses a CRT design that provides uniform brightness across the entire screen. All parts of the screen show the same vivid colors. There is no degradation between the center of the screen and the edges.

#### Adjustable White Point Color Temperature

-----

The white point color temperature is a measure, in degrees Kelvin, of how white a display's white is. Traditional displays use a 9300 degree Kelvin white which has a bluish tint to it and a high contrast. A 6500 degree Kelvin white is similar to page white and is more useful for color matching.

The Macintosh 21" Color Display features an adjustable white point color

temperature. The white point color temperature can be adjusted by selecting the monitors CDEV in the control panel and clicking on the option button. The options dialog offers a choice of gamma tables and among them are the "Mac Std Gamma" and "Page-White Gamma". The "Mac Std Gamma" is the 9300 degree Kelvin option that is the traditional bluish display white. The "Page-White Gamma" is the 6500 degree Kelvin white that closely resembles the white of a printed page.

#### Automatic Degaussing

-----

The Macintosh 21" Color Display has innovative circuitry that provides automatic degaussing, ensuring that you always have the best image possible on your screen. Color display technology uses magnetic fields to guide electron beams inside the CRT to the screen. If a foreign magnetic field comes close to the CRT, it may disturb the internal magnetic field and cause the beams to be slightly misdirected, distorting the screen image.

Most monitors have circuitry that compensates for the distortions by adjusting the internal magnetic field to counteract the external magnetic field. However, most monitors degauss only when they first start up. If the external magnetic field changes enough during operation to distort the screen image, the image remains distorted until the power is turned off and on again.

The AppleColor™ High-Resolution RGB Monitor has a manual degauss control that allows you to press a button to degauss the monitor without turning it off.

The Macintosh 21" Color Display has startup, manual, and automatic degaussing features. If the small magnetometer (a device that measures magnetic fields) inside the case senses a major change in the ambient magnetic field, it sends a signal that initiates a degauss.

Tilting or swiveling the monitor may change the magnetic field enough to cause distortion, and to trigger automatic degaussing. Automatic degaussing guarantees that the image on your screen is the best it can be. Occasional automatic degaussing is normal. The magnetometer is operational whenever the power is on so it can occur even when there is no image on the screen. If degaussing occurs when you haven't moved the monitor, there may be a source of interference in the room. It may be necessary to move the source of interference to another location to reduce the frequency of automatic degaussing.

#### Ergonomics

-----

The Macintosh 21" Color Display has several ergonomic features that provide optimum flexibility for viewing comfort and ease of use.

- An antiglare, antistatic panel greatly reduces glare and dust buildup.
- The built-in tilt and swivel base makes it easy to change your viewing angle.
- A 75 hertz screen refresh rate eliminates any flickering on your screen.

- The easily accessible ADB ports on the front of the base offer flexibility for arranging your system's components.
- Brightness and contrast controls on the front of the monitor make it easy to make adjustments.
- The curved and recessed base, the recessed video cable connector, and the right-angled power cord all help to reduce the total desk space needed for the monitor.
- The hard plastic spheres on the bottom of the base make it easier to lift and slide the monitor to a new location nearby.

#### Specifications

-----

##### Picture Tube:

- 21-inch diagonal, 20-inch viewable, with in-line gun
- 90 degree deflection angle
- Black matrix-type dot screen
- Phosphor type (aluminized), P22
- Flat square faceplate with gray filter glass, 50% nominal light transmission
- Shadow mask
- Dot pitch 0.26 x 0.29 millimeters
- Phosphor CIE coordinates: red, green, blue
- Color Temperature 6500 degrees K

##### Input Signals:

- Red, green, and blue video signals; TTL separate sync

##### User Controls:

- On/off switch (back, above power cord)
- Brightness, with detent reference (front, right)
- Contrast (front, left of brightness control)
- Manual degauss switch (back, above security lock)

##### Scanning and Refresh Rates:

- Horizontal scan rate 68.7 kHz
- Vertical refresh rate 75 Hz

##### Video Rise and Fall Time:

- 5 nanoseconds maximum

##### Active Video Image Area:

- Adjusted at the factory to produce an active video area described by an ideal rectangle of 371 mm by 280 mm. The remainder of the screen is used for the dark border around the screen.

##### Resolution:

- 1152 horizontal pixels by 870 vertical lines; 79 dots per inch

##### Dimensions:

- Weight 79.6 lb. (36.2 kg)
- Height 46.1 cm

##### Electrical Input Requirements:

- Voltage 85-135 volts (AC) or 170-270 volts (AC)
- Frequency 47-63 Hz
- Power 165 watts maximum, all line conditions

Operating Ambient Temperature:

- 50-95 degrees F (10-35 degrees C)

Environmental Requirements:

- Operating Humidity 95% maximum, noncondensing
- Operating Altitude 10,000 feet maximum

Fuse Protection:

- The monitor contains internal power line fuse protection. Its fuse should be replaced with a fuse of the same type by a qualified service technician.

Warm-up Time:

- 30 minutes to meet all specifications (however, the monitor can be used immediately after it's turned on)

Video Input signal jack pin assignments:

| Pin   | Function     |
|-------|--------------|
| ---   | -----        |
| A1    | Blue video   |
| A2    | Green video  |
| A3    | Red video    |
| 1     | Hsync return |
| 2     | Vsync        |
| 3     | Sense #3     |
| 4     | Sense ground |
| 5     | Csync        |
| 6     | Hsync        |
| 7     | Vsync return |
| 8     | Sense #2     |
| 9     | Sense #1     |
| 10    | Csync return |
| Shell | Shell ground |

## System 7: Contiguous Memory with Virtual Memory in 24-bit Mode

Revised: 6/28/91  
Security: Everyone

System 7: Contiguous Memory with Virtual Memory in 24-bit Mode

Article Created: 25 June 1991

### Article Change History

-----  
08/19/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

What is the largest contiguous memory block available with virtual memory in 24-bit mode?

### DISCUSSION -----

In 24-bit mode using virtual memory, total RAM can be set up to 13MB, depending on the CPU and the number and placement of NuBus cards. This memory is not a contiguous block, however. The largest contiguous block will be roughly 7.5MB.

Viewing the About this Macintosh window can appear confusing because the totals for RAM used by programs may seem to add up incorrectly. A total of 16MB of RAM is addressable under System 7. Some of this is memory reserved for ROM (1MB), IO (1MB), video for the Macintosh IIci or Macintosh IIsi (1MB), and NuBus cards (1MB each). This memory is mapped starting above the 8MB mark. Any free memory in the upper 8MB of RAM (up to the 5MB possible) forms an "upper memory block."

Under System 7, system heap first loads into the bottom 8MB of memory then programs, starting with Finder, load into the upper memory block, provided there is a large enough contiguous block there to hold the program. If there is not a large enough contiguous block in the upper memory, the program will load in the lower memory block. Thus it is possible to have a lower unused block of about 7.5MB (the lower 8MB minus

system heap) and an upper unused block of about 4MB (or less). Viewing About this Macintosh lists only the largest unused block of memory, not the total unused memory.

System 7: Ready,Set,Go! Compatibility

=====

Article Created: 25 June 1991

### Article Change History

-----

09/02/92 - CORRECTED

- Spelling of product name.

### TOPIC -----

Is Ready,Set,Go! 4.5 fully compatible with System 7?

### DISCUSSION -----

Ready,Set,Go! 4.5a, which is listed as fully compatible in the "System 7.0: Compatibility With Selected Hardware and Software" booklet has some compatibility problems with printer drivers later than 5.2 (System 7 drivers are 7.0).

Non-PostScript pen lines and fills will not print and may result in the error message "Undefined error, Command-S 8. A PostScript error has been generated by the LaserWriter extension file. The document is OK but cannot be printed." PostScript pen lines and fills which are located to the far left of the Ready,Set,Go! menu work fine.

LetraSet will not be updating Ready,Set,Go! 4.5a, but will continue to support the product. They recommend Design Studio 2.0 as an upgrade.

## TDD Modems

Revised: 7/9/91  
Security: Everyone

TDD Modems

=====

Article Created: 1 May 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

What companies manufacture modems that can communicate with deaf or hearing-impaired TDD (Telecommunication Device for the Deaf) users?

DISCUSSION -----

Krown Research and UltraTec make 300-baud/TDD modems. You can find their addresses and phone numbers in separate articles in the Tech Info library by searching on their company names.

These modems require a special cable to connect to the computer. They can be used with a Macintosh or Apple II system equipped with an RS-232 serial port. Use the 300-baud modem setting.

You can use MacTerminal 2.3.1 with these modems. MacTerminal 3.0 will not work with the TDD modems.

For a normal modem to communicate with a TDD Modem, change the TDD settings to ASCII and 300 baud, and set the normal modem to 300 baud and TTY.

Macintosh IIsi: Third-Party Monitors

=====

Article Created: 1 May 1991  
Article Last Reviewed: 17 July 1992  
Article Last Updated:

TOPIC -----

What third-party monitors are compatible with the Macintosh IIsi?

DISCUSSION -----

Most multisync monitors that are about 14" should work. There currently is no third-party two-page or portrait option available for the Macintosh IIsi's built-in video.

Here is a list of companies whose monitors work with the Macintosh IIsi's built-in video:

- Mitsubishi
- Relisys
- Seiko
- Sony
- NEC MacSync
- NEC Multisync
- Princeton

## Backup Power Supplies

Revised: 6/22/92  
Security: Everyone

Backup Power Supplies

Article Created: 31 May 1991  
Article Last Reviewed: 1 June 1992  
Article Last Updated:

TOPIC -----

This article presents some information about backup power supplies.

DISCUSSION -----

Here are a few evaluations done on standby power supplies, which will allow users, should a brownout or power failure occur, to shut down their systems without losing data.

An evaluation in the April 30, 1990, PC Week cited two products:

- SPS300, a 300 volt-ampere device from ITT Powersystems Corp.
- MM300SS, a 312 volt-ampere device from Sutton Designs

Both of these units kept the PC Week system operating for 12 minutes after a power outage.

An evaluation in the February 12, 1990 Infoworld mentioned the following products:

- 600-LS, a 600 volt-ampere device from American Power Conversion Corp.
- Linebacker 300, a 300 volt-ampere device from SL Waber, Inc.
- 650FR, a 650 volt-ampere device from Alpha Technologies, Inc.

This is a heavy-duty supply (128-pound unit needing floor space) that will keep a system working for an hour and a half after a failure.

An evaluation in the April 1989 Byte magazine discussed the following:

- VIP 800, an 800 volt-ampere device from ITT Powersystems Corp. that gave a

## ..TIL07430-Backup\_Power\_Supplies\_(TA46073).pdf

10-minute reprieve after a power failure.

- PC/ET, a 360 volt-ampere device from Emerson Electric

This is a small size power supply with 7-minute backup time.

For more information, search under the company names.

## Macintosh IIci, IIfx, IIsi, LC: Memory Manager Performance

Revised: 7/14/92  
Security: Everyone

Macintosh IIci, IIfx, IIsi, LC: Memory Manager Performance

=====

Article Created: 15 May 1991  
Article Last Reviewed: 10 July 1992  
Article Last Updated: 10 July 1992

TOPIC -----

A customer reported that a Macintosh IIfx took 12-13 minutes to load and display an Adobe PhotoShop file. A Macintosh IIfx took 1-2 minutes to load and display the same file. The customer was not using the black terminator, or the internal SCSI filter on the Macintosh IIfx. After the customer installed these, the Macintosh IIfx performed as expected.

DISCUSSION-----

There is a minor problem in the Memory Manager in the ROMs of the Macintosh IIci, IIfx, IIsi, and LC. This results in performance degradation in an extremely small number of applications, and doesn't cause system crashes. This affects few applications and very few customers. It is not a new problem and it only applies if you're using System 6, System 7.0 corrects this bug.

During extensive testing and research, Apple investigated a variety of solutions to enhance the memory manager performance. One solution was software called the Memory Manager INIT ( a software "patch"). Testing revealed that this patch did not enhance Memory Manager performance, and introduced risks, such as decreased performance, in some mainstream applications. We are aware of the distribution of an unofficial version of the Memory Manager INIT. This INIT was modified from Apple's experimental version, and should NOT be used. This INIT can cause data corruption, data loss and system crashes. Apple strongly urges that you throw away this INIT.

Because of the minimal impact, the Apple task force decided that it was not necessary to develop, test, and release a patch to the Memory Manager for System 6. It is important to realize the implications of patching the

Memory Manager. Since it is at the heart of everything the Macintosh does, any patch would require major testing resources to cover the entire product line, large numbers of applications, and Network and Communications products.

Based on developer feedback, customer feedback, and extensive in-house testing, Apple identified very few affected applications.

If you have a customer reporting slow downs on the Macintosh IIci, IIfx, IIsi, or LC, check the following items:

- 1) They aren't using built-in video. The Macintosh IIci and IIsi cycle-steal. The LC does not.
- 2) They have a clean System folder. Large numbers of INITs cause many problems.
- 3) They don't have network-based problems that also cause slow downs.
- 4) They have a properly configured SCSI bus.
- 5) They generally have a configuration that works.

If the slow performance persists after checking these items, it may be due to a Memory Manager software problem. The best solution would be to upgrade to System 7.

Macintosh: Plotter Driver Software

=====

Article Created: 30 May 1991  
Article Last Reviewed: 22 May 1992  
Article Last Updated:

TOPIC -----

Plottergeist is a Macintosh Chooser-level plotter driver that supports Hewlett-Packard and Houston Instrument plotters.

DISCUSSION -----

Plottergeist allows the connection of a Macintosh to plotters to produce plotted output from CAD software, presentation packages, drawing and graphics programs. Compatible with all Macintosh applications, the plotter can be chosen from within a software application.

Background printing allows users to work on the Macintosh while their document is being plotted. A preview mode allows users to see their entire document before sending it to be plotted.

Arbitrary reduction and enlargement allows scaling output to fit from a standard letter-size page to a 36 by 48-inch E-size drawing. You can print smooth text in large sizes, or use the plotter's built-in fonts for fast draft work.

The package includes disk, manual and an RS-232 interface cable.

Plottergeist requires a Macintosh Plus or later. Background printing requires 2MB of RAM and MultiFinder.

Plottergeist is available from Palomar Software, Inc. For more information, search on the keyword, "Palomar".

## Macintosh: Connections Software from Concentrix

Revised: 7/24/91  
Security: Everyone

Macintosh: Connections Software from Concentrix

=====  
Article Created: 30 May 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

This article describes Connections™ software for the Macintosh.

DISCUSSION -----

Connections software, from Concentrix Technology, Inc. consists of applications such as personal calendaring, to-do lists, a telephone directory, call tracker, daily accomplishments journal, and text information organizer. It provides an interface to IBM PROFS electronic mail and group calendaring.

Many of the functions of PROFS calendaring and electronic mail can be done off line, including archiving, organizing, and searching e-mail messages. If the mainframe or network goes down, the user still has access to the calendar and previously read e-mail messages. Mail messages can also be created off line and sent from Connections' out basket.

Connections offers slots for additional modules that can be created with other third-party connectivity tools, such as MitemView or SQL/DAL add-ons.

Connections can be modified in HyperCard.

The address and phone number of Concentrix Technology, Inc. are in a separate article in the Tech Info Library.

## Macintosh LC: Screen Print to an ImageWriter

Revised: 7/23/92  
Security: Everyone

Macintosh LC: Screen Print to an ImageWriter

=====

Article Created: 15 May 1991  
Article Last Reviewed: 23 July 1992  
Article Last Updated:

TOPIC -----

When using the Command-Shift-4 key sequence to print the screen, the ImageWriter defaults to the modem port. If you open the Chooser, reselect the printer port, and then close the Chooser, the ImageWriter still defaults to the modem port. Can you get a screen print on a Macintosh LC connected to an ImageWriter?

DISCUSSION -----

You can get a screen print with a Macintosh LC when you leave the Chooser window open as the top window, and print to the ImageWriter using Command-Shift-4.

A better solution is to use the Command-Shift-3 key sequence to print the screen to a disk file. Then open the disk file in MacPaint, and print from there.

## Personal LaserWriter NT: Switch Settings (11/96)

Revised: 11/8/96  
Security: Everyone

Personal LaserWriter NT: Switch Settings (11/96)

Article Created: 15 May 1991  
Article Reviewed/Updated: 8 November 1996

TOPIC -----

Users sometimes confuse the Personal LaserWriter NT switch assembly with the SCSI ID selector found on SCSI hard drives. These users change the printer mode number from zero (the default LocalTalk/PostScript setting) to another number. If the printer is set to anything other than zero or seven, the printer will disappear from the Chooser and the green ready light may begin blinking. How can users resolve this problem?

DISCUSSION -----

To resolve this problem, reset the mode selector switch to zero, then restart the printer. When the test page prints, verify that it contains the desired printer configuration information.

The Personal LaserWriter NT has two connectors (DIN-8, DB-25) and a switch assembly that looks almost identical to the SCSI ID selector switch on external SCSI drives. The switch assembly sets the printer mode (LocalTalk/PostScript, Diablo 630 Emulation, and so on) for the printer, and has nothing to do with a SCSI ID setting.

Here is the switch setting information:

| Switch | Port  | Mode Setting                                         |
|--------|-------|------------------------------------------------------|
| -----  | ----  | -----                                                |
| 0      | Din-8 | AppleTalk, PostScript (normal mode)                  |
|        | DB-25 | Serial, no input                                     |
| 1      | Din-8 | Serial (9600), (No parity), 7 data bits, 1 stop bit, |
|        |       | XON/XOFF, PostScript Batch Mode                      |
|        | DB-25 | Serial 9600, No parity, 7 data bits, 1 stop bit,     |
|        |       | XON/XOFF, PostScript Batch Mode                      |

|   |       |                                                                                            |
|---|-------|--------------------------------------------------------------------------------------------|
| 2 | Din-8 | Serial 9600, No parity, 8 data bits, 1 stop bit,<br>XON/XOFF, HP Emulation                 |
|   | DB-25 | Serial 9600, No parity, 8 data bits, 1 stop bit,<br>XON/XOFF, HP Emulation                 |
| 3 | Din-8 | Serial 9600, No parity, 8 data bits, 1 stop bit,<br>XON/XOFF, Diablo 630 Emulation         |
|   | DB-25 | Serial 9600, No parity, 8 data bits, 1 stop bit,<br>XON/XOFF, Diablo 630 Emulation         |
| 4 | Din-8 | Serial 1200, No parity, 7 data bits, 1 stop bit,<br>XON/XOFF, PostScript Batch Mode        |
|   | DB-25 | Serial 1200, No parity, 7 data bits, 1 stop bit,<br>XON/XOFF, PostScript Batch Mode        |
| 5 | Din-8 | Serial 9600, No parity, 8 data bits, 1 stop bit,<br>no handshake(?), PostScript Batch Mode |
|   | DB-25 | Serial 9600, No parity, 8 data bits, 1 stop bit,<br>DTR, PostScript Batch Mode             |
| 6 | Din-8 | Serial 9600, No parity, 8 data bits, 1 stop bit,<br>XON/XOFF, PostScript Binary Mode       |
|   | DB-25 | Serial 9600, No parity, 8 data bits, 1 stop bit,<br>XON/XOFF, PostScript Binary Mode       |
| 7 | Din-8 | AppleTalk, PostScript (normal mode)                                                        |
|   | DB-25 | no input                                                                                   |

Notes:

- For switch positions 1 through 6, the parameters are listed in the following order: data transfer rate, parity check, number of data bits, stop bits, handshake and mode.

- PostScript Binary Mode allows the user to change in and out of the various emulation modes (like Diablo 630 and HP Emulation) while still in PostScript by using control codes. This was a limiting factor on the LaserWriter IINTX, but is available on the Personal LaserWriter.

- When the switch is set to 4 and you turn on the printer, you will get a diagnostic page instead of the normal startup page. This page shows the current parameters of each switch setting and other useful information.

- To Connect the Personal LaserWriter to an MS-DOS computer with a LocalTalk PC Card installed, use setting 0 or 7 [0 is the default setting from the factory].

## Apple II High Speed SCSI Card: CMS Hard Drive (11/96)

Revised: 11/20/96  
Security: Everyone

Apple II High Speed SCSI Card: CMS Hard Drive (11/96)

=====

Article Created: 15 May 1991  
Article Reviewed/Updated: 14 November 1996

TOPIC -----

My computer does not recognize a CMS hard drive when using the Apple II High Speed SCSI card. How can I correct this problem?

DISCUSSION-----

Ensure DIP switch 8 on the CMS hard drive is in the closed position. DIP switch 8 controls the reset line at pin 40. All Apple SCSI cards use the reset line for handshaking. If this pin is disconnected or turned off, the computer will not recognize the hard drive.

If your computer still doesn't recognize the CMS hard drive, check the SCSI switch to make sure it is not set to 7.

## Apple IIGS: Remove AppleTalk Before Internal Test

Revised: 7/25/91  
Security: Everyone

Apple IIGS: Remove AppleTalk Before Internal Test

=====

Article Created: 1 May 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I performed an internal test on my Apple IIGS using the Command-Control-Option-Reset key sequence. Soon after I did this, other computers were disconnected from the network. Did my Apple IIGS internal test cause the problem?

DISCUSSION -----

Yes. When performing an internal test on an Apple IIGS that is on an AppleShare network, be sure to disconnect the network connector. Failure to do so will cause severe communication problems with other nodes, and will usually result in other computers becoming electronically disconnected from the network.

## Macintosh IIfx: StarController Incompatibility, Workaround

Revised: 7/25/91  
Security: Everyone

Macintosh IIfx: StarController Incompatibility, Workaround

=====

Article Created: 31 May 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

This article describes workarounds for the StarController compatibility problem with the Macintosh IIfx.

DISCUSSION -----

The Macintosh IIfx, with it's new high speed serial ports, has some problems with the "Black Beauty" StarController™ hub (PN207). If you set the serial ports on the Macintosh IIfx to "Compatible Mode" everything works fine. But in "High Speed Mode," network performance actually drops if you are going through a StarController.

The problem involves the StarController timing PAL (a socketed programmable analog logic chip) and the way AppleTalk is implemented on the Macintosh IIfx. By replacing the PAL with a GAL (gate array logic chip), you can restore StarController and Macintosh IIfx communication.

The StarController Series 300 hub, which replaces Black Beauty, works fine with the Macintosh IIfx in "High Speed Mode." If you have a Black Beauty StarController and want the PALs replaced by GALs, you can get an upgrade kit, available to the general public (U.S. ONLY).

The address and phone number for Farallon is in a separate article in the Tech Info Library.

## Macintosh IIfx: Logic Board Jumper Settings

Revised: 7/15/92  
Security: Everyone

Macintosh IIfx: Logic Board Jumper Settings

Article Created: 1 May 1991  
Article Last Reviewed: 14 July 1992  
Article Last Updated:

TOPIC -----

A customer's Macintosh IIfx is not functioning, and I suspect that the jumper settings on the logic board have been altered. What should I check for?

DISCUSSION -----

Jumper J103 on the Macintosh IIfx logic board disables the external 68030 RAM cache when it is disconnected. In the event that the jumper is removed, the system may not reset properly when turned on, essentially disabling the system.

As a side note, the jumper next to J103, J106, is used for debugging. This jumper is not documented because it can severely affect system performance.

## Data Modem 2400: Reset Parameters Before Testing

Revised: 7/25/91  
Security: Everyone

Data Modem 2400: Reset Parameters Before Testing

=====

Article Created: 1 May 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

My customer is unable to establish communications with a dial-up service or another modem. The modem dials out, but as soon as the connection with the other modem is made, it hangs up. The Apple ModemTest diagnostic confirms a failure in the modem board. Since replacing the main board doesn't solve the problem, what should I do next?

DISCUSSION -----

The Data Modem 2400 has many parameters that are configured through software. Some of the finished goods units, and some of the service stock boards, may not be configured for normal use. The current ModemTest diagnostic test will fail any modem that has parameters other than the default settings.

Reset the modem parameters to the default settings. Do this by pressing the switch on the front of the modem while turning it on, or by issuing the 'AT&F' command using a terminal emulation package. The reset procedures are documented in the owner's guide.

### TOPIC -----

This article describes an intelligent electronic switching device, called BridgePort. Extended Systems manufactures this product.

### DISCUSSION -----

BridgePort extends the use of a PostScript printer to both PCs and Macintosh systems. It automatically directs print jobs from connected PCs and Macintosh systems to a single PostScript printer. BridgePort allows two PCs and up to 31 Macintosh systems to print.

Macintoshes connect to BridgePort with standard LocalTalk or PhoneNet cabling. PCs connect to BridgePort with a serial or parallel (Centronics) cable.

Here are the steps required to set up BridgePort:

- 1) Connect the required cabling.
- 2) Initialize the printer.
- 3) Select the appropriate PostScript printer driver.

BridgePort requires no special printer drivers. For Macintosh, select LaserWriter in the Chooser. For PCs, configure the application software to use a PostScript printer.

BridgePort supports the HP LaserJet series II, IID, IIP, and III printers with an Adobe or HP PostScript cartridge or Pacific Data Products PostScript emulation cartridge. It also supports the Apple LaserWriter IINT and IINTX, the IBM LaserPrinter with PostScript option, and the QMS-PS 810 turbo.

The phone number and address for Extended Systems is in a separate article in the Tech Info Library.

## Macintosh Portable: Battery Recharger

Revised: 6/20/94  
Security: Everyone

Macintosh Portable: Battery Recharger

Article Created: 31 May 1991  
Article Reviewed/Updated: 30 July 1992

TOPIC -----

This article describes battery rechargers for the Macintosh Portable.

DISCUSSION -----

Apple Computer sells the Macintosh Portable Battery Recharger (p/n M0275). It comes with a power adapter and a cradle that holds the battery while it is recharging.

Lind Electronic Design, Inc. (LED) markets a specially designed External Battery Charger for the Macintosh Portable Rechargeable Battery. It comes in a molded plastic box with carrying handle. It measures 3.3 x 6 x 7 inches, weighs 1.6 lbs. without the spare battery, and obtains power through Apple's Power Adapter from a 115V AC wall outlet. It can also charge the battery from a 12V DC power source such as a vehicle cigarette lighter.

LED also sells a 12V DC Automobile Power Adapter that plugs into the Macintosh Portable through the Power Adapter port. The Automobile Power Adapter can operate the computer and charge its internal battery from a 12V DC power source. A regulator prevents the Power Adapter from overcharging the Macintosh Portable's internal battery. It weighs only 0.75 lbs, measures 1.9 x 2.4 x 3.3 inches, and comes equipped with a Velcro fastener strip to attach it to the side of the Macintosh Portable's case. When the Adapter is not in use, all power cords and plugs fit into the Portable case.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

Article Created: 1 May 1991

### Article Change History

-----

08/21/92 - EDITED  
• For clarity and technical accuracy.

### TOPIC -----

What is Responder?

### DISCUSSION -----

Responder is a resource placed in individual Macintoshes that identifies that computer - and any others in the network that have Responder installed - when the Inter•Poll program runs. At startup time, Responder reads the name of the user and the Macintosh name where it resides, then the versions of the system software, LaserWriter driver, and AppleTalk. Inter•Poll requests this information later to tell the system administrator the characteristics of the user's system. Inter•Poll interrogates each system, and Responder answers Inter•Poll.

Macintosh II Family: NuBus Video Port Expanders

=====

Article Created: 31 May 1991  
Article Last Reviewed: 9 June 1992  
Article Last Updated:

TOPIC -----

This article describes NuBus video port expanders for the Macintosh II family, manufactured by Network Technologies, Inc.

DISCUSSION -----

Vopex-2M

-----

The Vopex-2M video port expander allows two Macintosh II monitors to be driven from the same video port. In addition, the operating distance between the Macintosh and its monitors can be extended to 50 feet. This permits the relocation of monitors into classrooms, control rooms, factory floors and applications using video projectors. Vopex-2M has 50 MHz bandwidth and no resolution loss. The Macintosh II interface cable is included.

Vopex-8M

-----

The Vopex-8M is a video port expander for the Macintosh II video standard and is functional with both the monochrome and color monitor. The Vopex-8M allows eight monitors to be driven by a single Macintosh II at distances up to 50 feet from the computer. It is a device for applications such as training rooms, presentations, video printers and video projectors.

The Vopex-8M connects directly to a Macintosh II video port via a 4-foot interface cable supplied by NTI. All eight output ports are individually buffered. The Vopex-8M operates with monochrome or color monitors because it precisely tracks the input signal.

It is easy to install and operates by plugging any compatible Macintosh II

monitor directly into the 15-pin D output connectors. Extension cables fitted with the same 15-pin D connectors are available in lengths of 25, 35 and 50 feet.

The Vopex-8M is housed in an 8 by 2.5 by 6.2-inch package and powered by 110 VAC.

For more information, search under "Network Technologies".

## HyperCard 1.2.x: System Software Incompatibility

Revised: 9/3/92  
Security: Everyone

HyperCard 1.2.x: System Software Incompatibility

=====

Article Created: 1 May 1991

### Article Change History

-----

09/02/92 - REVIEWED

- For technical accuracy; edited.

### TOPIC -----

If you are using system software version 6.0.6, 6.0.7, or 7.0 you may have heard that you can't use HyperCard 1.2.2 or 1.2.5. The following discussion tells you how to recover when one of these HyperCard versions causes your computer to lock up.

### DISCUSSION -----

HyperCard generates sound when a stack uses play or beep, or makes a sound because you typed a wrong key. With system software version 6.0.6, 6.0.7, or 7.0, HyperCard 1.2.x will lock up when sound is produced for any reason. When this happens, type the Command-Period (Command-.) key sequence. If you were editing a script when the program locked up, the script window closes; if a script was executing, it is canceled.

To prevent HyperCard from causing a lock-up condition, avoid making a sound. Set your Speaker Volume to 0 from the control panel. You won't hear any sounds, but your stack will avoid this sound problem.

If you must play a sound, you can use Farallon's fplay external command (and associated resources) from Farallon's HyperSound™ Toolkit. If you use HyperSound, substitute fplay for every occurrence of the play command or beep command.

If you don't have to use HyperCard 1.2.x with System 6.0.7 or 7.0, don't

use it. If possible use HyperCard 2.0. HyperCard 1.2.x is officially not compatible with System 6.0.7 or 7.0. So you may find problems other than those described above.

Security: Everyone

Macintosh IIsi and LC: Third-Party SIMM Incompatibility

=====

Article Created: 1 May 1991  
Article Last Reviewed: 17 July 1992  
Article Last Updated:

TOPIC -----

Some Macintosh IIsi and Macintosh LC customers have difficulties with third-party 2MB SIMMs installed in their systems. Reported problems include system hanging and/or system crashes sometime after a third-party 2MB SIMMs upgrade. Read the following discussion for more details.

DISCUSSION -----

Apple investigated the problem and discovered that this occurs because some third-party 2MB SIMMs are not compatible with the Macintosh IIsi and the Macintosh LC.

You can determine whether your third-party 2MB SIMMs are compatible with a Macintosh IIsi or Macintosh LC by removing them from the system and installing known good Apple 1MB SIMMs. If the symptoms disappear, the problem was in the third-party SIMMs, and you should discontinue using them in your system.

Contact the manufacturer of the third-party SIMMs if this troubleshooting procedure determines they are incompatible.

This article provides guidelines for reducing ozone emissions from laser printers, as well as suggestions for minimizing the effects of ozone in the workplace.

DISCUSSION -----

### Background

Ozone gas is emitted in detectable levels by almost all laser printers and photocopiers as a by-product of the electrophotographic process. In laser printers the primary source of ozone is the transfer corona wire, which produces an electrical charge to draw the toner powder from the print drum to the paper. Ozone is produced only when the printer is printing.

Manufacturers install special filters to ensure a safe level of ozone emissions. These filters are impregnated with activated carbon. Laser printers that operate without a transfer corona wire emit a negligible amount of ozone gas and do not require these filters. Underwriter Laboratories (UL) provides an ozone emission standard based on OSHA exposure limits.

In general, filter effectiveness can diminish in direct proportion to the number of pages printed. Therefore, filters should be replaced periodically. The ozone filter depends on a steady air flow over the filter to remove ozone. If the printer's fan starts to slow down due to age or mechanical problems, the reduced air flow could cause more ozone to escape. Dust accumulating on the filter's surface can also affect its performance. A properly maintained laser printer that is installed in a well-ventilated area should not expose users to an unsafe ozone level.

Ozone can be an irritant that can cause a range of symptoms including dry throat and nose, headache, and sore eyes. At very high concentrations ozone can have

serious health effects such as nausea, vomiting, pulmonary congestion, and possible premature aging. Ozone is a highly unstable molecule that reverts quickly to oxygen. Ozone concentrations may rise to noticeable levels depending on the rate generated (amount and time) as well as the physical environment (room ventilation and location of workers).

Typically, ozone can be identified by its characteristic odor before it reaches the permissible exposure limit. However, as the concentration of ozone or the duration of exposure increases, a person's ability to smell it may decrease. The current OSHA permissible exposure limit for ozone is 0.1 parts of ozone per million parts of air averaged over an 8-hour work shift.

#### Apple Printers

-----  
Apple is committed to making products that meet or exceed the industry and government health and safety guidelines of every country where we do business. All Apple laser printers are within the limits of the UL guidelines when shipped from the factory to the customer.

The Personal LaserWriter, LaserWriter Pro, and LaserWriter Select series of printers have no transfer corona wire and therefore do not require ozone filters to meet the UL safety requirements. StyleWriter and ImageWriter printers are not laser printers and do not emit ozone.

The LaserWriter, LaserWriter Plus, and LaserWriter II printers have ozone filters designed to operate effectively up to 100,000 printed pages.

However, to ensure maximum effectiveness, Apple recommends service (checking the entire ozone emission control system) and an ozone filter replacement after 50,000 pages or at least once a year. You can print a startup page to determine your laser printer's page count. Dusty conditions or damage to the filter may necessitate more frequent filter replacement. This maintenance check and filter replacement can be done by any Authorized Apple Service Provider.

Proper installation of your laser printer helps to keep the ozone concentrations at a safe level. Choose a well ventilated area. In general, a correctly-designed air conditioning system provides adequate ventilation for printer use. Air circulation is especially important if there are multiple laser printers and/or photocopy machines in an area. A small, enclosed space such as a closet should not be used for printing. Placement in a common area is preferable to placement in an individual's work space. In addition, the fan exhaust should not blow directly in anyone's face.

The laser printer works best in relative humidity between 30 and 70 percent. Lower humidity can slow the natural breakdown of ozone in the air and can reduce the filter's effectiveness.

StyleWriter: Clear the Ink Cartridge When Installing a New One

=====

Article Created: 1 May 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

When installing a new ink cartridge in the StyleWriter printer, you must clear the cartridge. This process, which takes several seconds, is detailed in the StyleWriter User's Manual:

DISCUSSION -----

Here's how to do it:

- 1) Turn the StyleWriter's Power Switch off.
- 2) Press the Ready switch (located on the left) and hold.
- 3) Press the Power switch (located on the right) and release both switches simultaneously.

Do all this twice. You may hear some whirring and clicking sounds as the cartridge is cleaned, but consider it a normal part of the process.

TOPIC -----

Low air pressure during air transport can cause ink to pump from the  
StyleWriter cartridge.

DISCUSSION -----

When transporting a StyleWriter printer by air, always remove the cartridge  
from the printer and then protect it.

The best solution is to carry a new cartridge still in its plastic carton.

To provide minimum protection, place the opened cartridge in a sealed  
plastic bag.

## Personal LaserWriter LS, StyleWriter: Software Compatibility

Revised: 8/8/91  
Security: Everyone

Personal LaserWriter LS, StyleWriter: Software Compatibility

=====

Article Created: 13 May 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

The following list is a compatibility report on the Personal LaserWriter LS, StyleWriter, and TrueType INIT. These are the findings as of February 26, 1991.

Even though Apple has reviewed this list, Apple makes no warranty or representation, either expressed or implied, with respect to this list, its quality, accuracy, or fitness for a particular purpose. In no event will Apple be liable for direct, indirect, special, incidental, or consequential damages resulting from any defect or inaccuracy in this list. Please contact the developer for current compatibility information.

Mention in this list does not constitute an endorsement by Apple Computer, Inc. Third-party product information is provided for compatibility reasons only.

DISCUSSION-----

4th Dimension 2.11 - No problem.  
Acta 3.01 DA - No problem.  
Adobe Illustrator 88 1.9.3 - TrueType problems with text in large point sizes. TrueType quality will not be very high in any point size. Adobe Illustrator 3.0 - Requires Adobe Type Manager 2.0, does not take advantage of TrueType. Prints to Personal LaserWriter LS at 72 DPI.  
Adobe Photoshop 1.0 - No problem.  
Adobe Type Manager 1.2 - No problem.  
Adobe Type Manager 2.0 - No problem.  
Aldus Freehand 2.02 - On Personal LaserWriter LS, may experience crashes when printing graphics which were created as bitmaps in another application and then pasted into Freehand through the clipboard.

The StyleWriter has the following problems: Some features do not work correctly. Lines assigned a width of 0 should print as hairlines, but are printed as 1 point lines. Some rounded rectangles do not print as smoothly as other printers.

AppleScan 1.02 - No problem.

atOnce! 1.01 - No problem.

Canvas 2.1 - No problem.

Claris CAD 1.0v5 - No problem.

Color Studio 1.0 - No problem.

Cricket Draw 1.1.1 - No problem.

Cricket Graph 1.3 - Does not display third-party TrueType fonts.

Cricket Paint 1.0 - No problem.

Cricket Presents 2.0.1 - Times Bold/Italic lines of text sometimes get cut off when printing Personal LaserWriter LS.

Delta Graph 1.5 - No problem.

Design Studio 1.01 - No problem.

Digital Darkroom 1.1a - When printing a select portion of a document to a StyleWriter from a Macintosh SE, the system will crash. Printing a Digital Darkroom document to the StyleWriter, the image is recreated eight times in miniature at the top of the page. A black line appears across the print options box of the StyleWriter driver.

Dreams 1.1 - TrueType text occasionally causes a Personal LaserWriter NT to crash. Printing rotated text to the Personal LaserWriter LS, both the rotated object and the original non-rotated object are printed.

FoxBASE+/Mac 2.01 - TrueType fonts with bitmaps installed have spacing problems when printed, and bottoms of characters are sometimes clipped.

FileMaker II 1.1v2 - No problem.

FileMaker Pro 1.0v1 - No problem.

Full Impact 2.0 - Text is dropped when printing to Personal LaserWriter LS under MultiFinder.

FullWrite Professional 1.1 - No problem.

HyperCard 2.0v2 - No problem.

Image Studio 1.7 - In landscape mode, prints strips of garbage across the page. Happens to a number of printers, including Personal LaserWriter LS and StyleWriter.

LetraStudio 1.5 - Designed only for Letraset's proprietary or Postscript fonts, will not benefit TrueType users.

MacDraft 2.0 - No problem.

MacDraw 1.9.8 - No problem.

MacDraw II 1.1v2 - No problem.

MacWrite II 1.1v1 - Type sizes greater than 127 will not display or print correctly. TrueType fonts will not display correctly in reduced view.

MacFlow 3.0.3 - No problem.

MacInTax 89 2.0 - No problem.

MacMoney 3.5 - No problem.

MacPaint 2.0 - No problem.

MacProject II 2.0v3 - No problem.

MacroMind Director 2.0 - No problem.

MacWrite 5.0.1 - No problem.

Microsoft Excel 2.2a - No problem.

Microsoft PowerPoint 2.01D - TrueType text spacing is bad enough to cause the text to be illegible on the Macintosh II family of CPUs. This problem does not occur with PowerPoint 2.01.

Microsoft Word 4.0b - When printing to the Personal LaserWriter SC or LS, TrueType output sometimes has line breaks in the wrong places, and incorrectly spaced characters.

Microsoft Works 2.0b - No problem.

MiniCad+ 2.0v6 - Double underlines print as single underline on the Personal LaserWriter LS and StyleWriter. StyleWriter drops all underlines at 40% reduction.

More 3.0 - No problem.

Nisus 2.11 - No problem.

Nisus 3.01 - No problem.

PageMaker 3.02 - No problem.

PageMaker 4.0 - No problem.

Persuasion 2.0 - No problem.

PixelPaint Professional 1.0.1 - Printing to Personal LaserWriter LS and StyleWriter often causes a crash.

Quark XPress 2.12 and 3.0 - Problems with large point sizes and reduced and enlarged view.

Quickmail 2.2.3 - Will not print in text mode to the StyleWriter.

Quicken 1.5 - No problem.

ReadySetGo 4.5 - No problem.

ReadySetShow 1.0 - No problem.

SmartForm Assistant/Designer 1.1v1 - Place rotated text on mailing labels template does not print onto every label when printing to Personal LaserWriter LS and StyleWriter.

Statview SE+ Graphics 1.03 - No problem.

Studio 1 1.0 - No problem.

Studio 8 1.1 - No problem.

SuperCard 1.5 - No problem.

SuperPaint 2.0a - When printing complicated text and graphics to the Personal LaserWriter LS, some objects do not print.

UltraPaint 1.02 - No problem.

Vellum 1.0 - No problem.

WingZ 1.1 - When "center" page setup option is selected, extra blank pages are printed out to the Personal LaserWriter SC and LS.

WordPerfect 1.0.5 - No problem.

WriteNow 2.2 - When printing to the StyleWriter, occasionally characters overlap.

## System 7: Memory Requirements

Revised: 9/18/92  
Security: Everyone

System 7: Memory Requirements

Article Created: 15 May 1991

### Article Change History

09/17/92 - REVISED

- To set 2MB capabilities more realistically.

### TOPIC -----

The following information provides guidelines for memory (RAM) usage with System 7.

### DISCUSSION -----

The minimum requirement to run System 7 is a 2MB system with a hard disk. User testing shows that this configuration is functionally equivalent to a 1MB configuration running system 6.0.7. But to take full advantage of System 7 and multiple and/or larger applications you will need at least 4MB of RAM.

Here is a rough guide to memory usage:

- 1MB - Use system 6 with one application.
- 2MB - Use System 7, the Finder, and one application.
- 2.5MB - Use System 7, the Finder, and one or two applications.
- 3MB to 5MB - Use System 7, the Finder, and multiple applications or one large application.
- 5MB to 8MB - Use System 7, the Finder, and multiple large applications and/or documents.

Because of System 7's built-in multitasking, users may launch a second application without quitting from the first. In a 2MB system, this will frequently produce an "Out of Memory" error message. To avoid these messages, users with 2MB Macintosh computers should quit each application before using another. This will not affect their ability to use the multitasking features of System 7, such as background printing and file copying.

System 7 consumes 500K to 1MB more memory than system software 6.0.x. Consider adding one to two megabytes of memory to a Macintosh with limited memory. Or use System 7's virtual memory feature, which is available on the Macintosh SE/30, IIX, IICX, IICI, IIFX, and Macintosh II with optional PMMU.

Because of differences in system ROMs and video architecture, each Macintosh configuration has slightly different system memory usage under System 7. Here are the basic memory profiles of System 7 on various Macintosh computers, using basic install with file sharing and program linking turned off:

| System             | Memory Consumed | Memory Free* |
|--------------------|-----------------|--------------|
| -----              | -----           | -----        |
| Macintosh Plus     | 1056K           | 992K         |
| Macintosh SE       | 1125K           | 923K         |
| Macintosh SE/30    | 1271K           | 777K         |
| Macintosh Portable | 1085K           | 963K         |
| Macintosh Classic  | 1123K           | 925K         |
| Macintosh LC       | 1298K           | 750K         |
| Macintosh IIsi     | 1216K**         | 1085K***     |
| Macintosh II       | 1275K           | 773K         |
| Macintosh IIX      | 1268K           | 780K         |
| Macintosh IICX     | 1298K**         | 750K         |
| Macintosh IICI     | 1202K           | 796K         |
| Macintosh IIFX     | 1185K           | 2911K****    |

\* Available application memory in a 2MB configuration. Any memory above 2MB is available for application use as well.

\*\* 8-bit color video consumes an additional 280K.

\*\*\* 3MB configuration

\*\*\*\* 4MB configuration

Note: Macintosh file sharing consumes an additional 260K.

## System 7: Virex Compatibility

Revised: 7/27/93  
Security: Everyone

System 7: Virex Compatibility

=====

Article Created: 15 May 1991  
Article Reviewed/Updated: 23 July 1993

TOPIC -----

Is the Virex INIT compatible with System 7? Some customers experience printer errors when printing from a system with the Virex INIT v.3.1 loaded. The compatibility reports say it's compatible, but disabling the INIT corrects the problem.

DISCUSSION -----

The Virex program is compatible with System 7, but the Virex INIT is not fully compatible. Note that at least version 3.5 is available, with improved compatibility. Check with Relay Technology (formerly Microcom) for the latest information. Here is Relay Technology's (formerly Microcom) recommended workaround:

- 1) Disable checking on file opening. Checking at disk insertion should work fine.
- 2) Put the Virex INIT in the root level of the System Folder. Create an alias for the INIT, and place it in the Control Panels folder.

### Article Change History

23 July 1993 - Company title changed from Microcom to Relay Technology.  
2 September 1992 - Updated, to note that at least version 3.5 of Virex is available.

AppleShare PC 2.0.X Requires AppleTalk Phase 2

=====

Article Created: 11 April 1991

### Article Change History

-----

08/21/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

I am running AppleShare PC 2.0.1 and a 3Com Etherlink II Board (ThinWire) on an AST 486. When I load ABOTH, I can only see Phase 2 Zones, because our K-Boxes are filtering out Phase 2 traffic. Is there any way I can see our Phase 1 zones the same way I can on my Macintosh using the old EtherTalk Phase 1 drivers? I don't know when we plan to migrate to Phase 2.

### DISCUSSION -----

You need AppleTalk Phase 2 for AppleShare PC 2.0 environments using Ethernet or Token Ring networks. If you could attach to a LocalTalk network, then you could use Phase 1. Otherwise, upgrade your present network to Phase 2 as soon as possible.

## ImageWriter II: Color Printing Applications

Revised: 1/18/93  
Security: Everyone

ImageWriter II: Color Printing Applications

=====

Article Created: 11 April 1991

### Article Change History

-----

1/15/93 - UPDATED  
• Vendor name.

### TOPIC -----

Are there any drivers or programs that print color documents to a ImageWriter II with a color ribbon?

### DISCUSSION -----

Most color applications can print in color on an ImageWriter II with the standard driver. These include SuperPaint 2.0 and Cricket Draw.

Silicon Beach Software's (now Aldus Consumer Division) SuperPaint is a graphics editor for bit-mapped (paint) and object-oriented (draw) art. You can toggle between the paint and draw layers by clicking an icon.

Computer Associates International's Cricket Draw is an object-oriented drawing program that can take advantage of the graphics capabilities of PostScript printers (from the LaserWriter to the Linotronic 300). The package consists of two integrated programs: a drawing window and a PostScript language editor. The programs can be used independently or in conjunction.

To locate a vendor's address and phone numbers, use the vendor's name in a search string.

Macintosh Plus: How to Get the "Propeller" Symbol

=====

Article Created: 11 April 1991  
Article Last Reviewed: 13 July 1992  
Article Last Updated:

TOPIC -----

I want to generate the "propeller" character on my keyboard, but it's produced with the Control-Q key combination, and my Macintosh Plus has no Control key. Is there another way to generate that character directly on the Macintosh Plus?

DISCUSSION -----

We checked through the character sets of all of our fonts and found that symbol only in Chicago under Control-Q. Short of re-defining a font in ResEdit or buying a font-creation product, you can type the character on another Macintosh and save the character in a document that you can transfer (by disk or modem) to your computer. Then, copy the character and paste it into your document.

Apple II: How to Copy Software from 5.25 to 3.5-inch Disks

=====

Article Created: 11 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I want to copy Apple IIe software from 5.25-inch to 3.5-inch disks, using an Apple IIGS--and then run the programs. I get a message that the Apple IIe disk was not formatted in ProDOS. What should I do?

DISCUSSION -----

If the program was written to run under DOS 3.3, it probably won't work under ProDOS. You can use the System Utilities Disk 3.1 to copy the information over to a 3.5-inch disk (the DOS to ProDOS conversion is handled automatically during the copy). However, if the application interacts with the operating system giving DOS 3.3 commands, it won't run. We recommend that you ask the software developer if they have a ProDOS version.

Apple IIGS: RAM Upgrade, CAS and RAS

=====

Article Created: 12 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I am trying to upgrade an early version of the Apple IIGS and having problems with the 256K chips. Please advise me on the need for CAS and RAS and when and where they are necessary. The solder-in chips on the expansion card don't fall into the category listed in the service manual for replacement. They are NEC/Japan D41256C-15.

DISCUSSION -----

The computer requires CAS before RAS refresh. At one time, we were describing the problem chips, but there are too many different RAM manufacturers. Run the Apple IIGS diagnostic 4.0. You must specifically choose the RAM card test to test the card. If the test comes back with "RAM out of spec," you have the wrong refresh. If the test fails, it is a straight failure. If the test passes, the RAM is the correct refresh and in working order.

MacTCP CDEV and EtherTalk

=====  
Article Created: 12 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have an EtherTalk board in my Macintosh II and am using MacTCP and NCSA Telnet to talk to campus mainframes through an Ethernet backbone.

When I select Ethernet in the MacTCP CDEV, I can connect to a host through Ethernet. However, when I have EtherTalk selected, I cannot make a TCP connection to any host. Shouldn't I be able to make a connection with EtherTalk selected?

DISCUSSION -----

EtherTalk in MacTCP is for sending AppleTalk packets with encapsulated TCP. Use this choice for networks that must go through a DDP/IP router. The Ethertalk setting creates the Datagram Delivery Packets that the router expects.

Your network apparently has direct access to the TCP host, which lets you use the straight packets (Ethernet choice). The way to look at this setting is that it's one or the other, not both.

AppleCD SC: Audio Driver Needed to Play Sounds from Hard Disk

=====

Article Created: 12 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I copied the contents of the Explorer CD-ROM to a hard disk, but when I start Explorer from the hard disk, there is no sound. When I put the Explorer CD back in the CD player, and then start Explorer from the hard disk, the sound works. It appears to be accessing files on the CD, rather than on the hard disk. Shouldn't Explorer work just from the hard disk without the CD version present?

DISCUSSION -----

Look at the Macintosh data files and the sound files as being two separate types of CD information. In fact, that is why you have a separate audio CD driver. When you copied the CD over to the hard disk, it couldn't copy the CD audio information. If a sound is something that is generated in a program by the computer (something that would play out of the computer's speaker), that would copy. But, if the sound is a CD audio recording (only heard from the sound outputs of the CD player), then the sound won't copy.

Macintosh IIx: How to Troubleshoot a Monitor/4•8 Card Problem

=====

Article Created: 28 March 1991  
Article Last Reviewed: 9 June 1992  
Article Last Updated:

TOPIC -----

We have four Macintosh IIx systems with the same problem. Each computer is running System 6.0.5 with an Apple 4-bit video card and the Macintosh Display Card 4•8. The cards drive a Macintosh High-Res RGB monitor and a Macintosh Two-Page Display. The color monitors come up, but the Two-Page Displays don't. The same configuration using the old Two-Page Display card and the 4-bit card works fine. What's the problem?

DISCUSSION -----

Here is a troubleshooting sequence that may help you locate the culprit:

- 1) Start up with a known-good System disk with no INITs installed. Some INITs cause problems with video.
- 2) Try swapping out the 4•8 card if you haven't already done so.
- 3) Using the original configuration, insert the 4•8 (the card driving the Two-Page) into a different slot. There might be a problem with the bus lines or the slot itself.
- 4) Swap the logic board, if the slot or bus is the problem.

## Spooler Problem with PostScript Interpreter

Revised: 7/16/92  
Security: Everyone

Spooler Problem with PostScript Interpreter

Article Created: 19 March 1991  
Article Reviewed Only: 9 June 1992  
Article Last Updated: 9 June 1992

TOPIC -----

When I print a multi-page document - say, 3 pages - all pages spool to the spooler as shown in the print spooler window of AppleShare 2.x. The printer initializes and prints page 1 without problem. Either of two things can happen with page 2:

- It never prints or even gets started by the spooler. Thus, the pages to print are 3 and printed pages are 1.
- The job is flushed with an error sheet stating any of the following:

```
undefined;OffendingCommand: ^^^^^^^^ (these are upside down on sheet),
undefined;OffendingCommand:CE6F43C216B8D
,dictfull;OffendingCommand:def,limitcheck;offending command:^^^^^^^A3
(strange foreign characters), canceled by user.
```

If I send only one page at a time to the spooler, everything works well, but it's not very efficient.

DISCUSSION -----

The error messages you received are not related to memory, but to the PostScript Interpreter which resides in the printer.

In general, there appears to be an issue with how the AppleShare print server (version 2.01) is handling PostScript files. The amount of required memory on the print server when capturing one printer is 2MB. The additional memory is not used. The problem would more likely center on how the files are being handled on by the Print Server/LaserWriter. The problem is being reported from the printer.

The "OffendingCommand" is telling us that the interpreter does not understand what has been requested--that is, a Syntax Error is being reported. The "dictFull" error is a report from the PostScript dictionary resident in the printer.

The probability is that packets are getting damaged somewhere in the spooling process on the print server. When the PostScript interpreter receives these damaged packets, it returns the error message or flushes the print job. This could point to a variety of problems with the installation of the server's software.

One thing that may cause this problem involves whether your system has ever run an earlier version of the operating system (and Print Server) before System 6.0.5. If so, you may want to try trashing the ServerFolder and reinstalling the system software and print server. Important: If you do this, make sure you use the Network Products Installer disk to install the print server. The Installer that ships with print server may not work correctly with either 6.0.4 or 6.0.5, but the Network Products Installer will. You may find that you need to reformat and reload the entire hard drive to resolve this problem. Also consider moving up to System 7 and installing AppleShare 3.0.

Macintosh Compact Models: "Hourglass" Effect on Screen

=====

Article Created: 12 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

My Macintosh SE/30 screen displays severe "hourglassing" when there is a large, black area on the screen. I drew a black rectangle (wider than it is high) in MacDraw and then moved it around the screen. The left and right sides of the screen closest to the rectangle squeeze in towards the rectangle (hourglassing). I have replaced everything in the unit at least once. I also removed the hard disk, but that had no effect.

DISCUSSION -----

The hourglass effect is common to all of the compact Macintosh computers. It's more pronounced on some systems than on others. To reduce (but not eliminate) the effect, turn down the internal brightness level. Try this and experiment with other compact Macintosh computers.

Apple IIGS: How to Mix a 3.5-inch Drive with Other Drives

=====

Article Created: 12 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I am using an Apple IIGS with a DuoDisk drive and a single 5.25-inch drive. The controller cards are in slots 5 and 6. I want to use a 3.5-inch drive along with the other drives. I installed an Apple UniDisk 3.5-inch drive with its controller in slot 4 and tried slot 7 with no success. I changed the slot settings under the Control Panel each time. How can a 3.5-inch drive be used with the described 5.25-inch drives?

DISCUSSION -----

Try this configuration:

- 1) Plug the UniDisk 3.5-inch directly into the back of the computer (no controller).
- 2) Plug the DuoDisk into the port on the UniDisk 3.5 disk (no controller).
- 3) Plug the single 5.25-inch UniDisk into a controller card in slot 7.

Set the Control Panel as follows:

|         |            |
|---------|------------|
| slot 5  | smart port |
| slot 6  | disk port  |
| slot 7  | your card  |
| startup | scan       |

This configuration tries first to start up from the UniDisk 5.25. If no disk is found, then it looks to drive 1 of the DuoDisk. If no disk is found, then it goes to the UniDisk 3.5.

Macintosh System Errors: Possible Sources

=====

Article Created: 15 April 1991  
Article Last Reviewed: 25 June 1992  
Article Last Updated:

TOPIC -----

I just installed a new hard disk in my Macintosh II and am getting all sorts of system errors. The dealer who installed the hard drive insists that the problems are not hardware-based. The only software that I have been able to install is System 6.0.5.

Trying to install anything else generates system errors. (Sometimes just starting the computer and opening the System Folder generates errors.) I get errors ID =10, ID =28, ID =03, and ID =01, not to mention a "line 1111 trap error."

DISCUSSION -----

Most system errors sound like gibberish to most of us, but if you were writing a new program for the Macintosh, the error number would tell you that you have a problem with your code. But, when you are running a compiled program and get this error, all it tells you is that the software crashed. Some errors, like 25, are "out of memory." This one does make sense. In your case, check through these possible problems:

- 1) This is a third-party drive that was formatted with HD Setup. You have to use a utility from the third-party manufacturer to format a third-party drive. Apple's utility is only for Apple's hard drives.
- 2) The hard drive is defective.
- 3) Some other file within the System Folder is causing the crashes: a screen dimmer, startup sound, electronic mail, or something similar.
- 4) The computer could have a memory problem in RAM or the logic board.

## MacDFT, PF10 Function, and 32798 Error

Revised: 4/2/92  
Security: Everyone

MacDFT, PF10 Function, and 32798 Error

=====  
Article Created: 15 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I am running MacDFT on my Macintosh IICx, with System 6.0.5. I am accessing PROFS from our mainframe. When I ran version 1.0 of MacDFT I was okay, but as soon as I upgraded to version 1.1, I began experiencing problems when I used the PF10 function. The system hangs and reports a 32798 error and that communication with the host has been lost. I did try switching settings within the program, but to no avail. We are using a coax connection.

DISCUSSION -----

A 32798 error is a TIMEOUT\_ERR, or "request timed out" and suggests a problem between the terminal and controller. We have seen similar problems when a non-IBM controller is used (Apple only supports IBM 3x74 controllers). And this type of error is much more prevalent when one is using DFT mode as compared to CUT.

MacDFT 1.0 only supported CUT mode, and MacDFT 1.1 supports either. You may be able to use MacDFT 1.1 in CUT mode to work around this problem. However, you may encounter other incompatibilities if you are not using IBM controllers.

A PF10 from the PROFS main menu is an add-on automatic reminder. This worked flawlessly for us during our testing with MacDFT 1.1.

Another possible problem area is the type of cable used. When coaxial devices are designed, we usually assume RG62/AU, but often unshielded and less-expensive cable is substituted, like RG59 or RG58. Either of these latter two cable types could cause problems.

TOPIC -----

I am looking for software that allows modem sharing over an AppleTalk network.

DISCUSSION -----

Here are two possibilities:

The three-port C-Server from Solana Electronics lets multiple users on an AppleTalk network share up to three serial peripherals. These devices may be modems, OCR readers, plotters, mainframes, printers, typesetters, protocol converters, or any combination of RS-232 connections.

SilverServer Software from La Cie, Ltd. allows the sharing of Hayes-compatible modems and hard disks over a LocalTalk network or telephone line. The maximums are 32 users and 224 drives per network. You also get DiskDup+ and SilverLining utility software.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

Editor's Note 22 June 1992: Solana has discontinued business to our knowledge, so we are unable to refer you to them directly for further information.

Apple II AppleShare Network: Troubleshooting Freeze-Ups

Article Created: 15 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have three AppleShare networks. One has all new Apple IIGS computers, and the other two are mixed with Apple IIe systems, plus both old and new Apple IIGS computers. They all come up fine but, two or three hours later they freeze. When we restart the computers most (not always the same ones) freeze at the IIGS loading gauge. This happens only on the new IIGS models.

I have about thirty Apple networks installed. On some of them, new Apple IIGS computers froze from the beginning. Replacing their logic boards seems to fix the problem. However, on the last one, the problem just moved to another, previously "clean" computer.

DISCUSSION-----

First, check for bad RAM, the most common cause of a system locking up during startup. This would explain why swapping logic boards cured the one case.

Second, check for bad software on server. In this case, this diagnosis is more likely, because the condition is appearing on more and more systems. Try re-installing the server, making sure you use the Network Products Installer disk. Re-install the following:

- 1) System 6.0.5
- 2) AppleShare 2.0.1
- 3) AppleShare Apple II Setup 2.1.1
- 4) GS/OS 5.02

TOPIC -----

Is there a problem with putting three or more NuBus cards in a Macintosh II family system?

DISCUSSION -----

Not inherently, but the more cards you install, the greater the drain on the power supply. If the power supply was bad, it might not show up until it was under this increased load. Some card makers don't follow Apple specifications about power draw per card. Out-of-spec cards can strain the power supply.

## 32-Bit QuickDraw and Print Monitor Problem

Revised: 8/9/91  
Security: Everyone

32-Bit QuickDraw and Print Monitor Problem

=====

Article Created: 28 March 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have a Macintosh IIfx with 8MB of RAM, an 80MB hard disk, and a 24-bit video board. I am running System 6.0.4 with MultiFinder and 32-bit QuickDraw active. I am trying to print using the background printing option. When I try to print a 24-bit image, the program quits with a MultiFinder 01 error (a bus error, I believe), but not until it has already fed the print job to the print monitor. I have noticed this from Pixel Paint Professional, Microsoft Word 4.0, and other programs.

I have completely trashed my System Folder twice to no avail. However, if I disable background printing, it works fine (no MultiFinder 01 bombs). The only thing that does not seem to work properly is the memory allocation to the print monitor. No matter what I set it to, it seems to take the "recommended" amount of memory, rather than the allocated amount.

Do I have a bad copy of the System disks? Would you update to System 6.0.5 solve the problem? Do I need LaserWriter 6.0.1 to print 24-bit images to the NTX (or should 6.0 work?)

DISCUSSION -----

We recommend upgrading to 6.0.1 LaserWriter and Laser Prep, so that you are using the most current drivers. You should also have Color/Greyscale selected in the Print dialog box.

There is a possibility that you are running the Installer (we hope you are using the Installer) from damaged diskettes. If you have a known-good locked set, throw away your System Folder and use these good disks to reinstall by running the Installer.

## Macintosh to VAX Connectivity and Fatal Error 1020

Revised: 2/8/93  
Security: Everyone

Macintosh to VAX Connectivity and Fatal Error 1020

=====

Article Created: 29 March 1991

### Article Change History

-----

02/08/93 - RETITLED

- To accurately describe the article.

### TOPIC -----

I am having problems with my Macintosh Plus (System version 6.0.4) communicating with our VAX system. We are using PacerLink 5.3 for VAX access via AppleTalk (Fastpath access onto fiber-optic Ethernet backbone). My Macintosh occasionally freezes, forcing me to turn it off to reboot. Today, I got a dialog box that told me I had a Fatal Error #1020. According to the (somewhat sketchy) information I have, that should indicate an AppleTalk problem.

What specifically does that error indicate, and where should we concentrate our search for the source of the problem?

### DISCUSSION -----

If there are other users in your general area, follow these diagnostic steps:

- 1) Start by taking the Macintosh over to one of those network connections and see if the same problem occurs. If it does not occur there, verify the connection at the original location. If so then continue with the next suggestions.
- 2) Check out the software at the Macintosh end. If possible, try another user's software (or hard disk with the software on it), so you can identify whether or not you have a software problem.

If other users are not experiencing the same problem, the network is not at fault. Our guess is that it's a software problem at your machine either in Pacer (likely) or in the System software (doubtful).

AppleTalk: How to Upgrade to Phase 2 to Use PATHWORKS

=====

Article Created: 29 March 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

We need to upgrade our AppleTalk network to Phase 2 to use PATHWORKS. Our network consists of six zones, five are separated by Shiva NetBridges, while the other is separated by Cayman GatorBoxes. From what I've read, it looks like all I need to do is set the GatorBoxes to AppleTalk rout using Phase 2 instead of Phase 1 for us to be "upgraded." This sounds a bit too easy.

What else do I need to do? Currently, the only other devices we have are Macintosh computers, LaserWriter printers, some NetSerials and NetModems, and a Netway.

DISCUSSION -----

Easy is what Macintosh is all about! Phase 2 has to be implemented on routing devices, so the GatorBox and the Shiva NetBridges also need upgrading. Check with Shiva on their plans or procedure for upgrading the NetBridge to Phase 2. That is basically all there is to it; the computers on the network have no requirement for an upgrade to Phase 2.

## LaserWriter: How to Upgrade Drivers on an AppleTalk Network

Revised: 8/9/91  
Security: Everyone

LaserWriter: How to Upgrade Drivers on an AppleTalk Network

=====

Article Created: 29 March 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

All LaserWriter drivers must be exactly the same on an AppleTalk network in order to prevent printer reinitialization every time someone prints. On the other hand, you can use any version printer driver with any version of System 6.x.x software. So if five people were running SEs with System 6.0.4 and LaserWriter driver 6.0, and a sixth machine running under System 6.0.5 (a IIfx, for example), the sixth machine could still run LaserWriter driver 6.0. (It's less hassle to make one adjustment than five.) Right?

Is there an enhanced functionality to LaserWriter driver 6.0.1, so that to get the absolutely best results, it would be best to upgrade the 6.0.4 SEs over to LaserWriter driver 6.0.1?

DISCUSSION -----

Yes. You are correct in your first paragraph above, and if there is a new LaserWriter/Laser Prep file introduced you should be able to upgrade to that driver with no other system upgrade, unless it was so specified.

There was an upgraded Print Monitor with the 6.x drivers. Version 1.3 was distributed with the System 6.0.5 suite of diskettes while version 1.2 was distributed with the System 6.0.4 suite of diskettes. The 1.3 version would probably contain the enhancements necessary for use with any of the current printer drivers.

## Data General: Terminal Line Dropped for Macintosh

Revised: 8/9/91  
Security: Everyone

Data General: Terminal Line Dropped for Macintosh

=====

Article Created: 29 March 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have a Macintosh IIci with a 40MB internal CMS drive with 4MB RAM. It replaces a Data General terminal. It's connected to our terminal line (DB-25 male) using a female-to-female gender changer and an Apple IIe/ImageWriter II cable (third-party) connected through the modem port.

Thus, I use my Macintosh part-time to communicate with a Data General (Versaterm does the DG emulation). Communication works flawlessly, and everything else is fine until I shut down the Macintosh at the end of the day. When I turn on the Macintosh in the morning, the DG has disconnected the line. I have to contact our systems people and have the line reconnected. Apparently the DG is polling the lines at night and something is timing out and disconnecting them.

I disconnected the cable from the back of the Macintosh at night, and everything works fine when I reconnect it in the morning. Note: People can shut off their terminals at night without the line being disconnected. However, I don't want to unplug the cable from the Macintosh every night.

Is the Macintosh doing something out of the ordinary with the serial ports when the machine is off?

DISCUSSION -----

We suspect the cable may have a pin jumpered in it that may be causing this problem when the mainframe polls the Macintosh in the evening. The possibility is that pins 6 and 8 (jumpered), which should go to 20 on the DG, may be pulled down signal-wise and responding as if the connection is gone. This closes the line for security at the mainframe.

When the cable is disconnected from the Macintosh, those signals are cancelled, because there is not a continuous loop inside the serial port and the mainframe can tell that. When the cable is connected, it goes through the serial port and incorrect cabling may respond as if the connection has dropped.

We suggest you verify that the cable you are using is the correct configuration and not having any extra pins jumpered inside. When the Macintosh is off, nothing happens with the serial port (no power, no activity).

We cannot tell you if there is a way to have the mainframe discontinue the polling overnight. That may be one workaround besides verification of the cable.

Responder, Background, & AppleTalk: Purpose in System Folder

=====

Article Created: 22 March 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I am having problems with System 6.0.5 bombing. What are the functions of Responder, Background, and AppleTalk in the System folder? Are they needed? Could they be the cause of my problems?

DISCUSSION -----

- You can remove Responder if you are not using Inter•Poll for network troubleshooting.
- Backgrounder writes temporary files for background printing under MultiFinder. Do not delete this file.
- AppleTalk is a patch to the AppleTalk that is in ROM. It is needed for the efficient use of any network device. Do not remove it.

If you are having bomb problems, we suggest you start up from the System Tools diskette, trash your current System folder, and use the Installer to re-install the System folder.

Macintosh IICx: Troubleshooting Startup Freezes (4/94)

=====

Article Created: 29 March 1991  
Article Reviewed/Updated: 5 April 1994

TOPIC -----

I have an intermittent problem with my Macintosh IICx. It freezes when I start it up.

The system does not have any INITs in the System Folder. I re-installed System software 6.0.5 using the Installer. The system has a Mac286 card and an Irma Link card in it with 5MB of memory. The system board, memory, and power supply have been replaced.

DISCUSSION -----

To troubleshoot this problem follow these steps:

- 1) Remove the Mac286 and the Irma Link cards to isolate the problem to either the cards or the CPU.
- 2) Completely throw away the System Folder.
- 3) Re-install the System Folder from known-good, locked System diskettes.
- 4) If the problem persists, try swapping the keyboard, cable, and mouse.
- 5) Have a service provider run diagnostics to determine if there is a hardware problem.

## Macintosh IIfx: Proper Placement of SCSI Terminators (11/94)

Revised: 11/8/94  
Security: Everyone

Macintosh IIfx: Proper Placement of SCSI Terminators (11/94)

=====

Article Created: 22 March 1991  
Article Reviewed/Updated: 08 November 1994

TOPIC -----

When my Data Frame drive is the only device in the SCSI chain, my Macintosh IIfx starts up, but whenever I have another SCSI device attached, the system won't start. It doesn't matter whether the external SCSI is the drive or the scanner. The SCSI devices are all at different addresses and the external device on the end of the line has termination.

The Data Frame was checked out here on a Macintosh IIci with an external Rodime 140MB SCSI drive. I had no problems with this configuration.

DISCUSSION -----

The only thing we are concerned with is the termination of both the internal drive and the external devices. The IIfx requires the use of the black terminator rather than the standard platinum-colored terminators of other Macintosh computers. This terminator is included with the IIfx in the finished goods box.

We would also verify that the SCSI filter is installed on the internal SCSI bus at the drive. This filter connects between the SCSI ribbon cable and the drive itself and provides some additional termination internal to the IIfx.

## Aristotle: error occurred in your user folder Message

Revised: 7/1/91  
Security: Everyone

Aristotle: "error occurred in your user folder" Message

=====

Article Created: 4 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have an AppleShare network with 20 Apple IIGS workstations. The network has experienced numerous problems this year. Today, while exiting AppleWorks, nine systems locked up and displayed this message:

An error occurred in your user folder: see the administrator

At the same time, five networked ImageWriter II printers locked up. One system in the middle of this line had no problems. When we tried to restart the workstations, some went into BASIC, and some displayed garbage. Now, all systems are totally down.

DISCUSSION -----

Based on the error message, the problem seems to be on the server itself. Go into the users' listing and re-establish the preferences for the users. That may help, and avoid a time-consuming backup and reinstall.

If that does not cure the problem, go back to the most recent backup and restore that data. There may be a corruption within Aristotle itself. If a backup is not available, then recreate the Users and Groups files, and stop short of re-installing Aristotle.

Finally, if the problem still persists, re-install Aristotle and re-create the users and groups.

## ImageWriter LQ: Printing on Entire Ribbon

Revised: 8/9/91  
Security: Everyone

ImageWriter LQ: Printing on Entire Ribbon

=====

Article Created: 4 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have an Apple ImageWriter LQ printer that prints only on the top portion of the black ribbon. According to the manual, the ribbon assembly should shift up and down for an even use of the black ribbon. When the printer is first turned on, the ribbon mechanism shifts down and stays there.

I discovered that when the ribbon is not in the printer, the assembly does shift. When should the shift occur with a black ribbon? What triggers the shift?

DISCUSSION -----

The ImageWriter LQ with the 2.0 driver prints on all four bands of the ribbon on multi-page documents; it should use all bands equally. It moves up through the different bands on each page, so if you print multiple one-page documents, it may stay on the top band. Make sure that you do not turn off the printer between print jobs. This resets the ribbon to the top band.

## LaserWriter Plus: Double-Blinking Status Light

Revised: 8/9/91  
Security: Everyone

LaserWriter Plus: Double-Blinking Status Light

=====

Article Created: 4 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I'm having a problem with a LaserWriter Plus (recently upgraded) connected to an IBM. The "Busy" status light sometimes has an uncharacteristic "double blink," as opposed to the normal "single blink" when processing jobs. Also, when PostScript jobs from some applications are completed, the status light does not turn off, but instead starts to "double blink." What does a "double blinking" status light mean?

DISCUSSION -----

The double-blinking light is normal. In certain instances, the yellow light continues to flash, indicating it is processing a job. This is most evident when you do a manual feed and insert the paper before the red jam-light comes on. Also, if an end-of-page command is not sent when printing from an MS-DOS machine, the lights continue to flash.

## LaserWriter IINT: Problems Printing from WordPerfect

Revised: 8/9/91  
Security: Everyone

LaserWriter IINT: Problems Printing from WordPerfect

Article Created: 4 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have an IBM Model 60 server and two Model 70/386 workstations tied together with IBM Token-Ring hardware and cables. Server and workstations run IBM LAN Program 1.03 and LAN support program. WordPerfect 5.1 LAN version runs on the server. The workstations have devices attached to the serial ports. The server is connected to the LaserWriter IINT through a serial cable. The spooler runs on an IBM-LAN program. Our LaserWriter IINT is in standard LaserWriter mode, not Diablo mode.

Printing from WordPerfect (through the parallel port) works unevenly. After printing a while, it quits. I noticed that when I send a simple one-page document to the LaserWriter IINT, the green "working" light blinks for a couple of minutes and then goes out.

WordPerfect support told me to print a file called "ehandler.ps" (provided by WordPerfect) to the printer (from DOS). He said this would print error messages when a PostScript job did not work satisfactorily.

I sent the ehandler.ps file to the printer, and the job printed fine. Afterwards, a sheet printed that said "Error: timeout" and indicated that the command that had failed was "timeout." Although I can print one-page jobs okay, longer jobs don't print properly; they only generate an error sheet.

What do I need to set or change?

DISCUSSION -----

We have three things for you to try:

- 1) Temporarily disable the spooler to see if there is a problem with the communication between it and the printer.
- 2) Verify the correctness of the cable. Here are the correct pinouts for both a DB-9 and DB-25 cable to the LaserWriter II.

| IBM PC/AT |   | LaserWriter |       |
|-----------|---|-------------|-------|
| DB-9      |   | DB-25       |       |
| -----     |   | -----       |       |
| (RXD)     | 2 | 2           | (TXD) |
| (TXD)     | 3 | 3           | (RXD) |
| (DTR)     | 4 | 6           | (DSR) |
| (SG)      | 5 | 7           | (SG)  |
| (DSR)     | 6 | 20          | (DTR) |

|                          |                                      |
|--------------------------|--------------------------------------|
| IBM RS-232 Serial (DTE)  | LaserWriter / LaserWriter Plus (DTE) |
| (DB-25 Female Connector) | (DB-25 Male Connector)               |

|   |       |    |
|---|-------|----|
| 2 | ----- | 3  |
| 3 | ----- | 2  |
| 5 | ----- | 4  |
| 6 | ----- | 20 |
| 7 | ----- | 7  |

- 3) Verify that the LaserWriter's DIP switches are correctly set. They should be: 1 up and 2 down (9600 bps and PostScript).

Macintosh: When It Won't Let You Throw Files Away

=====

Article Created: 5 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have a Macintosh Plus running System 6.0.3 and an Apple 20MB hard drive. I want to eliminate old data and old programs, but the system won't let me throw away any programs, data, or folders. The files are not locked, and the hard drive is very slow.

DISCUSSION -----

There are a couple of things we would try.

First, rebuild the hard disk's desktop file by holding down the Command and Option keys while you start up the system. Hold both keys down until the dialog box appears asking you to confirm the desktop rebuild.

If that does not help, boot from a locked System Tools diskette and try to throw away the files, folders, and the System folder. Then, reinstall the System using the Installer. Another solution might be holding the option key down while throwing something into the trash

Once you have a re-installed the System file, do a file-by-file backup of the drive, re-initializing the drive, and then restoring the data and applications.

TOPIC -----

Is it true that Macintosh Plus ROMs won't work with some third-party SIMMs? I bought some 1MB NEC SIMMs and get consistent "sad Macs" when I try to start the Macintosh Plus with them installed.

DISCUSSION -----

We don't know of any reason to upgrade ROMs for SIMM compatibility, nor of any incompatibility with the mentioned SIMMs and the Macintosh Plus. If the Macintosh bombs only with those SIMMs installed, try them in another Macintosh model to see if it is related to the Plus or if one of the SIMMs is bad.

## Disk First Aid 7.2: Purpose (8/93)

Revised: 8/31/93  
Security: Everyone

Disk First Aid 7.2: Purpose (8/93)

Article Created: 8 April 1991  
Article Reviewed/Updated: 23 August 1993

TOPIC -----

What is Disk First Aid and what does it do?

DISCUSSION -----

Disk First Aid is a utility which verifies the directory structure of any hierarchical file system (HFS) based storage volume. Many hard disk drives, floppy disk and compact disk (CD) drives are examples of HFS-based storage volumes.

If imperfections are found within a volume, Disk First Aid can be used as a "first step" to repair the defects/ if a volume has suffered several corruption other utility programs or repair methods may need to be used.

Disk First Aid 7.2 (released August 1993) checks for and repairs following volume attributes:

- Disk volume
- Extent B-tree
- Extent File
- Catalog B-tree
- Catalog File
- Catalog Hierarchy
- Volume Info
- Search for locked volume name

You can save the results of a verification or repair scan as a TeachText (text) document.

Disk First Aid cannot scan for deleted or trashed files or folders on a volume. There are several third party products which perform these tasks, however.

For further information on terms used in this article, please search the Tech Info Library for the article: "Macintosh: File System Specifications & Terms (7/93)"

## QuickDraw: Using It with an 8-bit Video Card

Revised: 8/10/91  
Security: Everyone

QuickDraw: Using It with an 8-bit Video Card

Article Created: 8 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

When and why should one use 32-bit QuickDraw? I assumed it was only for 24-bit color cards, but the Read Me in the Color folder in the 6.0.5 suite says it can also enhance 8-bit (256-color) situations.

I am using a Macintosh II with the original Macintosh Display Card 4•8, running 4 bits (16 colors), System 6.0.5, 5MB RAM, and Laser Driver/Prep 6.0.1. Would 32-bit QuickDraw help? (I presume if you use 32-bit QuickDraw, you should also use a 6.0.x-series Laser Driver/Prep.)

Do applications have to be specially written to take advantage of 32-bit QuickDraw?

Finally, with regard to the 6.0.x series Laser drivers, is there any safe, easy way to make black and white the default choice?

DISCUSSION -----

In a Macintosh with an 8-bit video card, the only benefit is some dithering changes on 8-bit images. The use of 32-bit QuickDraw doesn't demand 6.0.x Laser drivers. The installation of 32-bit would probably not greatly improve your configuration.

Applications must be "32-bit clean" to take advantage of the capabilities of the newest 24- and 32-bit color boards. You will see applications begin to advertise that they are clean as more boards become available.

There is a modified version of the 6.0.x drivers called 6.0.1z that defaults to black and white. You might try it. For more information on 32-bit QuickDraw, see the article in the Tech Info library, titled "32-Bit

QuickDraw Information".

## FileMaker II: Network Problems

Revised: 7/24/92  
Security: Everyone

FileMaker II: Network Problems

=====

Article Created: 22 March 1991  
Article Last Reviewed: 24 July 1992  
Article Last Updated:

TOPIC -----

I am supporting an 11-node AppleShare network (2 Macintosh SEs and 9 Macintosh Plus computers). The software versions are:

- AppleShare II 2.0.1
- Finder 6.1
- System 6.0.3
- FileMaker II 1.1v2

Cabling for this network is PhoneNet wired in a passive star. Total cabling distance is less than 400 feet. All 11 workstations can log in to the file server, print, and use the InBox E-mail system. All workstations have 2.5MB of RAM.

My problem is that although nine workstations can share the same file from FileMaker II concurrently, the other two workstations are denied access to the shared FileMaker II database.

The two "denied" computers share a common cable with one other Macintosh. However, they are at the end of the leg. These are Macintosh Plus computers. I cannot get these machines to share the same database, even if they are the only machines trying to log in. What's the problem?

DISCUSSION -----

You mention they are at the end of the leg of the star: have you tried moving one or both Plus systems to a different connector to see if that's the problem? If the problem continues at another physical location and you can log on to the server, we suggest that the problem lies with FileMaker rather than the Macintosh or the network.

Because you can access the server; and print, copy files, and so on; we assume that basic network integrity is good; and the problem lies with FileMaker itself. It appears that you are exceeding the maximum number of simultaneous users. We would suggest that you contact Claris for a solution, if our suggestions don't alter the performance of these two systems.

## Apple IIGS Network: Looking for AFP filesystems Message

Revised: 8/12/91  
Security: Everyone

Apple IIGS Network: "Looking for AFP filesystems" Message

=====

Article Created: 8 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have a problem concerning a Macintosh file server and Apple IIGS lab. I installed the AppleShare File Server software and Aristotle on a Macintosh SE. Ideal Learning installed their Podium software. The installation was successful and the lab operated for two months without a problem.

During the summer, the lab was moved to another room and reconnected. After a few days, problems developed. When the Apple IIGS computers were turned on, we got the normal routine (the dots going across the top of the screen), and then, when the message "Looking for AFP filesystems" came on, the IIGS screen showed what appeared to be hex characters, and it locked up. The IIGS had to be restarted.

The file server appeared to be working without problems. I then re-installed the AppleShare File server software, and the same thing happened. Next, I re-installed the Macintosh OS, updating to System 6.0.5. The same thing happened again. I reformatted the hard disk and restored from a backup. The system worked for about a week, when the same problems developed.

There are five other labs in the school system with the identical set-up, and they are all operating without any problems.

DISCUSSION -----

We would check the server and make sure that GS/OS has been properly installed--with the Installer--and that all the necessary files are there. After you verify that, take a look at each Apple IIGS computer.

If the problems show up on all systems in this network, take one of them to

another network and see if it starts properly there. Also, check to see what is happening before the network fails. Maybe a student is trashing some crucial files within the server folder or within the GS/OS system folder on the server.

Macintosh: Correcting Garbled System Numerals

=====

Article Created: 8 April 1991  
Article Last Reviewed: 15 May 1992  
Article Last Updated: 15 May 1992

TOPIC -----

All the numbers in my Control Panel, on SuperClock, in the Get Info box, in About the Finder, or any other system-related window are messed up. For example, in About the Finder (About This Macintosh in System 7), you might see "Largest unused Block: 1,?22K" instead of "Largest unused Block: 1,722K", or "Total Memory: 3,89>K" instead of "Total Memory: 3,898K" My SuperClock says "6:2 PM" instead of "6:20PM."

Occasionally, a number is represented by a character. However, when I type numbers into applications like Word or Excel, the numbers are always represented correctly.

DISCUSSION -----

There are two possible solutions worth trying. First, try resetting the parameter RAM (PRAM). PRAM could be causing some of the numbers to be misrepresented. (Search for "PRAM" in this database for how to reset PRAM. The procedure is different for System 7.x than for System 6.x.)

If the problem persists, throw away the System Folder in use and reinstall from known-good, locked, original System diskettes.

Finally, if none of these works, have the logic board checked. It may need to be replaced.

Macintosh: SLIP, TCP, and PPP

=====  
Article Created: 11 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I use DAL and want to connect remotely from a Macintosh IIfx to a Sun workstation. I also want to have terminal emulation and file transfer. Do you know of a TCP/SLIP product that does this?

DISCUSSION -----

SLIP is an asynchronous serial line protocol developed for running TCP/IP over serial communications lines in a point-to-point configuration. SLIP was developed to transmit IP packets over low-speed, sometimes noisy, asynchronous communications lines where error recovery and an efficient line protocol is needed. A new, serial, line protocol named "PPP" is replacing SLIP. PPP uses an even more efficient means of establishing a point-to-point IP connection.

MacTCP 1.0.2 has hooks for different third-party link-layer modules. This helps the development of interfaces to SLIP, PPP, and any other link layer, like broadband, X.25, FDDI, and so on. Apple does not provide support in MacTCP for SLIP or any other serial line protocol. These have to come from third-party developers.

## LaserWriter IINTX: ROM Upgrade and Font Rendering

Revised: 7/1/91  
Security: Everyone

LaserWriter IINTX: ROM Upgrade and Font Rendering

=====

Article Created: 25 March 1991  
Article Last Reviewed: 8 June 1992  
Article Last Updated: 8 June 1992

TOPIC -----

Does the new version of PostScript on version 3.0 of the ROMs on the LaserWriter IINTX speed up Font rendering as does the new PostScript in the Personal LaserWriter IINT?

DISCUSSION -----

The new version of PostScript for the LaserWriter IINTX does not improve font rendering in most operational modes. The major differences between the 3.0 and older ROMs are:

- Software switching from LaserJet emulation to PostScript
- Font cleanup in LaserJet emulation
- Better disk management routines
- PostScript 51.8.

Security: Everyone

Hard Disk 20SC: Can't Be Startup Device for Unenhanced Apple IIe

Article Created: 19 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

The Hard Disk 20SC connected to my Apple IIe is not booting. However, when I boot ProDOS 1.1.1 from the floppy drive, the system recognizes the data on the Hard Disk 20SC. The ProDOS disk shows the "slot configuration" as slot 7 being used. The drive shows that the BASIC.SYSTEM and PRODOS files are there. Is there supposed to be another file?

DISCUSSION -----

In general, a bootable ProDOS volume needs only the PRODOS and BASIC.SYSTEM files. You can substitute a different file for BASIC.SYSTEM as long as the substitute's name ends with .SYSTEM and has a filetype of SYS. If you have only these two files, you boot to BASIC.

The most likely cause is that your Apple IIe is unenhanced. Only the enhanced Apple IIe recognizes the SCSI interface card during startup. An unenhanced Apple IIe can't start up from the device, but you can use it after starting up from some other device.

If this is the problem, get an Apple IIe Enhancement Kit (Finished Goods part number A2M2052, SRP).

Security: Everyone

Macintosh Display Card 8•24 GC: HyperCard 1.2.5 Compatibility

=====

Article Created: 21 April 1991  
Article Last Reviewed: 9 June 1992  
Article Last Updated:

TOPIC -----

I just got a new Macintosh Display Card 8•24 GC for my Macintosh IIfx (running System 6.0.5). I am running into a problem when trying to run HyperCard 1.2.5. If the accelerator is disabled, everything is fine. However, with the accelerator on, the outlined hand in HyperCard turns black and the system does not react when I press buttons. Only browsing is affected. When a button tool (or other tool) is selected, it seems to work okay.

I need to use a custom HyperCard 1.2.5 stack off and on during the day. Right now, I must restart the computer to disable the card to use HyperCard.

DISCUSSION -----

An unadorned HyperCard 1.2.5 stack should work fine. Your stack may have an XCMD or XFCN that is interfering with the altered QuickDraw command set that the Macintosh Display Card 8•24 GC uses. As externals are processed by HyperCard when a stack opens, any incompatibility (not bugs, though) shows up.

We recommend that users of the Macintosh Display Card 8•24 GC upgrade to HyperCard 2.0, mainly for the sake of performance. HyperCard 2.0 uses true QuickDraw commands, which the Display Card 8•24 GC accelerates. (Earlier versions of HyperCard bypassed QuickDraw entirely.) Older stacks should work, but performance will not improve.

## A/UX: Macintosh IIfx Requires A/UX 2.0 or Later

Revised: 9/24/92  
Security: Everyone

A/UX: Macintosh IIfx Requires A/UX 2.0 or Later

Article Created: 19 April 1991

### Article Change History

-----  
08/31/92 - REVIEWED  
o For technical accuracy.

### TOPIC -----

I bought an Apple HD 80SC drive with A/UX 1.1 installed. When I connected the drive to a Macintosh IIfx (with the special IIfx terminator), I couldn't launch A/UX. However, other folders on the drive open fine. With A/UX, I get error messages:

```
SCSI RESET
DISC C1D0S0:SCSI TIMEOUT
GENERIC DISC C1D0S0 FATAL ERROR:LOGICAL BLOCK 0,
    PHYSICAL BLOCK 1869875042
CHROOT FAILED
SASH#
```

### DISCUSSION -----

To run A/UX on the Macintosh IIfx, you must have A/UX 2.0 or any later version. Version 1.1 gave you this particular error message, because it doesn't know how to use the IIfx DMA SCSI scheme. If you want to use A/UX on a IIfx, you must upgrade.

PrintServer: Length Limit on Device/Zone Names

=====

Article Created: 22 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

My Macintosh II is in a zone (Advertising/Professional Computers Zone) that is separated from the rest of our network by a bridge. The PrintServer captures the printer with no problems. I can see the PrintServer listed in the Chooser, and I can select the PrintServer, but when I try to print, it says "LaserWriter «PrintServer» could not be found..."

DISCUSSION -----

Your zone name may be your problem.

The Chooser supports a maximum of 31 characters for a device or zone name, and your name is 34 characters. When the additional device names are appended to the data packet to make a complete address string, the string gets truncated by a lower-level AppleTalk routine. At that point, the name string doesn't match the actual address, and a search for that device fails.

Shorten the zone name to something under 30 characters. Also check device names to verify that they, too, are under 30 characters.

Personal LaserWriter NT: Using with Amiga 2500

=====

Article Created: 18 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Are there drivers for the Amiga 2500 that let it communicate with the  
Personal LaserWriter NT via the computer's RS-232 port?

DISCUSSION -----

As of October 1990, our databases show nothing about printing PostScript  
from an Amiga. Depending on your application software (or interfacing  
drivers), you have two choices:

- Connect serially to the LaserWriter and use its built-in PostScript.
- Set the LaserWriter to Diablo 630 emulation and print to it as if the  
LaserWriter were a "dumb" printer.

The Diablo 630 mode is a no-frills, daisy-wheel emulation, so if you have  
an application that doesn't mind if you strip out control codes, you'll  
be in business. The LaserWriter Owner's Guide has much more on this  
type of connection and interface capabilities.

AppleShare 2.0: Partitioning, Zones, and Restricted Log-In

=====

Article Created: 19 March 1991  
Article Reviewed Only:  
Article Last Updated:

TOPIC -----

I would like to restrict the total available space of a zone to that preset by a partition. Does AppleShare 2.0 let the hardware partitioning of the server hard drive correspond to the zones of the network?

Also, could I have multiple hard drives and assign each to a particular zone? Can LaserWriters be assigned and restricted to a zone?

DISCUSSION -----

AppleShare File Server recognizes hard-drive partitions, depending on how well-written the partitioning software is. There are probably some partitioning utilities that are not compatible with AppleShare. Contact the utility's vendor to make sure it works.

In the larger picture, you can't specify login privileges based on zone, but you can do the same thing by setting the privileges based on user ID. The login list is specified by volume, so you can give each volume a list of "good" users and by telling it to disallow "guest" log-ins. This will, in effect, do what you need.

AppleShare Print Spooler: No Demand-Based Routing

=====

Article Created: 21 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have an Apple IIGS lab that is configured with several teacher accounts, but without individual student accounts. During a particular session all the students log on with the same username, and are therefore attached to the same printer. Can the AppleShare print spooler be configured to capture input from all the GS computers and spool it to two or more ImageWriters?

DISCUSSION -----

As of October, 1990, there was no spooler that could intelligently divert output to different printers, based on the number of jobs in each queue for each printer (nor even simply divide all output in half and send each half to a different printer). Our databases don't show a product that can do this, nor can the AppleShare Print Server do it. All of the products listed have a one-to-one spooling capability, and the user has to change the spooled device manually.

Depending on your software and user configuration, you may want to try splitting the users into two groups. Instead of having everyone log on with the same username, make two usernames and have each print to a different printer. You can put each username into a single group and set the access privileges at the group level to keep everything the same.

## AppleShare: Troubleshooting PrintShare Problems

Revised: 8/13/91  
Security: Everyone

AppleShare: Troubleshooting PrintShare Problems

=====

Article Created: 22 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

We have set up an AppleShare network with PrintShare running. We have had frequent system bombs on the server. Although we made some changes, and things seem to go well for a while, system bombs recur.

In addition, we get lots of error sheets from PrintShare. Many of them have to do with "stack underflow". This situation occurs frequently on another AppleShare network, but without the crashes.

Our server is a Macintosh SE/30 with 4MB of RAM and an external 80MB hard disk running System 6.0.5, AppleShare 2.0.1, and PrintShare 2.0. We partitioned the disks with SilverLining Software (for a password-protected partition).

Our network includes three volumes on the server. The network contains about 15 workstations, three older LaserWriters (captured by the PrintServer), and three ImageWriters.

All workstations are Macintosh Plus computers. They run System 6.0.5, Laser drivers v. 5.0, the Virex INIT for virus checks, and no unusual INITs, DAs, or cDEVs.

DISCUSSION -----

Three things come to mind. First, make sure that the LaserWriter driver used by everyone (including the server itself) is at least version 5.2. Versions 5.0 and 5.1 have some known bugs which could contribute to the problems.

Second, make sure that NO extra INITs or cDEVs are running on the server.

Given the way AppleShare works, these extra INITs can cause a performance decrease and occasional system bombs. AppleShare is too time-sensitive to tolerate much interruption.

Third, everything could come down to a defective SCSI driver written to the hard drive. Make sure that you use the very latest version of SilverLining and reformat the drive. Make sure that backups are file-by-file rather than partition-by-partition, as any slight mistake in partition size may cause lots of problems during the restore operation. After formatting, re-install the File and Print Servers from diskette, rather than from the backup.

TOPIC -----

What determines the order that items appear in the Chooser's scrolling fields?

DISCUSSION -----

The Chooser broadcasts a signal to the entire network (or zone, if applicable) requesting that all devices of DEVICETYPE respond with their network information. The order in which those devices respond determines their order in the selection list. (A lightly-loaded network almost always returns the devices in the same order, because the devices aren't too busy to respond to the Chooser immediately.)

The order in which zone names are listed depends on the router you're using. Because this information is usual not dynamically compiled, most routers sort the list alphabetically for readability.

## A/UX and Macintosh Display Card 8•24 GC (4/94)

Revised: 4/1/94  
Security: Everyone

A/UX and Macintosh Display Card 8•24 GC (4/94)

Article Created: 26 March 1991  
Article Reviewed/Updated: 1 April 1994

TOPIC -----

What versions of A/UX support the Macintosh Display Card 8•24 GC?

DISCUSSION -----

The Macintosh Display Card 8•24 GC works with A/UX 2.0 through the current release as of this writing. However, acceleration cannot be enabled on the card, it will behave as an 8•24 card.

The QuickDraw acceleration features of the Macintosh Display Card 8•24 GC may or may not be supported in future releases of A/UX. Therefore, customers should not be expecting A/UX to support the card fully in the future.

## Mouse Paint for the Apple IIf Plus

Revised: 8/14/91  
Security: Everyone

Mouse Paint for the Apple IIf Plus

=====

Article Created: 19 March 1991  
Article Reviewed Only:  
Article Last Updated:

TOPIC -----

Is it possible to copy the Mouse Paint drawing program from a 5.25-inch disk (p/n 680-3005-B) onto a 3.5-inch disk for the Apple IIf Plus. If so, what is the procedure?

DISCUSSION -----

It is possible. First, copy file-by-file everything from the 5.25-inch disk to the 3.5-inch disk. Then, make sure that the name of 3.5-inch disk matches the original 5.25-inch disk.

The program expects to find itself only on disks with that particular name, and it assumes that its files are in exact places. If you don't change the name or move the files, you'll be fine.

You can use the Apple System Utilities diskette, which should come with every Apple 3.5 and 5.25 Drive accessory kit to copy the files. There are a variety of third-party disk utilities available that can also do this. Check the Redgate Buyer's Guide library on AppleLink for possible solutions.

DuoDisk Drive: How to Use It with Apple IIGS

=====

Article Created: 18 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I want to connect a DuoDisk Drive to an Apple IIGS. How is this done, and how will it affect my 3.5-inch drive and 5.25-inch drives?

DISCUSSION -----

The DuoDisk usually acts like two Apple 5.25-inch drives. There are a couple of compatibility issues, however:

- If you plan to attach the DuoDisk to the SmartPort on the back of the Apple IIGS, and it is going to be the last device in the chain, then you need to make sure the DuoDisk's analog board has a particular modification. If it lacks this modification, you can do it yourself. Details can be found in both "Tech Procedures for the DuoDisk" and the Product Notices section of the "Apple Service Programs" binder.
- If you have a newer IIGS, with rev 03 ROMs and 1MB of RAM installed on the logic board, you CANNOT attach the DuoDisk to the SmartPort at all: you must use a DuoDisk interface card, just as if the IIGS were an Apple IIe instead. You can buy this through Service (part number 661-92131).

If you meet these two considerations, the DuoDisk will not affect your other attached disk drives.

Finder: "file could not be written and was skipped" Message

=====

Article Created: 19 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

When copying a file from one disk to another, I got the message:

    This file could not be written and was skipped

The original file seems to open and work fine.

DISCUSSION -----

Here are two possible reasons for this:

This error indicates that your destination volume has a problem with it. If it is a floppy, reformat it. If it is a hard disk, run a good disk utility against it to discover the problem. Then take appropriate action.

The problem could also lie within the file or application. Examples such as a damaged or copy-protected file or application may also cause this message to occur. Make sure you are using a clean copy. You may want recopy from the original source to make the file is undamaged.

## Personal LaserWriter NT: 4MB SIMMs

Revised: 8/13/91  
Security: Everyone

Personal LaserWriter NT: 4MB SIMMs

=====

Article Created: 19 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Are the 4MB SIMMs for the Personal LaserWriter NT the same as those in the general market?

DISCUSSION -----

The requirements for the 4MB SIMMs are the same as for standard Macintosh II SIMMs, but they must be rated at 100ns or faster. They must also fit in a significantly smaller space than is allowed by the Macintosh II family. This eliminates 4MB SIMMs made from lots of 1MB DRAM chips.

A number of vendors advertise compatible 4MB SIMMs. Just check the ads in your favorite Macintosh-oriented magazine, or check with an Authorized Apple Dealer.

## Macintosh IICx: Mouse Failure and Memory

Revised: 7/14/92  
Security: Everyone

Macintosh IICx: Mouse Failure and Memory

=====  
Article Created: 19 March 1991  
Article Reviewed Only: 10 July 1992  
Article Last Updated:

TOPIC -----

I have a Macintosh IICx with memory expanded to 8MB (four 80ns and four 120ns chips). When I put the 120ns in bank A and the 80ns in bank B, I got an error chime on startup. I swapped the two banks and was able to use the system. Now, I am finding that when I do memory-intensive operations, my mouse freezes. My debugger points to the memory as the problem.

Is my configuration correct--four 80ns 1MB SIMMs in bank A and four 120ns 1MB SIMMs in bank B? Does the speed of the SIMMs determine which bank they go into? Might I have a flawed SIMM? Is the mouse freezing a symptom of reaching the memory limit (that 8MB may still not be enough for my purposes)?

DISCUSSION -----

You wouldn't normally experience a problem using these SIMMs in the IICx. All of them are at least as fast as the specifications require, and you're not mixing them within a bank (which, technically, is supposed to work, but often does not).

It sounds more like you have a defective SIMM, probably one of the 120ns. The self-test does not check the RAM as extensively as our diagnostics check it. It will try to make sure the lower addresses are good, which are the SIMMs in bank A, so the operating system will work correctly. Because it erred with the 120ns SIMMs in bank A, I would suspect those SIMMs first.

Mouse-freezing can be caused by a variety of things. Basically, mouse movement is controlled by the operating system, completely aside from all other system events. All mouse movements are posted to an event queue, as

are almost all other events, and then the events are processed in order of their occurrence. If a mouse freezes, then the event queue is not being processed. This means the operating system is hung within an event, because the operating system is either within an event or getting the next event.

One such event that causes the system to hang is faulty RAM refreshing or memory I/O, but the most common is disk I/O. In this case, however, we think you're dealing with a RAM problem.

## 80-Column Text Cards: Apple II & II Plus Compatibility (11/96)

Revised: 11/18/96  
Security: Everyone

80-Column Text Cards: Apple II & II Plus Compatibility (11/96)

=====

Article Created: 19 April 1991  
Article Reviewed/Updated: 14 November 1996

TOPIC -----

Does the Extended 80-column card work in the Apple II or Apple II Plus? If not, is there any way to upgrade an Apple II or Apple II Plus to 80-Column?

DISCUSSION -----

The 80-Column Card and Extended 80-Column Card work only in the Apple IIe; they cannot be used in any other computer.

Our databases do not show an 80-column interface for the Apple II or Apple II Plus. There were once several on the market, but the demand for this type of card has almost disappeared. You might still be able to find these 80-column cards through some of the computer remarketing companies, or where use computer equipment is sold.

An alternative is to purchase an Apple IIe or Apple IIGS computer. You need to to contact computer remarketing companies, or look where use computer equipment is sold.

Macintosh: Internal Hard Drives Not Always Interchangeable

=====

Article Created: 21 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have a Macintosh IIfx with an 80MB drive. I also have a Macintosh IIsi with a 40MB drive. I want the 80MB in the IIsi and the 40MB in the IIfx. Can I swap these drives? How about swapping drives between a Macintosh SE and a Macintosh IIsi?

DISCUSSION -----

No. In one direction (IIfx to IIsi), the hard drive is too large. In the other direction (IIsi to IIfx), there's no way to mount the hard drive in the box. Your best bet is to get an external drive for the Macintosh IIsi.

There are also physical size and mounting bracket problems with swapping drives between a Macintosh SE and a Macintosh IIsi.

Security: Everyone

Apple IIe: Memory and the Power Supply

=====

Article Created: 18 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I was about to install additional memory in my Apple IIe when a friend told me that any memory over 128K would cause my transformer to burn out prematurely. He advised me replace it with a more durable model. Is there any truth to this?

DISCUSSION -----

Memory, by itself, is not going to cause the Apple IIe power supply a problem. You should be able to install as many memory boards as the computer supports.

Some third-party power-supply manufacturers say that a fully-loaded Apple IIe (one with every interface slot filled) draws too much power and that you should install a higher-capacity power supply. However, we have not found that to be the case. Instances of supposed excessive power drain can usually be attributed to a damaged logic board, power supply, or interface card. A fully functional unit should not need a power supply upgrade.

ImageWriter II: How to Set Line Length from an Apple IIGS

=====

Article Created: 18 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Is there a way, when writing a BASIC program on the Apple IIGS, to send a command string to an ImageWriter II printer (like Control-i 40N) to limit the number of characters that the ImageWriter prints on a line?

DISCUSSION -----

You cannot set that limit within the ImageWriter, but you can set it within the IIGS's serial port firmware. In fact, it's the command you cited above. The ImageWriter prints until it physically reaches the end of the platen. So, if you need a guaranteed way to force a premature carriage return, set the serial port's firmware.

## ImageWriter II: Worn Spring Affects Print Quality

Revised: 8/13/91  
Security: Everyone

ImageWriter II: Worn Spring Affects Print Quality

=====

Article Created: 20 March 1991  
Article Reviewed Only:  
Article Last Updated:

TOPIC -----

I have seen numerous ImageWriter II printers with this problem: once or twice in a page (during test print) the printing gets very light for a word or two, and then goes back to normal. Sometimes ribbon quality is blamed, but other times a new ribbon changes nothing.

I had one on which I changed the wire and gears that drive the ribbon, and it still did it. Moving the carriage back and forth by hand and holding the ribbon-advance knob with light pressure shows that sometimes the knob stops spinning briefly, as if the wire were sliding on the pulley. However, everything looks physically okay.

DISCUSSION -----

The most common cause for the ribbon to stop spinning intermittently is a worn spring: the spring that maintains constant tension on the nylon wire that drives the ribbon-drive gear assembly. If the spring is worn, the constantly-varying tension within the ribbon cartridge (transmitted to the gear assembly), causes the nylon wire to slip.

Try replacing either the Ribbon Wire/Spring assembly (service part number 935-0001) or the spring only (available as a part of the Miscellaneous Hardware Kit, part number 076-0317).

## LaserWriter: Connecting to a Macintosh via Serial Cable (2/97)

Revised: 2/27/97  
Security: Everyone

LaserWriter: Connecting to a Macintosh via Serial Cable (2/97)

=====

Article Created: 20 March 1991  
Article Reviewed/Updated: 27 February 1997

TOPIC -----

If a user has a single Macintosh and a LaserWriter, is it necessary to connect the two using LocalTalk connectors, or would a serial connection like the Peripheral 8 cable work? Would there be any drawbacks to this?

DISCUSSION -----

It is possible to connect a Macintosh to a LaserWriter and print using a serial cable, though there are drawbacks and only a few LaserWriters are officially supported serially. The serial port on LaserWriters manufactured after the original LaserWriter is normally used for LocalTalk and can be identified by its mini-circular 8 port.

Here is a partial list of LaserWriter printers Apple fully supports using a Peripheral 8 serial cable.

LaserWriter Pro 600  
LaserWriter Pro 630  
LaserWriter Pro 810  
LaserWriter Select 300  
LaserWriter Select 310 (This print only supports a Macintosh serial cable)  
LaserWriter Select 360  
Personal LaserWriter LS  
Personal LaserWriter 300  
LaserWriter 4/600 PS  
LaserWriter 16/600 PS  
LaserWriter 12/640 PS\*  
Color LaserWriter 12/600 PS  
Color LaserWriter 12/660 PS

\* - To change the printer name or toggle the startup page, you cannot use a serial cable. Instead a Ethernet or LocalTalk connection is needed.

Almost every Apple PostScript LaserWriter printer manufactured after 1995 can use a serial cable. Consult your LaserWriter User's Guide, it contains connection instructions. If your LaserWriter printer supports serial printing, instructions are provided.

The one drawback to a serial connection on LaserWriter printers designed for LocalTalk is that you lose access to other network services since the LocalTalk port is being used by the serial cable.

NOTE:

Reference the User's Guide for correct printer port settings. You may have to change the pushwheel number or the dip switches.

The finished goods part number for the Peripheral 8 serial cable is M0197, the service part number is 590-0522.

Article Change History:

27 Feb 1997 - Added note about 12/640.

02 Dec 1996 - Updated to include additional printers.

25 Jul 1994 - Clarified what printers are supported.

LaserWriter and IBM PS/2: False "out of paper" Message

=====

Article Created: 20 March 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have tried connecting an IBM PS/2 to a LaserWriter IINT. After following the directions in the manual (with the corrected "8" instead of "7") I got an error message on the PS/2--"printer out of paper"--although there was some in the paper tray. Where is the problem?

DISCUSSION -----

The MS-DOS COM drivers scan for a particular signal on the RS-232 port for the paper-out condition. Given that, you're probably experiencing some type of cable problem. Most likely, you're missing a jumper on the PS/2 side. Check the DSR or CTS pins.

Also, the LaserWriter IINTX revised manual has about 25 pages of comprehensive details on connecting LaserWriters to IBM-compatibles. Check that for further troubleshooting.

Macintosh IIci: Configuring for Speed with Display Card 8•24 GC

=====

Article Created: 19 April 1991  
Article Last Reviewed: 9 June 1992  
Article Last Updated:

TOPIC -----

What is the fastest configuration for a Macintosh IIci using the Macintosh Display Card 8•24 GC and a RasterOps ColorBoard 264 with an Apple Portrait Display Monitor in 2-bit black and white and the Apple 13-inch RGB monitor in 24-bit color? I have the Portrait Display Monitor on the 8•24 GC and the RGB monitor on the RasterOps card. Should I be using the IIci's internal video circuitry?

DISCUSSION -----

There are three considerations here:

- You always have better performance using a NuBus video card than using the IIci's built-in video.
- The Macintosh Display Card 8•24 GC speeds up all QuickDraw processing, as long as it's active and as long as the "other" video board lets it. Check with RasterOps to see what their card does.
- You get more for your money when you put the greater pixel-depth monitor on the faster card, probably the Macintosh Display Card 8•24 GC.

LocalTalk PC Card: How to Free Memory to Print

Article Created: 21 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

We installed a LocalTalk PC card on a 386 AT clone with 1MB RAM. We use this PC to download stock quotations. The company uses Macintosh SE/30 and IIci systems for everything else. We want the 386 AT to print its stock data to the LaserWriter IINT.

When we try this, we get a message saying we don't have enough memory. We are running MS-DOS, LocalTalk PC software, and the program for the financial service. How can we print reports to the LaserWriter?

DISCUSSION -----

There are several ways to minimize the RAM allocations in an MS-DOS machine, which may free up enough space to run all of the applications at once. You may try reducing the number of buffers allocated to DOS, for instance.

If you configure AppleShare PC for print services only, you can expect it to take up 62K to 90K of base RAM. Because AppleShare PC must reside in the 0K to 640K range, you may free enough RAM for everything, if you can configure other portions of the operating system to run in the 640K to 1MB range.

We advise you to minimize existing RAM allocations first and re-install AppleShare PC with the minimum services. Then, if that doesn't work, start moving applications into higher memory.

Security: Everyone

AppleShare Network: Auto-Logon Problem

=====  
Article Created: 21 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have one and sometimes two Macintosh computers on my AppleShare network that have been giving me some problems. When these systems are turned on in the morning, they automatically ask for a password, so they can log on to the net. Some mornings, however, they come up and bypass the logon screen and start up without even going to the server.

To remedy this, I go to the Chooser, select AppleShare, and redefine what it is that I want saved for the next time the machine starts. Then, it works fine for quite a while. The network is okay, because there are machines before and after these machines on the net. I have rebuilt the system (6.0.3), re-installed AppleShare numerous times, and so on.

DISCUSSION -----

Automatic logon to an AppleShare server is done through two pieces of software: The AppleShare file itself (the RDEV that appears in the Chooser and is also an INIT) and the AppleShare Prep file, which stores the auto-logon information (volume name, password, and so on).

If the machines fail to log on (but AppleShare is active) you can manually mount the volumes without rebooting--then the most likely problem is that the RDEV can't find the AppleShare Prep file during startup. This could be due to either corrupt System software or a corrupt directory structure. Because you've already rebuilt the System, it's probably the latter.

Run Disk First Aid against the hard drive. This does minor repairs on the directory. You may also want to rebuild the Desktop. A definite cure would be to back up and reformat the hard drives, but you will probably be able to solve your problem without resorting to this.

TOPIC -----

How do I set a device to a different baud rate on a Macintosh serial port?

DISCUSSION -----

The ability to set the baud rate for the Macintosh serial port lies with the application and/or serial port driver you're using. In most instances, the baud rate is predetermined and cannot be changed. The most notable exception is modem communication, where you can set baud from within the application. There is no default (or built-in) method for setting baud.

We would suggest contacting the driver's publisher for this type of information, because it varies from driver to driver.

## Apple MIDI Manager: Compatibility & Availability (10/95)

Revised: 10/25/95  
Security: Everyone

Apple MIDI Manager: Compatibility & Availability (10/95)

=====

Article Created: 21 April 1991  
Article Reviewed/Updated: 25 October 1995

TOPIC -----

Does Apple sell a software program called MIDI Manager?

DISCUSSION -----

The Apple MIDI Manager is a developer's tool, not a stand-alone application or utility. It is available as part of the downloadable file MIDI Management 2.0.2 available from online services.

The following files are included in MIDI Management Tools 2.0.2:

- Apple MIDI Driver 2.0.2
- MIDI Manager 2.0.2
- PatchBay Help
- PatchBay 2.0.1
- PatchBay DA 2.0.1
- Serial Switch 1.1

The Apple MIDI Manager version 2.0.2 is compatible with System 7.5 but is not supported by Apple because it is considered a development tool.

Neither QuickTime 2.0 or 2.1 have MIDI Manager built-in, but they do have MIDI capability.

The QuickTime 2.0 Software Developers Kit which is available from APDA has information on how to take advantage of the Apple MIDI Manager.

These articles can help you locate the MIDI Management 2.0.2 software mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple

software updates.

- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Article Change History:

25 Oct 1995 - Added information about online availablility.

Article Last Updated:

TOPIC -----

I want to ship a LaserWriter IINTX (purchased in the USA) to Israel. Are there any kits that convert the LaserWriter to 220VAC?

DISCUSSION -----

There isn't a kit for the LaserWriter II to convert it to accept 220VAC. Further, the individual parts that need to be replaced (DC Power Supply, AC Power Supply, and Fuser Assembly) are not available for purchase in the United States.

You have two options available: Either buy and use a stepdown transformer (rated at 1300 Watts) or buy the parts overseas. The transformer is better, because then you can use the printer anywhere you take the transformer.

Article Last Reviewed: 14 May 1992  
Article Last Updated: 14 May 1992

TOPIC -----

Are there sets of four 800K disks of System Software 6.0.7 for people without 1.4 MB SuperDrives?

DISCUSSION -----

Yes. You can still obtain System 6.0.x on 800K disks through any authorized dealer. Macintosh System Software 6.0.8 is the latest version of System 6.0.x, and it is available on either 800K or 1.4 MB (high-density) floppy disks. Remember that the files on these disks are organized in a special manner. You cannot simply take the two high-density disks containing 6.0.8 and spread the files randomly to four 800K disks. This will not work. You must have the System Software version 6.0.8 disks that are intended for the 800K format. These are labeled "System Tools," "Printing Tools," "Utilities 1" and "Utilities 2."

## Macintosh: Network Fax Modems (9/93)

Revised: 9/2/93  
Security: Everyone

Macintosh: Network Fax Modems (9/93)

=====

Article Created: 18 April 1991  
Article Reviewed/Updated: 2 September 1993

TOPIC -----

Is there a network fax modem for the Macintosh?

DISCUSSION -----

There are three products that may serve your needs.  
These include:

- Xecom's QuadPort Network Modem family
- Ricoh's DX-1
- Microsoft's FaxGate

QuadPort Network Modem Family from Xecom

-----

These are four channel NuBus data and fax/data modem server products for the Macintosh II family.

The QuadPort Network server product line provides centralized, high-density, telecommunications resources inside a Macintosh II computer. Users can share as many as 24 modems or fax/data modems in AppleTalk, EtherTalk, or TokenTalk network environments.

DX-1 from Ricoh

-----

Ricoh's DX-1 lets Macintosh and many laptop computers communicate with local and remote Group 3 fax machines. Under it, a local fax machine can serve as a computer printer and scanner.

When DX-1 software runs from a computer on a network, users can transmit faxes from computer to computer on the network, without the use of fax boards or fax modems. It can serve as a fax traffic director at a hub unit, automatically saving received documents to

disk or switching them to a local fax for printing or storage in fax memory.

#### FaxGate from Microsoft

-----  
With FaxGate and BackFax, a single fax modem and phone line can serve the fax needs of all users on a Microsoft Mail or QuickMail network. Memos prepared with either LAN-based mail system can be routed to recipients at fax machines around the world in addition to, or instead of, recipients on the local network.

Note: BackFax software is no longer available. Fax Pro for Macintosh from Delrina Technologies replaces BackFax.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

#### Article Change History:

19 June 1992 - Reviewed for technical accuracy.

21 October 1992 Revised to say that FaxGate software is supported by Microsoft, not Solutions, Inc.

2 September 1993 - Added note that BackFax isn't available.

Macintosh: How to Access Novell Servers

=====  
Article Created: 20 March 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Can I use a Macintosh as a server within our Novell system? Would it permit mail both within the Novell and external to other AppleTalk nodes? Would MS-DOS machines encounter problems sending or receiving this type of mail? Would I need any special changes or hardware, other than a Macintosh as a server?

DISCUSSION -----

You can do this type of configuration, but with a different server: you need a Novell server with the Macintosh computers getting access from it (as opposed to a Macintosh server).

Novell sells a connectivity solution called "NetWare for the Mac" that lets a Macintosh access a Novell server in much the same way as Macintoshes access an AppleShare server. There are some limitations, like requiring Ethernet cabling at the server end, but it is a good solution.

For further information, search the Tech Info Library under "NetWare" and "Macintosh" to get the relevant articles. There is a three-part article that fully explains the configurations, along with related material.

## Laser Printers: Non-Apple Models and Driver Problems

Revised: 8/21/91  
Security: Everyone

Laser Printers: Non-Apple Models and Driver Problems

=====  
Article Created: 26 March 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have a question about PostScript LaserWriter clones, in particular the ones by GCC, QMS, and Hewlett-Packard. All of these promise AppleTalk ports and true PostScript. The QMS printer even comes with Apple's LaserWriter drivers. What are the possible disadvantages to these non-Apple printers?

DISCUSSION -----

Most of the problems originate with the software drivers, because the hardware is sitting off by itself with only the LocalTalk connection as a compatibility factor. Because LocalTalk is well documented, you won't find too many problems there.

The drivers are the biggest concern, because developers write their applications assuming that a printer driver will adhere to a certain set of protocols. In addition, the driver needs to interact with the system software. That implies yet another set of standard protocols.

## AppleShare Print Server: Storing Outline Fonts

Revised: 7/23/93  
Security: Everyone

AppleShare Print Server: Storing Outline Fonts

=====

Article Created: 26 March 1991  
Article Reviewed/Updated: 22 July 1993

TOPIC -----

I have a Macintosh II and a Macintosh IIfx. From them, I print to a Linotype RIP30 and a LaserWriter IINTX. I put numerous outline fonts in the System folder of each Macintosh to give each full-font capability.

Is there a way to store all of the outline fonts at the server, instead of on each Macintosh? If there isn't, could I attach a hard drive to the LaserWriter II? Could I also attach a hard drive to the RIP30?

DISCUSSION -----

Although it seems reasonable at first glance, you cannot install fonts on the Print Server for everyone to use.

The Print Server acts more like a "dumb" printer than anything else. That is, it looks like an Apple printer with LocalTalk functions only. It knows nothing of any special capabilities the printer may have, beyond what the LaserWriter or ImageWriter drivers tell it. Because of this, the Print Server doesn't have the ability to store any PostScript fonts.

You can install a hard drive on the LaserWriter IINTX to get the same effect. As for the Linotype printer, see your Linotype-Hell representative.

Security: Everyone

PrintMonitor: "found an internal problem" Error

=====

Article Created: 21 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

When I try to print from any of several applications the PrintMonitor becomes active and returns the following error message

PrintMonitor found an internal problem Where=-6; Why=-37

Without the PrintMonitor running, the system prints fine. LaserWriter and Laser Prep are installed from 6.0.5 with AppleShare V2.01.

DISCUSSION -----

That type of error suggests that PrintMonitor has found an incorrect filename (or variable name) during execution. There are several things that could cause it. Here are some things to try:

- Start the system. Throw away the Spool Folder that's in the System Folder. Restart the system, and rebuild the Desktop (hold down the Option and Command keys all the way through the startup process, and OK the dialog box that appears).
- Recopy ONLY the PrintMonitor application from the Printing Tools diskette.
- After backing up your installed fonts and desk accessories, trash the System file from the hard drive, and run the Installer to put a new operating system on the machine. It's important that the System be trashed. The Installer will not necessarily remove a corrupted resource, so you may have the same problems after installing.

## System 6.0.5: Can't print in MultiFinder

Revised: 8/21/91  
Security: Everyone

System 6.0.5: Can't print in MultiFinder

=====

Article Created: 22 March 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

My Macintosh IICx prints in Finder to a LaserWriter IINTX, but doesn't print in MultiFinder. Instead, I get the dialog message

a printmonitor error has occurred

I have checked cabling, reformatted the hard drive, and reinstalled System 6.0.5 (thinking I might have a virus problem). Nothing worked.

DISCUSSION -----

Because everything seems to work fine in the Finder, the hardware and most of the software is probably good. There are two more System resources that are pulled in when printing in the background under MultiFinder: Backgrounder and PrintMonitor. You may be experiencing a version incompatibility between these files. This is likely if you've recently upgraded your operating system.

We suggest replacing both of these files from a known-good 6.0.5 Printing Tools diskette. You can drag-copy them, but make sure you've booted your hard drive in Finder-only first. If you have a Spool folder in your System folder, throw that away too.

If that fails, try trashing and reinstalling the complete operating system using the Installer.

## LaserWriter IINTX: 3.0 ROM Upgrade

Revised: 8/22/91  
Security: Everyone

LaserWriter IINTX: 3.0 ROM Upgrade

Article Created: 18 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

What is the availability of the 3.0 ROM Upgrade for the LaserWriter IINTX?  
If so, when will it be available, and what does it do for you when  
installed?

DISCUSSION -----

Here's a rundown of the LaserWriter IINTX ROM 3.0 capabilities:

There is a new version of LaserWriter IINTX ROMs being rolled into production  
in late May 1991. These ROMs contain an updated version of PostScript.  
PostScript version 51.8 has the following enhancements:

- Full support of software switching between emulations and ports. You can switch into and out of an emulation mode via software.
- Improved support of multiple SCSI disks. You can connect as many as eight SCSI hard disks to the LaserWriter IINTX SCSI port. Up to 80 percent of the hard disk with the lowest SCSI ID is used for font caching, with the remainder of that disk and all of any other connected hard disks used for downloaded fonts. Each hard disk is now formatted as a separate volume. Thus, you can move a disk (other than the startup disk) between systems without having to reformat.
- Improved HP LaserJet+ emulation. Four characters have been added that were left out of the original implementation of HP LaserJet+ emulation.
- Improved default settings for HP LaserJet+ bit map printing. Previously, bitmaps in HP LaserJet+ mode were interpreted at 7-bit, thereby ignoring a significant bit. The new ROMs default to 8-bit serial

communications.

These new ROMs are found in any LaserWriter IINTX with a part number ending in 6004/A. Apple's Finished Goods part number for the LaserWriter IINTX Upgrade Kit is M0445LL/A.

## LaserWriter: How Pages-per-Minute Is Calculated

Revised: 8/22/91  
Security: Everyone

LaserWriter: How Pages-per-Minute Is Calculated

=====

Article Created: 19 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

The LaserWriter IISC specs indicate a speed of eight pages per minute. I am getting only five pages in about 4.5 minutes. The text is all one font and one size. Font sizes in multiples of four are installed in the system as suggested in the manual.

DISCUSSION -----

The specifications for all printers on the market are based on ideal conditions. In the case of Apple's laser printers, the assumption is that a page has already been downloaded and imaged by the I/O board. In other words, eight copies of a one-page document print in one minute, if you start the clock when the first page is picked out of the paper tray. An eight-page document prints slower, as each page must be downloaded and imaged before being put on paper.

Macintosh Display Card 8•24 GC: Acceleration Questions

Article Created: 19 April 1991  
Article Reviewed/Updated: 29 November 1995

TOPIC -----

- 1) Will the Macintosh Display Card 8•24 GC accelerate the internal video circuitry on the Macintosh IIci?
- 2) Will the Macintosh Display Card 8•24 GC accelerate the Macintosh II Portrait Display Video Card?

DISCUSSION -----

1) Question: Will the Macintosh Display Card 8•24 GC accelerate the internal video circuitry on the Macintosh IIci?

Answer: No. The Macintosh Display Card 8•24 GC accelerates only NuBus video cards that use frame buffering for video images. This works even better if the other video card supports NuBus slave mode. The Macintosh IIci's video circuitry does not use NuBus, nor does it support frame buffering. It will not be accelerated, except possibly in some very complex, pixel-deep images. This would be due to the Display Card 8•24 GC's processor and modified 32-bit QuickDraw. It probably would go unnoticed.

2) Question: Will the Macintosh Display Card 8•24 GC accelerate the Macintosh II Portrait Display Video Card?

Answers: The Display Card 8•24 GC accelerates the Portrait Display Card, but the increased performance would be at the low end of the spectrum (5 versus 30 times increase). This is because the Portrait Display does not support the NuBus slave mode.

TOPIC -----

Do you have any tips on protecting Macintosh analog boards against electrical surges?

DISCUSSION -----

The usual techniques for protecting any computer product apply. Surges are the biggest cause of product failure.

Background

-----

Electrical power surges can and do occur in all environments. In some areas, they occur regularly. In some cities, the power is very stable, while in others, the power can cut off two or three times a day, if only for a second. Even within cities or neighborhoods, there are variations.

Other factors that contribute to power fluctuations and surges include:

- Quality of the building's wiring
- Number of electrical devices
- Overloaded circuits
- Circuitry and wiring design

All of the above have a bearing on how often a particular system is prone to sustaining damage from electrical surges or spikes, brownouts, or blackouts.

At times, you may encounter situations where power surges produced damage to a system connected to a surge protector. Unfortunately, not all surge protectors give the same amount of protection.

Systems protected with surge protection devices still may sustain varying degrees of damage (from a slow leak on a chip that caused intermittent failures for months, to an outright failure, to melted chips). For example, a lightning strike 2,000 miles away from your system may be able to electronically zap a system through the phone lines. In one known case, the surge carried through the modem, into the computer, damaging the logic board, disk-drive controller board, modem, and two peripheral cards.

Which surge protection device should you buy? How much protection does a device really provide? Can it protect your system in view of your particular environmental condition?

#### Surge Protector Selection Tips

-----

A single-line surge protector usually protects between hot and neutral wires. This provides minimal protection, which may be adequate for areas and environments that are very stable.

A three-line surge protector usually protects between:

- Hot and neutral wires
- Hot and ground wires
- Neutral and ground wires

This offers more comprehensive protection.

A three-line surge protector protects between:

- Hot and neutral wires
- Hot and ground wires
- Neutral and ground wires

and has a separate fuse for each line. This offers better protection than the previously mentioned devices.

Don't forget about surge protection to your phone line, if you have a modem connected!

Surges attack over four electrical pathways: hot, neutral, ground, and via phone lines. Protecting only one can leave you vulnerable to damage. On a single-fuse system, if a surge takes out the fuse, all three sources of protection are nullified. In a three-line surge protector with three fuses, if a spike or surge takes out the first fuse, or catches only the "leading edge" of a surge, the second circuit takes over to block or reroute the surge with the third circuit absorbing the remainder.

The effectiveness of three-line protectors also depends on the construction of the device. This includes the speed with which it works and the voltages it can handle, block, or absorb. Price alone is not a reliable indicator, and not everyone needs the same type of device.

There are far more sophisticated systems for surge protection than those mentioned here. These include systems providing emergency power backup, which can cost many hundreds and thousands of dollars. The type of protection your equipment requires must be examined on a case-by-case basis.

Getting Selection Help

-----

To determine your needs, see a qualified expert. Your electric company can conduct measurements to determine electrical activity. Have a consulting electrical engineer or electrician check your electrical environment to determine power loads and the necessary level of protection. Then, the consultant can advise you of appropriate surge-protection requirements.

## Macintosh: Resource Map is Bad Message

Revised: 8/22/91  
Security: Everyone

Macintosh: "Resource Map is Bad" Message

=====

Article Created: 26 March 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

While starting up my Macintosh SE, I saw the message "Resource Map is Bad."  
What does this mean? (Startup continued without further problems.)

DISCUSSION -----

The resource map is a template that interprets the resource forks in any  
file into something intelligent. The Macintosh OS generates ID bombs  
(between -192 and -199) if it finds a serious problem in the resource fork.

We suspect that the message was generated by another application or  
utility. If it happened only once, don't be alarmed. However, we suggest  
running a file verification utility against the hard drive and possibly  
backing it up (just in case).

Security: Everyone

PostScript: Common Causes of Errors

=====

Article Created: 26 March 1991  
Article Last Reviewed: 21 July 1992  
Article Last Updated:

TOPIC -----

I tried to send an ASCII PostScript file (originally created under an IBM-PC application) to the LaserWriter. I get a PostScript error when I try to print documents with tables and formulas. The error that appeared on the screen is:

```
%%[Error:undefined;Offending Command:F0]%%
```

I can print text-only files okay. What's the problem? What do you recommend for troubleshooting PostScript errors?

DISCUSSION -----

PostScript errors are usually generated by one of three things: a corrupt document, a bad printer driver, or a slight incompatibility between the version of PostScript in the printer and what the application thinks is there. Because you can print text without a problem, we suspect the latter of the three, particularly if you're printing to the original LaserWriter. To verify this, you may want to try to print to a newer printer, like a LaserWriter IINT.

If you're interested in getting deeper into Postscript troubleshooting, get some of the reference manuals on the subject. Adobe has books on the subject, as do other publishers. For more information, search on "Adobe" AND "3rd".

Article Created: 22 March 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Are there products that produce a slide directly (internally) from a computer's screen image?

DISCUSSION -----

There are several products available for the Macintosh that generate slides from screen images. Look into any of these:

- Still Light from American Liquid Light
- PhotoMetric SlideMaker from General Parametrics Corp.
- Bravo Computer Slide Maker (BCSM) from Polaroid Corp.
- SlideWriter from Agfa Compugraphic Division

For vendor contact information, search the Technical Info library under the company name.

Still Light from American Liquid Light

-----

Still Light is a digital film recorder that captures images and generates boardroom-quality 35mm slides, negatives, transparencies, or instant prints.

Drawing on up to 16.5 million colors, Still Light accepts PICT or PICT II files from popular Macintosh applications. Because of its batch processing capability, it can produce up to 36 images, unattended, without having to load the software where the files were created.

Still Light's standard features include the Still Light video graphics card, software, adapter cables, film recorder, 35mm camera back with

autowinder, instant film back for 3.25x4.25-inch print film, Polaroid Instant Film Processor and slide-mounting accessories. Optional features include a 4x5-inch film back, 8x10-inch film back, and 35mm motion picture back.

PhotoMetric SlideMaker from General Parametrics Corp.

-----

The PhotoMetric SlideMaker is a desktop film recorder for the production of boardroom-quality 35mm slides. Features include: 4K addressability; full-color online preview; automatic text kerning for typeset quality; shaded (gradated) backgrounds; and automatic film loading, advancing, and exposure calibration.

Users can automatically shoot a single image, a series of images, or multiple copies of one or more images with no adjustments or exposure settings. A wide variety of popular film types are supported.

Bravo Computer Slide Maker (BCSM) from Polaroid Corp.

-----

The Polaroid Bravo Computer Slide Maker (BCSM) is a digital film recorder capable of creating images with addressable resolutions of up to 8,000 lines. It has a palette of up to 16.7 million colors and produces both instant and conventionally processed boardroom-quality 35mm slides. Image resolution is software selectable.

The BCSM accepts Polaroid High Contrast PolaChrome instant color, Polaroid Presentation Chrome conventional, and other ISO 100 35mm slide films.

SlideWriter from Agfa Compugraphic Division

-----

SlideWriter is a high-quality 35mm slide maker for business presentations, graphic design, image recording, and so on. Features include very high-resolution 35mm slides (2,048 or 4,096 pixels per scan line), virtually unlimited colors selectable from a palette of 16 million colors, and fast recording.

## AppleShare Network: WDEF Infection and Remedy

Revised: 8/23/91  
Security: Everyone

AppleShare Network: WDEF Infection and Remedy

=====

Article Created: 26 March 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Our office has an AppleShare network with about 12 Macintosh nodes of varying configuration. The workstations are constantly going catatonic for about a minute at a time. They seem to be looking out onto the network for something (there's a network activity indicator under the Apple when this occurs), but all work is being done locally.

Almost any action can bring on the behavior. We're using a combination of LocalTalk and PhoneNet. Does this possibly sound like a problem with termination in the network cabling? I've used Inter•Poll to test performance, but can't locate any particular black hole on the net.

DISCUSSION -----

It sounds more like you're dealing with the WDEF virus. The virus tries to infect a mounted AppleShare volume but, because AppleShare doesn't use the Desktop file, everything comes to a halt while WDEF figures out what to do.

We suggest running a good anti-virus utility on all your Macintosh systems except the file server. Symantec's SAM version 1.5 or higher will catch WDEF. You will want to eradicate the virus from your server (you'll have to start up with a floppy), but you don't want to install an anti-virus INIT on it, so that it runs all the time. You really wouldn't be keeping the server clean, just slowing it down.

You can remove WDEF without an anti-virus utility by simply rebuilding the Desktops on every Macintosh on the network. But be aware that you probably have several infected floppy disks around, just waiting to reinfect your hard drives. Also, if you work at home, you should check those computers for infection.

## System 6.0.7: When It's Needed on Pre-LC Macintosh Models

Revised: 8/23/91  
Security: Everyone

System 6.0.7: When It's Needed on Pre-LC Macintosh Models

=====

Article Created: 19 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I just got a copy of System 6.0.7. I know it is for the Macintosh Classic, LC, and IIsi, but does Apple recommend it for the Macintosh IIfx and the other Macintosh computers?

DISCUSSION -----

System 6.0.7 is compatible with all Macintosh computers from the Macintosh Plus on up. The only time it is required on the older computers is if you're using an Extended Keyboard II (the one that comes with the Macintosh LC).

## MultiFinder: Why System Memory Fluctuates

Revised: 9/13/95  
Security: Everyone

MultiFinder: Why System Memory Fluctuates

=====

Article Created: 19 April 1991  
Article Reviewed/Updated: 13 September 1995

TOPIC -----

Why does the amount of memory used by the System constantly change under MultiFinder or System 7? In the "About This Macintosh..." window, the System size and Largest Unused Block size fluctuate.

DISCUSSION -----

This happens because of the event-driven operating system. As various events occur, the System may need to load or unload resources through RAM to take care of them. Because events happen all the time--even when the Macintosh seems to be idle--RAM allocation varies all the time.

You see this fluctuation under System 7 or MultiFinder and not under just the Finder (pre-System 7) because of the dynamic RAM allocation. Under Finder, all RAM allocation is fixed, whereas in MultiFinder and System 7 a given application or resource can request or free up RAM.

## Macintosh: WDEF Symptoms

Revised: 8/23/91  
Security: Everyone

Macintosh: WDEF Symptoms

=====

Article Created: 22 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I'm having the following problems under System Software 6.0.7:

- Repeated restarts when doing things (moving folders, files, and so on) on the desktop
- Flashing warning box with no text in the box
- System bomb with the error message "Address Error"

DISCUSSION -----

There aren't any known problems with System 6.0.7, and especially none like that. We suspect that you're dealing with either a defective logic board or possibly a virus. I would suggest checking for the virus first, as the symptoms are similar to WDEF's infection of a Macintosh IIfx.

## LaserWriter IINT: Serial Connection to Xenix

Revised: 7/1/91  
Security: Everyone

LaserWriter IINT: Serial Connection to Xenix

Article Created: 22 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have a Macintosh IICx and a LaserWriter IINT. I also have a Xenix network of four Sperry workstations. I am using a program called SCO Lyrinx. This program has drivers that enable it to print to a PostScript printer. I want to print from one of these workstations to the LaserWriter IINT occasionally. Can I do this with the LaserWriter set for serial communication? What cable would I need to do this (or what are the pin-outs for such a cable)?

DISCUSSION -----

This can be done serially; for a broad overview of the process, refer to Appendix of the LaserWriter Owner's Guide. Also check the Tech Info Library; search under "ibm" and "laserwriter".

There are two things to be aware after you get the other information. The first is that the manual is incorrect in stating that the LaserWriter requires 7 data bits; it should be 8.

Second, the easiest cable to make for this connection is as follows:

| DB-25 |   | LaserWriter |
|-------|---|-------------|
| 1     | - | 1           |
| 2     | - | 3           |
| 3     | - | 2           |
| 7     | - | 7           |

If you need hardware handshaking, add:

|   |   |    |
|---|---|----|
| 6 | - | 20 |
|---|---|----|

## MacDraw II: Correcting Sluggish Object Moves

Revised: 7/1/91  
Security: Everyone

MacDraw II: Correcting Sluggish Object Moves

=====

Article Created: 15 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Periodically, when I select the object and move the mouse to the desired location, MacDraw II takes several seconds to snap the object to the new location.

The problem exists even when the computer is not connected to a network. I have re-installed MacDraw II version 2.0 and also re-installed the System.

DISCUSSION -----

We haven't heard of this problem, but here are some diagnostic steps that may help:

- 1) Make sure no background processes are the cause. Remove INITs (screen dimmers, clocks, Sound Master, and the like).
- 2) Re-install the System software.
- 3) Try the same procedure on another system.
- 4) Check with Claris to see if they know of this situation.

## Macintosh: Troubleshooting ID=15 Segment Loader Error

Revised: 8/23/91  
Security: Everyone

Macintosh: Troubleshooting ID=15 Segment Loader Error

=====

Article Created: 15 April 1991  
Article Last Reviewed: 21 July 1992  
Article Last Updated:

TOPIC -----

I have frequent system errors on a Macintosh II with internal CMS hard disk running Quark Xpress 3.0, Illustrator 1.9.x, and Aldus Freehand. The most frequent and consistent error is a System Error ID=15 (Segment Loader Error). It most frequently occurs when launching Quark Xpress by double-clicking a Quark document, although it has happened while opening documents from Illustrator and Freehand. Most of the time, launching the application using the "Open" command seems to work okay.

DISCUSSION -----

It sounds like a software problem. What other files are in the System Folder? Try removing any added INITs (screen dimmers, sounds, mail, menu clocks, and the like). It may be that their software is fine, but when you combine this particular version of the system software with this particular version of Xpress you get a bomb. Make sure you are using a simple System Folder and the current versions of all the software.

Whenever you are troubleshooting a problem, always try to eliminate as many variables as possible. This would include eliminating third party hardware as well as any INITs or third party software that could affect the system folder.

Also, check with the software manufacturers for information on latest revisions, what version of the system should be used with what version of the application, and incompatibilities.

If problems continue after all software situations have been explored, look at hardware, particularly memory or memory management. The problem could be with RAM or the logic board.

## LaserWriter IINTX: offending command:font downloader Message

Revised: 8/23/91  
Security: Everyone

LaserWriter IINTX: "offending command:font downloader" Message

=====

Article Created: 18 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have a Macintosh IICx with System 6.0.2 on a network with a LaserWriter IINTX. The NTX has an Apple SCSI hard disk. This configuration worked fine with 5.2 LaserWriter drivers and the 4.0 font downloader. However, when I load the 6.0 drivers, it downloads only the Times font and displays the PostScript error:

Invalid printer, offending command:font downloader

Now, with 5.2 drivers re-installed, it continues to mess up.

DISCUSSION -----

This may or may not be the cause of your particular problem, but System 6.0.2 is not compatible with the Macintosh IICx. The minimum software version is System 6.0.3, and we recommend running the System 6.0.5.

This problem sounds most like system software and/or driver corruption. We suggest you do the following things:

- 1) Run the Find File desk accessory ensure you don't have multiple System Folders on your hard drive
- 2) Regardless of how many System Folders you have, throw them all away after saving copies of any third-party INITs or CDEVs that you haven't backed up.
- 3) Use the Installer to install new System software and LaserWriter drivers onto the hard drive. Make sure the operating system version is at least 6.0.3.

Apple Licenses MS-DOS Connectivity Products To Farallon

=====

Article Created: 27 April 1991  
Article Last Reviewed:  
Article Last Updated:

Apple has entered into an agreement with Farallon Computing, Inc., granting them a non-exclusive, worldwide license to use, modify, create, develop, and market products from the AppleShare PC software and the LocalTalk PC Card.

As a result of this agreement with Farallon, Apple has:

- Removed the AppleShare PC and LocalTalk PC products from its Finished Goods price lists in mid-March
- Transitioned to Farallon on April 1 the sales, service, and support for these products SOLD BY Farallon.

You should not have any difficulty distinguishing Apple's software and card from Farallon's, since products sold by Apple are stamped with an Apple logo, and products sold by Farallon have Farallon's trademark.

Farallon has renamed these products this way:

| Apple Product          | Farallon Product                  |
|------------------------|-----------------------------------|
| -----                  | -----                             |
| AppleShare PC software | PhoneNET Talk software            |
| LocalTalk PC Card      | PhoneNET Card PC • LocalTalk Card |

APPLE WILL CONTINUE TO PROVIDE SERVICE AND SUPPORT (INCLUDING MEDIA EXCHANGE) FOR APPLESHARE PC AND LOCALTALK PC PRODUCTS SOLD BY APPLE PRIOR TO APRIL 1, 1991. Service Providers should continue to service and support these products through Apple.

For more information, search on "Farallon".

Apple Scanner: Clarification to Page 121 of the Owner's Guide

=====

Article Created: 19 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I'm having trouble scanning according to the directions on page 120 and 121 in the Apple Scanner Owner's Guide. While the directions are clear on how to define two separate areas, it seems I can only select one composition for the whole page.

For example, following the instructions, I select the first area and choose the halftone composition. Then, using the Scan Area tool, I choose the second area and select the line art composition. If I click back on the first area, the composition is at line art, not halftone. If I click it back to halftone and go to the second area, the second area switches to halftone.

Does this feature really work using the AppleScan software? What am I doing wrong?

DISCUSSION -----

We set up the Apple Scanner and followed the directions on page 121. We got two images--one half-tone and one line art--on the screen at the same time. Be sure to select the arrow tool so that things get reset before selecting the scan area tool the second time. Then select the scan area tool and line art before scanning the document.

HyperCard: How To Do ASCII Character Sorting

=====

Article Created: 29 April 1991  
Article Last Reviewed: 5 June 1992  
Article Last Updated: 5 June 1992

TOPIC -----

I want to create a list in HyperCard that contains foreign characters (meaning characters with accent marks, and so on). I can't seem to get HyperCard to sort the characters correctly. Doesn't HyperCard use a standard ASCII table to sort characters?

DISCUSSION -----

HyperCard sorts text using the assigned ASCII values for each character. This means that ascending sorts put text symbols first, followed by numerals, then alphabetic characters last. A sort command that will work for you is:

"sort ascending text by expression"

where "expression" is any expression.

Macintosh: Problems with Large Startup Screens

=====

Article Created: 15 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Is there a startup screen size limit? I've created a 1MB startup screen for my Macintosh, but my system keeps hanging at startup.

DISCUSSION -----

There is no set startup screen limit, but you may be running out of RAM. Your limiting factors are available RAM and heap size. You need to have enough RAM to load your System file, Finder, any INITs or CDEVs, and any RAM cache that might be set in your control panel.

Another possibility could be your system heap needing resizing to accommodate such a large startup screen. Apple does not support changing the heap size, but there are several third-party utilities that do this.

For more information, search on "CE Software".

Macintosh: Startup Screen Color Shifts Caused by CLUT Matching

=====

Article Created: 15 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

When the startup screen on my Macintosh appears, it is first dark and then seems to lighten in tone. Why is this happening?

DISCUSSION -----

The changes to the display of your startup screen are caused by the color look-up table (CLUT). The Macintosh has many color combinations available. For example, on an 8-bit system, there is a choice of 256 colors out of 16 million possibilities. The computer stores a color look-up table for a startup screen graphic, and what you're noticing is the time it takes the Macintosh to match the graphic to the CLUT. During this matching, there is also a shift in the intensity of colors displayed in the graphic.

Apple Tape Backup: Workaround to Exact Size Volume Limitation

=====

Article Created: 15 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I'm unable to do a volume restore to a different size drive using the Apple Tape Backup 2.0.1. Is there any workaround to the exact size requirement of Apple's backup software?

DISCUSSION -----

The Apple Tape Backup does insist on restoring to a volume that's the exact size of the original.

There is a way around this (it works only if your backup is a volume backup). An INIT called Tape Disk comes with Tape Backup 2.0.1. Install this INIT into your System Folder and restart. Your tape will show up on the Desktop--just like a drive icon. You then simply drag over any files you want to the hard disk.

Security: Everyone

HyperCard IIGS: Release Information

=====

This article last reviewed: 22 February 1991

TOPIC -----

When is Apple going to release HyperCard for the Apple IIGS?

DISCUSSION -----

Apple announced HyperCard® IIGS® for the Apple IIGS® personal computer in December 1990. The program was made available in February 1991 through authorized Apple dealers in mid-February 1991. The program comes with nine ready-to-use stacks.

HyperCard IIGS has the full functionality of Macintosh HyperCard version 1.2.5--plus enhancements to improve performance and take advantage of the color capabilities built into the Apple IIGS. Users can also access the many stacks that already exist for the Macintosh, once developers convert them for the Apple IIGS.

To use HyperCard IIGS, you need an Apple IIGS with at least 1.5MB of RAM (2MB is recommended), system software 5.0.4 or later, one 800K disk drive, and a hard-disk drive (or connection to a network). HyperCard IIGS is sold only as a stand-alone kit with six program disks and three manuals.

Disk First Aid and MFS Volumes

=====

Article Created: 11 March 1991  
Article Last Reviewed: 8 October 1991  
Article Last Updated: 8 October 1991

### TOPIC -----

I'm trying to run Disk First Aid version 1.4.2 from a bootable floppy. When I run the program to analyze my hard disk it says "This is not an HFS disk" (and I think it is).

I'm doing this because Symantec said to run Disk First Aid before trying to defragment and optimize my hard disk before running "Disk TuneUp" on SUM II.

### DISCUSSION -----

We have seen this error only when trying to run Disk First Aid on an MFS-formatted volume. You can verify that the volume is HFS by looking at the left side of the two lines below the volume information when your disk window is open. There will be a pixel on the left side indicating that the volume is an HFS volume. The absence of a pixel means you have an MFS volume or you are running System 7.

If the volume is HFS, use a more current version of Disk First Aid--version 1.4.3 or above.

## System 6.0.5: Troubleshooting Mouse Problem

Revised: 7/14/92  
Security: Everyone

System 6.0.5: Troubleshooting Mouse Problem

Article Created: 11 March 1991  
Article Reviewed Only: 10 July 1992  
Article Last Updated:

### TOPIC -----

The pointer freezes in the left corner of the screen when I start my Macintosh IICx under System 6.0.5. If I start with System 6.0.3, the problem goes away.

### DISCUSSION -----

One problem with System 6.0.5 is that, if the connection is somewhat shaky, the system does not recognize the mouse after startup. If you run pre-6.0.5 System software, you can start the machine without the mouse, wait for it to complete the boot process, and then plug the mouse in. The system will recognize the mouse immediately.

We suggest that you try these diagnostic steps:

- 1) Verify the mouse connection to the keyboard or back of the machine.
- 2) Start the machine with the mouse plugged into the connector not currently in use.
- 3) If there is no difference, try throwing away the currently-installed System folder and reinstall a new copy, using the Installer.

Security: Everyone

PrintServer and AppleShare 2.01

=====  
Article Created: 11 March 1991  
Article Reviewed Only:  
Article Last Updated:

TOPIC -----

I am rebuilding an AppleShare network from scratch. I am upgrading many of the files that we had previously used. The file server seems to be working okay but there are a few problems. I have rebuilt with System 6.0.5 (we had previously used 6.0.3), AppleShare 2.01, and Printserver 2.0. The network is running on a Macintosh SE with 2.5MB RAM.

The network starts okay, but has crashed several times. I think most of these crashes are due to system incompatibilities or memory problems in the workstations. The workstations are mostly Macintosh SEs with 1MB. I expected some of the applications (like PixelPaint and Studio/8) to bomb, because of memory, but these have also caused the file server to crash. One user caused a crash by typing a new password. I thought this was due to system incompatibility (he's running 6.0.3 at present), but the documentation for 6.0.5 says it works fine in a network with other systems (specifically 6.0.2, 6.0.3, and 6.0.4).

The biggest problem I am having is with the PrintServer. I installed it, but when I load it and try to connect to a network printer, it times out. (I have tried both printers on the network with the same results. I have also re-installed PrintServer from another set of diskettes.) Then, when you choose to quit the application it bombs the system.

Do you know of any incompatibilities among System 6.0.5, AppleShare 2.01, and PrintServer 2.0? Are there any upgrades I might need? How about the RAM cache, now set for 1MB? Also, does AppleShare get upset with the file server running 6.0.5 and workstations running an earlier version?

DISCUSSION -----

We don't know of any incompatibilities with the system software and application versions you have listed. In fact, we run similar configurations with no difficulty.

The RAM cache is not changeable by the administrator on an AppleShare server. Rather, AppleShare dynamically allocates RAM to meet its needs. Don't change anything in the RAM cache.

We have two concerns with your configuration:

- Are all your users running the same version of the LaserWriter drivers?
- Was the System software installed using the Installer -- not drag copied?

It is very important that you run the Installer, because this is the only way to get the proper ROM patches loaded into the individual computer's System file.

With your Print Server, you mention that when you load it and try to "connect to a network printer", I have to assume that you are capturing a printer for print spooling services. If that is correct, and it times out, you may want to look at using the 6.0.1 LaserWriter and Laser Prep files as this timeout problem was addressed in those drivers. If you do use these drivers, make sure that all users upgrade and that there are no older drivers present in the network.

## 3270 Dial-In for the Macintosh: Use MacTerminal

Revised: 7/2/91  
Security: Everyone

3270 Dial-In for the Macintosh: Use MacTerminal

=====

This article last reviewed: 25 February 1991

TOPIC -----

Can my Macintosh dial in remotely to an IBM 3708 and get 3270 terminal emulation? Is there a Macintosh equivalent to FTTerm, a DOS product that does this on the IBM?

DISCUSSION -----

3270 emulation is available from the Macintosh side with MacTerminal. This is Apple's data communications product and should work just fine in this environment. You will need to verify with the network administrator that there is the capability in the host for remote dial-in support. If so, have it set up on the host and you should be in business.

## AppleShare File Server: When You Can't Throw Away Files

Revised: 8/26/91  
Security: Everyone

AppleShare File Server: When You Can't Throw Away Files

=====

This article last reviewed: 19 February 1991

TOPIC -----

When I'm logged on as the Administrator of my AppleShare server, the system locks up and bombs whenever I try to throw away folders with duplicate data in them. If I go to the file server and start up with an AppleShare Admin Disk, I can throw these folders away.

DISCUSSION -----

The locking up and bombing problem while throwing away folders could be caused by a couple of things. Try these steps:

1. Rebuild the desktop by holding down the Command and Option keys while the system is starting up from a floppy disk.
2. If the problem persists, reinstall the System and AppleShare software, as there may be some pointers to the Desktop and Finder that could be corrupted. This would explain why files can be thrown away when booted from a floppy.

## 3Com INIT and AppleTalk System File

Revised: 7/2/91  
Security: Everyone

3Com INIT and AppleTalk System File

=====

This article last reviewed: 15 July 1990

TOPIC -----

I have encountered a problem involving 3Com's 3+Mail, the 3+File, and the AppleTalk system file. It seems that 3Com or something is modifying the AppleTalk file so that the Macintosh bombs (usually ID 3). Throwing out the AppleTalk system file prevents the system crash, and my Macintosh seems to run just fine without the file.

What creates this file? What does it do? Why do I need it?

DISCUSSION -----

The file contains AppleTalk protocol updates. AppleTalk is found in ROM, but when an update is made to AppleTalk, these changes get put in a system file. This could happen if you're doing a number of system-related installations: 3Com, EtherTalk, System, etc.

The 3Com INIT is, unfortunately, not "smart" enough to say "I'm not on, EtherNet, so don't load yet." If you forget to disable the 3Com INIT and you boot with LocalTalk selected, you will get a bomb and have to boot from another disk to start up.

AppleWriter II: Transferring Files to a PC

=====

This article last reviewed: 19 February 1991

TOPIC -----

I want to transfer my ProDOS-based AppleWriter II files to WordStar 5.1 on my PC. Can AppleWriter II save files in an ASCII text format? If it does, can I use a standard communications package on my Apple IIe and PC and just run a cable between the two serial ports to transfer the data?

DISCUSSION -----

AppleWriter II saves files in ASCII format automatically. You can simply transfer your data to the PC using a serial cable and communications program.

## AppleShare Print Server: Using with Linotronic Printers

Revised: 7/2/91  
Security: Everyone

AppleShare Print Server: Using with Linotronic Printers

=====

This article last reviewed: 25 February 1991

TOPIC -----

Is it possible to use the AppleShare Print Server on a mixed network of printers, including Linotronic 1300s, Linotronic 100s, and LaserWriters?

DISCUSSION -----

There should be no problem with the LaserWriters, but the AppleShare Print Server doesn't support any of the Linotronic imagesetters, including spooling.

Check with Linotronic to see if they can recommend a spooler for you.

For more information, search on "Linotronic".

Security: Everyone

AppleShare: Using with CD-ROM Drive (8/95)

Article Created: 15 July 1991  
Article Reviewed/Updated: 22 August 1995

TOPIC -----

We have a CD-ROM drive that is connected to our file server as a server volume. There are times when we would like to use other CDs while the server is still running. Is there any way we can do this without having to shut down the server?

DISCUSSION -----

Apple recommends you upgrade to AppleShare 3.0.x, AppleShare 4.0.x, AppleShare 4.1, or AppleShare Pro (AWS 95). These versions of AppleShare have the feature of Continuous Parallel Data Structure (PDS) maintenance. This allows mounting and unmounting removable media (like CD-ROMs) while the server is running.

## AppleCD SC: Operating Temperature Without a Fan

Revised: 8/26/91  
Security: Everyone

AppleCD SC: Operating Temperature Without a Fan

=====

This article last reviewed: 15 July 1990

TOPIC -----

Concerning the AppleCD SC repair extension program:

A customer is concerned about the compact disks getting a bit warm to the touch now that the fan is disconnected. Is this normal? And if so, how warm can the player get?

DISCUSSION -----

It is true that the temperature of the unit rises without the cooling fan. We did a considerable amount of testing and found that the temperature remained lower than the 120°F needed to warp a CD. With the fan removed pay close attention to the unit's ventilation. DO NOT stack anything on top of the unit.

## DEC LQPO2 Daisy Wheel Printer: Pinouts for Macintosh

Revised: 7/2/91  
Security: Everyone

DEC LQPO2 Daisy Wheel Printer: Pinouts for Macintosh

=====

This article last reviewed: 19 February 1991

TOPIC -----

I'm trying to hook up a Digital LQP02 serial daisywheel printer to a Macintosh SE.

The pin-outs are:

| LQP02 Digital |                | Macintosh SE |      |
|---------------|----------------|--------------|------|
| Pin #         |                | Pin #        |      |
| 1             | shield         | 1            | HSKO |
| 2             | Tx data        | 2            | HSKi |
| 3             | Rx data        | 3            | TxD- |
| 6             | Data Set Ready | 4            | GND  |
| 7             | Signal ground  | 5            | RxD- |
| 20            | DTR            | 6            | TxD+ |
|               |                | 7            | GPi  |
|               |                | 8            | RxD+ |

Which pins goes to which connection?

I understand that the grounds go together. What about the shield? Do I really need it? The Tx goes to Rx, but the + and - TxD, RxD on the Macintosh side was a little confusing.

DISCUSSION -----

Use the negative TxD and RxD on the Macintosh side. Also, use the shield.

## Macintosh: Large Amounts of Clip Art

Revised: 8/27/91  
Security: Everyone

Macintosh: Large Amounts of Clip Art

=====

This article last reviewed: 15 July 1990

TOPIC -----

I'd like to have a single file with all my clip art in it so that I can quickly find and copy pictures to the Scrapbook. What program would be best at doing this?

DISCUSSION -----

There is no single right answer to your question. What application you should use depends on the file format of your graphics.

If you are using PostScript clip art, you'll need an application that works in PostScript, such as Adobe Illustrator or Aldus Freehand. If you are going to work with PICT documents, you'll need an application such as MacDraw II. If you are going to work with bit-mapped graphics, a program such as SuperPaint or MacPaint will suffice.

You may want to look for a program that is an art cataloger. These are generally used by people in the Graphics and Design section of desktop publishing who have large amounts of clip art that is commonly used.

Probably the best suggestion is to contact the company whose program you are using, and ask them what cataloger works best with their software or the respective type of clip art or graphic. An example would be to contact Adobe if you are using Illustrator, or Aldus if you are using Freehand.

## Hard Drives: Sticking at Startup (9/95)

Revised: 9/21/95  
Security: Everyone

Hard Drives: Sticking at Startup (9/95)

Article Created: 02 July 1990  
Article Review/Updated: 20 September 1995

TOPIC -----

I have an older Macintosh LC with an external 40 megabyte (MB) hard drive. Sometimes when I switch the external drive on, it won't start spinning. Tapping the side of the hard drive seems to break something loose inside, and the drive then starts spinning. The drive may work fine for a while, but the problem generally occurs again. Is there something wrong with my hard drive?

DISCUSSION -----

This is one of the most common hard drive failures. When a hard drive spins down, the read/write heads land on the platters. Hard drive manufacturers place some lubricant on the platters so that the heads don't scratch the platter surfaces when the drive is switched on again. Sometimes the lubricant actually functions as an adhesive and sticks the read/write heads to the platter. If the spindle motor can't overcome this adhesion, the hard drive will not spin up. The hard drive industry refers to this condition "stiction." A twist or a bump may free the heads temporarily, but the condition usually recurs. If you have a hard drive exhibiting these symptoms, back up any data that may not have been backed up, because the hard drive is not reliable. The repair is usually a drive replacement.

This is an industry-wide problem. Hard drive manufacturers are exploring alternate forms of lubrication and read/write head placement methods.

AppleFax Modem: When Wrong Size Letter Is Sent

=====

This article last reviewed: 19 February 1991

TOPIC -----

I have an AppleFax modem that always sends European letter-size faxes instead of regular letter-size.

I have re-done the setup three times, step-by-step, with no luck. Could this be a ROM problem?

DISCUSSION -----

It is possible that there is a ROM problem with your AppleFax Modem. There was a ROM upgrade for the AppleFax and you should order it.

If that still does not cure the problem and all your settings have been checked and verified, the logic board probably is the cause of the problem.

## Apple HD SC Setup: Checks for Bad Blocks & More (5/96)

Revised: 5/27/96  
Security: Everyone

Apple HD SC Setup: Checks for Bad Blocks & More (5/96)

Article Created: 15 July 1990  
Article Reviewed/Updated: 27 May 1996

TOPIC -----

Does the Apple HD SC Setup program re-map the hard disk to set aside bad or unusable sectors like a low-level format, or does it simply set up blocks and mark them all as available?

What other hard drive issues can it address?

DISCUSSION -----

Yes, Apple HD SC Setup does spare bad blocks. If too many bad blocks are found, a message that the hard drive needs to be serviced is displayed. Since you were apparently able to format the drive successfully, we can assume that the problems are not due to bad blocks.

The drive could be have other errors though. For instance, it could be having trouble positioning its head on the platters.

In very rare cases a third party formatter used on a Apple drive can damage it so that Apple HD SC Setup will no longer recognize it. The hardware is usually OK but the driver is severely corrupted. This was an issue with older version of Apple HD SC Setup and should not occur with the version shipping with System 7.5.

If you can prevent the driver from loading at start up. You can usually get Apple HD SC Setup to recognize and reformat the drive. To prevent the driver from loading, wait till the Mac has booted before turning on the drive. For internal drives, try holding down CMD-OPT-SHT-DELETE until the Mac has booted. (Note: This does not work on most Quadra, PowerBook, or LC series computers.

A good rule to follow is to format all SCSI devices with the same formatting software. This avoids possible SCSI driver conflicts.

With System 7.5, all 68040 based and higher Macintosh computers need to have SCSI Manager 4.3 compatible drivers.

You can also do a "Get Info" on problematic drive. In the Get Info window, next to where it says 'Where:' you will see "Hard Disk Name, SCSI 0" or "HardDiskName, SCSI 0 (a)" if it is an Apple HD SC Setup formatted drive. If any other information/characters are there, then it has a third party driver.

## Macintosh IIfx: Built-In Video Slows Performance Slightly

Revised: 7/10/92  
Security: Everyone

Macintosh IIfx: Built-In Video Slows Performance Slightly

=====

Article Created: 15 July 1990  
Article Last Reviewed: 10 July 1992  
Article Last Updated:

TOPIC -----

Does the Macintosh IIfx's built-in video port support all Apple monitors?

Does using built-in video, instead of a separate video card, slow the performance of the Macintosh IIfx?

DISCUSSION -----

The Macintosh IIfx's built-in video port supports the Apple High Resolution Monochrome, the Apple High Resolution RGB, and the Apple Portrait monitor. It does not support Apple's 2-page monitor.

Using the built-in video port instead of a card requires the computer to use its system memory for screen drawing, resulting in a loss of some performance. This can be minimized by using at least 5MB of RAM with the 1MB bank being located in bank A for video use.

## Apple IIGS: Using on AppleTalk Phase II Network

Revised: 7/2/91  
Security: Everyone

Apple IIGS: Using on AppleTalk Phase II Network

=====

This article last reviewed: 15 July 1990

TOPIC -----

I'm running an Apple IIGS, with GS/OS 5.02, on an AppleTalk LAN with a "II bootblocked" AppleShare server.

Can I upgrade this network to AppleTalk Phase II? I assume that if I do, my Apple IIGS computers will boot from a server in their own zone. What if I want to have two servers in one physical zone? Where will the Apple IIGS computers boot from?

DISCUSSION -----

AppleTalk Phase II has no effect on LocalTalk. The enhancements that Phase II provides are only for EtherNet and Token Ring

There was an upgrade to the boot blocks for loading GS/OS on the server. This is included with GS/OS 5.02 on a new Apple II setup disk.

The Apple IIGS will boot from the first server it finds.

## AppleShare & Apple IIGS: Cannot Load Descriptor File Error

Revised: 7/2/91  
Security: Everyone

AppleShare & Apple IIGS: "Cannot Load Descriptor File" Error

=====

This article last reviewed: 25 February 1991

TOPIC -----

I have a problem trying to install an Apple IIGS workstation on an AppleShare network.

On my Macintosh SE/30 file server, I've installed System 6.0.5, AppleShare, and Apple II network software. On my Apple IIGS, I made an "AppleShare on 3.5" startup disk, started it up, logged on, and installed Network Server Startup on the file server. After starting the Apple IIGS up from the network and setting the startup application to the Finder, I got the error message, "CANNOT LOAD DESCRIPTOR FILE \$0001." I've re-installed everything and the problem persists.

DISCUSSION -----

This sounds like an AppleShare server access privileges problem. Set the System Icons privileges to see files and folders for everyone and make sure that this change is made for all enclosed folders.

## AppleShare: Installing on Systems that Require System 6.0.4

Revised: 7/2/91  
Security: Everyone

AppleShare: Installing on Systems that Require System 6.0.4

=====

This article last reviewed: 19 February 1991

TOPIC -----

I recently purchased a Macintosh IIci as an AppleShare file server. My version of AppleShare File Server (2.0.1) is on an 800K diskette and cannot be used because it does not have System Software 6.0.4 on it. Is my only alternative copying the applications to a 1.4MB diskette that has System 6.0.4 on it?

DISCUSSION -----

In order for you to install AppleShare or some of our other networking and communications software on our newer computers, use the Network Products Installer diskette. This disk contains the latest System software and installer scripts as a pre-boot for the actual installer diskette. Just boot from the NPI disk, launch the particular Installer script, and the Installer will prompt you for the appropriate diskette.

The NPI diskette is currently shipping with all new systems that require System 6.0.4 or higher.

## Isolation Transformer: How It Protects You from Shock

Revised: 7/2/91  
Security: Everyone

Isolation Transformer: How It Protects You from Shock

=====

This article last reviewed: 25 February 1991

TOPIC -----

How does the isolation transformer protect a service technician from getting shocked?

DISCUSSION -----

The isolation transformer protects against a ground that's been reversed with a hot lead: for example, a normally grounded monitor frame that's been switched to hot. If you were to touch the frame and a true ground, you would be severely electrocuted.

The isolation transformer creates a floating source for the voltage that ties the voltage coming from the transformer to earth ground. This prevents you from getting between the power source and ground to complete a circuit.

## ADB Devices: Don't Connect/Disconnect while Computer Is On

Revised: 8/27/91  
Security: Everyone

ADB Devices: Don't Connect/Disconnect while Computer Is On

=====

This article last reviewed: 15 July 1990

TOPIC -----

I usually run my AppleShare servers without attached keyboards. When a keyboard is needed, I simply connect it. Recently, I've noticed that if the keyboard is plugged in after the machine is booted, the keyboard doesn't work. This problem seems to happen with newer machines and/or the newer versions of the system software.

DISCUSSION -----

The Apple Desktop Bus (ADB) was never intended to allow power-on configuration changes. This is a dangerous practice, as the ADB fuse is a soldered component on the logic board: if the fuse blows from connecting or disconnecting keyboards (or mice, trackballs, etc.) -- the logic board will need to be replaced. The owner's manuals have always made this clear.

## LaserWriter IINTX: Trouble Initializing Attached Hard Drive

Revised: 6/2/92  
Security: Everyone

LaserWriter IINTX: Trouble Initializing Attached Hard Drive

=====

Article Created: 15 July 1990  
Article Last Reviewed: 2 June 1992  
Article Last Updated: 2 June 1992

TOPIC -----

My LaserWriter IINTX is connected to an Apple 40SC Hard drive. My hard drive's SCSI ID is set to 5 and is properly terminated. When I attempt to initialize the hard disk using the LaserWriter Font Utility, the initialize button is always greyed out.

DISCUSSION -----

Be sure that you have:

- Connected the drive to the 50-pin SCSI connector instead of the DB-25 port serial connector on the I/O board.
- Not connected your computer to the same SCSI bus as the printer and the hard drive.
- Let the drive become ready before turning on the LaserWriter IINTX.

If all the above are correct, you may have a bad LaserWriter IINTX controller or hard drive mechanism.

## LaserWriter: Timeout Error Messages Printing Long Documents

Revised: 7/2/91  
Security: Everyone

LaserWriter: Timeout Error Messages Printing Long Documents

=====

This article last reviewed: 19 February 1991

TOPIC -----

When I try to print out long documents on my LaserWriter, I get a timeout error message. Someone suggested that I change the default values of my timeouts with a PostScript program. Where can I get such a program? What else can I do with it? Is one program better than another?

DISCUSSION -----

The new LaserWriter drivers (6.0.1 and later) are better at handling longer print jobs. If you are using older drivers, upgrade to the 6.0.1 versions as a first step.

The PostScript "program" you refer to is not an off-the-shelf commercial product. It's a PostScript code sequence that changes the default value of the timeout clock. We recommend looking at the PostScript Language Reference manual, published by Addison-Wesley. This book explains using PostScript commands to alter the timeout.

We recommend against sending PostScript commands to the LaserWriter, as it is quite possible to change the LaserWriter's parameters in such a way as to make the LaserWriter permanently inaccessible.

For more information, search on "Addison-Wesley".

AppleShare File Server: Cannot Be Bypassed at Startup

=====

This article last reviewed: 18 February 1991

TOPIC -----

Is there any way to prevent an AppleShare file server from starting up AppleShare that doesn't require using a separate system disk? Is there an option key sequence, for instance?

DISCUSSION -----

There is no hot key you can use to bypass AppleShare at startup. Using a separate system disk is the only way to prevent AppleShare from loading.

## Macintosh: Sad Mac Error Code Meaning (11/95)

Revised: 9/26/96  
Security: Everyone

Macintosh: "Sad Mac" Error Code Meaning (11/95)

Article Created: 2 July 1991  
Article Reviewed/Updated: 20 November 1995

TOPIC -----

When I turn on my Macintosh, I get a black screen with a "sad Macintosh" face and the numbers 020016. There is no listing for this error code in any of my manuals. What does it mean?

DISCUSSION -----

The particular error code that appears with the "sad Macintosh" is not as important as WHEN it occurs. If the Macintosh can start up from a different system diskette, then the problem is probably with the system software on the other disk. System problems are usually identified when you get a "happy Macintosh" face and the "Welcome to Macintosh" screen before the "sad Macintosh."

If the "sad Macintosh" face appears immediately at power up, that usually suggests an issue with the logic board or memory. Try starting up from a floppy disk before assuming it's a hardware problem.

Sad Mac Error Codes Description  
=====

On the Original ROMs (Macintosh 128k, 512k, 512ke, Plus):  
-----

When you press the interrupt button on the side of your Macintosh when starting up, you should get a sad Mac icon with '0F000D' and some bits cycling under the icon indicating it is performing a memory test.

This numeric code is in two parts:

- The first two characters are the class code. The class code tells what part of the diagnostic program found the error.
- The second four are the sub code. The sub class code tells what the error

was. In the case of a bad RAM chip, the sub class identifies the bad chip (this was very helpful to homegrown upgraders).

#### Begin\_Table

| Class Code                           | Sub Code             |
|--------------------------------------|----------------------|
| -----                                | -----                |
| 1 = ROM test failed                  | Meaningless          |
| 2 = Memory test - bus subtest        | identifies bad chips |
| 3 = Memory test - byte write         | identifies bad chips |
| 4 = Memory test - Mod3 test          | identifies bad chips |
| 5 = Memory test - address uniqueness | identifies bad chips |

#### Single Chip Identification

| Data Bit | Location | Sub Code Bits |
|----------|----------|---------------|
| -----    | -----    | -----         |
| 0        | F5       | 0001          |
| 1        | F6       | 0002          |
| 2        | F7       | 0004          |
| 3        | F8       | 0008          |
| 4        | F9       | 0010          |
| 5        | F10      | 0020          |
| 6        | F11      | 0040          |
| 7        | F12      | 0080          |
| 8        | G5       | 0100          |
| 9        | G6       | 0200          |
| 10       | G7       | 0400          |
| 11       | G8       | 0800          |
| 12       | G9       | 1000          |
| 13       | G10      | 2000          |
| 14       | G11      | 4000          |
| 15       | G12      | 8000          |

| Class Code    | Sub Code                                   |
|---------------|--------------------------------------------|
| -----         | -----                                      |
| F = Exception | 0001 Bus error                             |
|               | 0002 Address error                         |
|               | 0003 Illegal instruction                   |
|               | 0004 Zero divide                           |
|               | 0005 Check instruction                     |
|               | 0006 Traps instruction                     |
|               | 0007 Privilege violation                   |
|               | 0008 Trace                                 |
|               | 0009 Line 1010                             |
|               | 000A Line 1111                             |
|               | 000B Other exception                       |
|               | 000C Nothing                               |
|               | 000D NMI (normal indication)               |
|               | 0064 Couldn't Read System File into Memory |

Macintosh SE & Macintosh II ROMs:

-----  
The Sad Mac error codes have been changed to incorporate additional power for testing and to support the 32-bit world. Generally, the same codes are used for 68000 exceptions as the Macintosh, however they are displayed differently.

The traditional Macintosh error codes are displayed like this:

0F0003

Where "F" indicates an exception occurred, and "3" indicates an illegal instruction occurred. On the Macintosh SE and II, the display would appear:

0000000F  
00000003

\*Please note that 00000003 is a hex number.\*

The new power-on error codes have the following format:

XXXXYYYY  
ZZZZZZZZ

Where XXXX is internal test manager state information (ignore this), YYYY contains codes that indicate either an exception code, or the test number for a power on test failure. The ZZZZZZZZ code contains additional failure information to help track down the problem.

YYYY Error Codes:

-----  
\$0001 The ROM checksum test failed. Ignore the Z field.

\$0002 The first small chunk of RAM to be tested failed. The Z field indicates which RAM Bit(s) failed. This small chunk of RAM is always in Bank B.

Example: \$AABBCCDD  
AA=8 bit mask for bits 31-24  
BB=8 bit mask for bits 23-16  
CC=8 bit mask for bits 15-8  
DD=8 bit mask for bits 7-0

\$0003 The RAM test failed while testing bank B, after passing the chunk tested for code \$0002. The Z field indicates which bits failed as in code \$0002.

\$0004 The RAM test failed while testing bank A. The Z field indicates which bits failed as in code \$0002.

\$0005 The RAM External addressing test failed. The Z field indicates a failed address line.

\$0006 Unable to properly address the VIA1 chip. The Z field is not applicable.

## ..TIL07748-Macintosh-Sad\_Mac\_Error\_Code\_Meaning\_11-95.pdf

\$0007 Unable to properly address the VIA2 chip (Macintosh II only). The Z field is not applicable.

\$0008 Unable to properly access the Front Desk Bus. The Z field is not applicable.

\$0009 Unable to properly access the MMU. The Z field is not applicable.

\$000A Unable to properly access NuBus. The Z field is not applicable.

\$000B Unable to properly access the SCSI Chip. The Z field is not applicable.

\$000C Unable to properly access the IWM chip. The Z field is not applicable.

\$000D Unable to properly access the SCC Chip. The Z field is not applicable.

\$000E Failed Data Bus test. The Z field indicated the bad bit(s) as a 32-bit mask for bits 0-31. This may indicate either a bad SIMM or data bus failure.

\$000F Reserved for Macintosh compatibility.

\$FFxx A 680xx exception occurred during power on testing.  
The xx indicates the exception:

\$01 - Bus Error

\$02 - Address Error

\$03 - Illegal Instruction Error

\$04 - Zero Divide

\$05 - Check Instruction

\$06 - cpTrapCC, Trap CC, Trap V

\$07 - Privilege violation

\$08 - Trace

\$09 - Line A

\$0A - Line F

\$0B - unassigned

\$0C - CP protocol violation

\$0D - Format exception

\$0E - Spurious interrupt

\$0F - Trap 0-15 exception

\$10 - Interrupt Level 1

\$11 - Interrupt Level 2

\$12 - Interrupt Level 3

\$13 - Interrupt Level 4

\$14 - Interrupt Level 5

\$15 - Interrupt Level 6

\$16 - Interrupt Level 7

\$17 - FPCP bra or set on unordered condition

\$18 - FPCP inexact result

\$19 - FPCP divide by zero

\$1A - FPCP underflow

\$1B - FPCP operand error

\$1C - FPCP overflow

\$1D - FPCP signalling NAN

\$1E - PMMU configuration

\$1F - PMMU illegal operation

\$20 - PMMU access level violation

Macintosh Portable ROMs:

-----  
The bootup code in the Macintosh Portable contains a series of startup tests that are run to ensure that the fundamental operations of the machine are working properly. If any of those tests fail, a Sad Mac icon appears on the screen with a code below that describes what failure occurred. Here is a typical example of a Sad Mac display with an error code below it:

SAD MAC CODE

05460203     =     (D7.L)  
0000B6DB     =     (D6.L)

The two codes are actually the contents of the two CPU data registers D6 and D7. The upper word (upper 4 hex digits, in this case 0546) of D7 contains miscellaneous flags that are used by the start-up test routines and are unimportant to just about everybody except a few test engineers within Apple. The lower word of D7 is the major error code. The major error code identifies the general area the test routines were in when a failure occurred. D6 is the minor error and usually contains additional information about the failure, something like a failed bit mask.

SAD MAC CODE BROKEN DOWN

| Test Flags  | Major Error |
|-------------|-------------|
| -----       | -----       |
| 0546        | 0203        |
| Minor Error | Minor Error |
| -----       | -----       |
| 0000        | B6DB        |

The major error is further broken into the upper byte that contains the number of any 68000 exception that occurred (\$00 meaning that no exception occurred), and the lower byte that usually contains the test that was being run at the time of failure. If an unexpected exception occurred during a particular test, then the exception number is logically ORed into the major error code. This way both the exception that occurred as well as the test that was running can be decoded from the major error code:

SAD MAC CODE FURTHER BROKEN DOWN

| 68000 Exception | Test Code |
|-----------------|-----------|
| -----           | -----     |
| 02              | 03        |

In this example, the code says that an address error exception (\$0200) occurred during the RAM test for Bank A (\$03); \$0200 ORed with \$03 = \$0203.

Major Error Codes

-----  
Below is a brief description of the various test codes that might appear in the

major error code:

**\*\*Warning\*\*:** Some of these codes may mean slightly different things in Macintosh models other than the Macintosh Portable. These descriptions describe specifically how they are used in the Macintosh Portable.

- \$01 - ROM test failed. Minor error code is \$FFFF, means nothing.
- \$02 - RAM test failed. Minor error code indicates which RAM bits failed.
- \$05 - RAM external addressing test failed. Minor error code indicates a failed address line.
- \$06 - Unable to properly access the VIA 1 chip during VIA initialization. Minor error code not applicable.
- \$08 - Data bus test at location eight bytes off of top of memory failed. Minor error code indicates the bad bits as a 16-bit mask for bits 15-00.  
This may indicate either a bad RAM chip or data bus failure.
- \$0B - Unable to properly access the SCSI chip. Minor error code not applicable.
- \$0C - Unable to properly access the IWM (or SWIM) chip. Minor error code not applicable.
- \$0D - Not applicable to Macintosh Portable. Unable to properly access the SCC chip.  
Minor error code not applicable.
- \$0E - Data bus test at location \$0 failed. Minor error code indicates the bad bits as a 16-bit mask for bits 15-00. This may indicate either a bad RAM chip or data bus failure.
- \$10 - Video RAM test failed. Minor error code indicates which RAM bits failed.
- \$11 - Video RAM addressing test failed. Minor error code contains the following:

|                   |   |                         |
|-------------------|---|-------------------------|
| upper word        | = | failed address (16-bit) |
| msb of lower word | = | data written            |
| lsb of lower word | = | data read               |

Data value written also indicates which address line is being actively tested.
- \$12 - Deleted
- \$13 - Deleted
- \$14 - Power Manager processor was unable to turn on all the power to the board. This may have been due to a communication problem with the Power Manager. If so, the minor error code contains a Power Manager error code, explained in the next section.
- \$15 - Power Manager failed its self-test. Minor error code contains the following:

|     |   |                                                                               |
|-----|---|-------------------------------------------------------------------------------|
| msw | = | error status of transmission to power manager.                                |
| lsw | = | Power Manager self-test results (0 means it passed, non-zero means it failed) |
- \$16 - A failure occurred while trying to size and configure the RAM.  
Minor error code not applicable.

#### Minor error codes—Power Manager Processor Failures

-----

If a communication problem occurs during communication with the Power Manager, the following error codes will appear somewhere in the minor error code (usually in the lower half of the code, but not always):

|        |                                                             |
|--------|-------------------------------------------------------------|
| \$CD38 | Power Manager was never ready to start handshake.           |
| \$CD37 | Timed out waiting for reply to initial handshake.           |
| \$CD36 | During a send, Power Manager did not start a handshake.     |
| \$CD35 | During a send, Power Manager did not finish a handshake.    |
| \$CD34 | During a receive, Power Manager did not start a handshake.  |
| \$CD33 | During a receive, Power Manager did not finish a handshake. |

#### Diagnostic Code Summary

-----

Below is a summarized version of the Sad Mac error codes:

#### Test Codes

|      |                                                        |
|------|--------------------------------------------------------|
| \$01 | ROM checksum test.                                     |
| \$02 | RAM test.                                              |
| \$05 | RAM addressing test.                                   |
| \$06 | VIA 1 chip access.                                     |
| \$08 | Data bus test at top of memory.                        |
| \$0B | SCSI chip access.                                      |
| \$0C | IWM (or SWIM) chip access.                             |
| \$0D | Not applicable to Macintosh Portable. SCC chip access. |
| \$0E | Data bus test at location \$0.                         |
| \$10 | Video RAM test.                                        |
| \$11 | Video RAM addressing test.                             |
| \$14 | Power Manager board power on.                          |
| \$15 | Power Manager self-test.                               |
| \$16 | RAM sizing.                                            |

#### Power Manager Communication Error Codes

-----

|        |                                             |
|--------|---------------------------------------------|
| \$CD38 | Initial handshake.                          |
| \$CD37 | No reply to initial handshake.              |
| \$CD36 | During send, no start of a handshake.       |
| \$CD35 | During a send, no finish of a handshake.    |
| \$CD34 | During a receive, no start of a handshake.  |
| \$CD33 | During a receive, no finish of a handshake. |

#### CPU Exception Codes (as used by the startup tests)

-----

|        |                                      |
|--------|--------------------------------------|
| \$0100 | Bus error exception code             |
| \$0200 | Address error exception code         |
| \$0300 | Illegal error exception code         |
| \$0400 | Zero divide error exception code     |
| \$0500 | Check inst error exception code      |
| \$0600 | cpTrapcc,Trapcc,TrapV exception code |
| \$0700 | Privilege violation exception code   |

Apple High-Resolution Monitors: Using with Overhead Projectors

=====

Article Created:  
Article Last Reviewed: 15 July 1990  
Article Last Updated:

TOPIC -----

The barely visible, thin horizontal lines present on most Apple High-Resolution Monitor screens are causing problems for my LCD overhead projector. Are there any ways to reduce these practically invisible lines?

DISCUSSION -----

The horizontal line you're talking about is the Color Grid Stabilizing Wire; removing or altering it in any way would make your monitor much more fuzzy. Most overhead projectors don't go through the monitor, so the stabilizing wire shouldn't be a factor. If your projector does go through the monitor, you may want to replace it with one that connects directly to a video interface card instead.

Macintosh: Generic Pinouts for 9600 Baud V.32/V.42 Modems

=====  
  
Article Created: 18 February 1991  
Article Last Reviewed: 19 June 1992  
Article Last Updated:

TOPIC -----

What are the generic pinouts for connecting a Macintosh to a high-speed 9600 baud V.32/V.42 modem?

DISCUSSION -----

Here are the generic pinouts:

| Modem | Macintosh |
|-------|-----------|
| 1-7   | 4-8       |
| 2     | 3         |
| 3     | 5         |
| 5     | 2         |
| 4     | 1         |

These pinouts apply to all "V" series modems and all Macintosh computers. Older Macintosh computers have slightly different serial ports than the later machines and may not support the fastest possible Macintosh-to-modem speeds.

Article Last Reviewed: 15 May 1992  
Article Last Updated: 15 May 1992

TOPIC -----

How do you do a print screen from a Macintosh?

DISCUSSION -----

From System 7, first take a screen snapshot (Command-Shift-3), which creates a TeachText document of the current screen. Open the document (called "Picture 1" at the root level of the directory) by double-clicking on it and print from there.

From System 6 or earlier, press Command-Shift-4 while in 2-bit mode (black & white) and you will print directly to an ImageWriter. If the Caps Lock key is down, you will print the entire screen. If the Caps Lock key is up, you will print the active window. Direct LaserWriter screen dumps are not supported by the System software, but Command-Shift-3 (also while in 2-bit, black & white mode) will create a printable 72 dpi MacPaint document.

Macintosh: Mysterious Bombs May Be SCSI or RAM

=====

Article Created:  
Article Last Reviewed: 25 February 1991  
Article Last Updated:

TOPIC -----

I have a problem with my Macintosh bombing frequently at startup. My system also bombs at other times, such as when booting or quitting a program, but generally, most bombs occur at startup.

When opening DBase Mac, I get a message that the program has been corrupted. Open the program again and it runs fine. I get a variety of system errors such as ID-04, ID-01 and ID-25.

QuarkXPress 2.12 freezes on the screen while opening, yet an exact copy of QuarkXPress will install and run just fine on another Macintosh. Also, PageMaker 4.0 bombs when trying to "Place" a document or a graphic, as does Excel 2.2 when opening or closing.

I am using all standard Apple equipment, including an 80MB Quantum hard drive with a corrected EPROM and 5MB of RAM.

I have installed System 6.0.5 from the original Installer disks and have removed all INITs.

I have run Macintosh SE/30 diagnostics on the computer and Apple HD diagnostics on the hard drive--and all tests pass.

DISCUSSION -----

Even though your system has passed its diagnostics, you could still be experiencing a RAM or SCSI problem.

RAM problems can show up after warm-up. For example, a marginal SIMM's speed may be fine when cool but slow down after warming up. All SIMMs do

this to a certain extent, but you may have a SIMM that crosses the Macintosh SE/30's tolerance threshold when warm. The only fix for this is to replace the offending SIMM or SIMMs. A similar problem could be happening within the memory manager's circuitry on the logic board, the only possible fix being a complete logic board replacement.

More likely, this is a SCSI problem, particularly if you have external SCSI devices attached. We have seen this problem most often when there are external SCSI devices attached but not turned on. All SCSI devices must be powered on before starting the Macintosh and they must be left on until the Macintosh is turned off. Doing otherwise can introduce garbage onto the SCSI data line. Improper termination of the SCSI chain will also cause this problem.

If your SCSI chain is found to be the source of your problem, be aware that your hard drive's format may be corrupted (the garbage on the SCSI chain having corrupted the format). You'll need to reformat your hard drive with either all the external SCSI devices removed or powered on.

## Apple Scanner: Using with a Macintosh IIfx

Revised: 12/22/92  
Security: Everyone

Apple Scanner: Using with a Macintosh IIfx

Article Created: 2 July 1991

### Article Change History

-----  
12/22/92 - UPDATED

- To include Scanner driver 2.0 information.

### TOPIC -----

Is there any trick for getting an Apple Scanner to work with a Macintosh IIfx? I keep getting a "scanner not found" message. The Macintosh IIfx terminator is installed in the scanner's second SCSI port.

Do I need a second terminator when using with a Macintosh IIfx? Does it need to be an fx-type?

### DISCUSSION -----

The Macintosh IIfx is very picky about its termination. At no time should there be more than two terminators in the entire SCSI chain -- one on each end, or in the case of only one internal SCSI hard drive, a single terminator installed internally. All terminators used with the Macintosh IIfx must either be true IIfx-compatible or "augmented" by the IIfx SCSI Filter (used only with internal hard drives).

In addition, older Apple Scanners had some additional capacitors installed on the logic board, which may garble the SCSI signals when connected to faster Macintosh computers. Install the Scanner driver version 2.0 to correct this problem.

AppleShare: Requires Dedicated Server

=====

Article Created:  
Article Last Reviewed: 15 July 1990  
Article Last Updated:

TOPIC -----

If I had enough RAM, would it be possible to run AppleShare file and print servers on my Macintosh in the background under MultiFinder? I know that the instructions state that I need a dedicated machine, but I only need to use a few other programs.

DISCUSSION -----

Unfortunately, there is no way to make either the AppleShare File Server or Print Server run in the background under MultiFinder. The "administrative" portions of these systems can run concurrently under the server software, but that is not the same as running in the background. The actual code that drives the server software actually modifies the operation of the System to such an extent that most applications would be incompatible with it.

## Apple IIGS: How To Make a GS/OS 5.0.2 Diskette

Revised: 8/28/91  
Security: Everyone

Apple IIGS: How To Make a GS/OS 5.0.2 Diskette

=====

Article Created:  
Article Last Reviewed: 15 July 1990  
Article Last Updated:

TOPIC -----

I am trying to get my Apple IIGS to print AppleWorks 3.0 files on a LaserWriter over LocalTalk or local ImageWriter.

I started out with an AppleWorks 2.0 disk that worked just fine on my Apple IIGS (ROM v1.0). I copied the disk, then replaced my AppleWorks 2.0 files with AppleWorks 3.0 files. When I chose Chooser, the Apple IIGS went into what looked like machine language or Pascal code. I then tried using the old AppleWorks 2.0 disk and it did the same thing. I tried to configure a AppleWorks 3.0 disk with GS/OS 5.02 but I can't figure out what files are necessary to do this.

DISCUSSION -----

Your problems are caused by the setup differences between GS/OS 4.0 and 5.0.2. Here are the steps to make a bootable GS/OS 5.0.2 diskette that can print to a LaserWriter and/or ImageWriter:

- 1) Boot GS/OS 5.0.2; format a blank 800K diskette and called it "Startup".
- 2) Run the Installer program from the SYSTEM.TOOLS diskette, and install the option "AppleShare on 3.5" onto the Startup diskette.
- 3) Still within Installer, "Remove" the option called "AppleShare" from the Startup diskette.
- 4) Using Installer, install the LaserWriter and LocalTalk ImageWriter options onto the Startup diskette.

Hint: try to have two 3.5" drives--if you don't it may take you up to one

hour to do the above with only one floppy drive.

This will get you a bootable diskette that contains the absolute minimum operating system and the necessary printer drivers. From a hardware standpoint, make sure that slot 1 in the Apple IIGS control panel is set to "AppleTalk" and that you set AppleWorks to print to slot 1 -- the older Apple IIGS had a different control panel setting.

Note: you may not be able to fit both the operating system and AppleWorks onto a single diskette.

## AppleShare Print Server: Printing Too Many Copies Problem

Revised: 8/28/91  
Security: Everyone

AppleShare Print Server: Printing Too Many Copies Problem

=====

Article Created:  
Article Last Reviewed: 25 February 1991  
Article Last Updated:

TOPIC -----

Every time we send 15 or more pages to the AppleShare Print Spooler, the server automatically doubles or triples the total number of pages printed.

This problem happens no matter what kind of Macintosh we're using or what kind of document we are printing.

DISCUSSION -----

This problem is most likely occurring because the AppleShare Print Server is losing AppleTalk signal packets. In the middle of a print job, the server can sometimes "lose" its connection with the LaserWriter. When this happens, the server automatically resends the entire print job.

There are a couple of things you can do to alleviate this problem. First, be sure you're using at least LaserWriter driver 6.0.1. This version has optimized "answer-back" code for the LaserWriter that continually says "I'm here" to the print server during printing (which is what tells the server to maintain its connection). If your LaserWriter isn't doing that often enough you'll lose the connection.

Next, check for any devices that may be causing an excessive amount of network noise. The most time-consuming (but most reliable) way to do this is to make your network as small as possible (two or three devices). Then test for noise, adding devices until the problem is found. Using a network utility like Inter•Poll can help locate noisy devices. If you're using any routers in your network, try disconnecting them--the extra time required to route data packets may be contributing to the problem.

Macintosh: Troubleshooting a "System Error ID=01" Message

=====

This article last reviewed: 18 February 1991

TOPIC -----

My setup is a:

- Macintosh IIci; 80MB hard disk; 8MB RAM
- Radius TP color display
- Scanner
- External HD
- Tape Backup
- System Software 6.0.4

When I attempt to start up from the internal hard disk, a "System Error ID=01" message appears and the system will not start up. The system will start up from a disk copy of the System. Reinstalling the System to the internal HD has not worked.

DISCUSSION -----

ID=01 is a bus error.

First, use Find File or a similar tool to verify that there is only one System file on the hard drive. Next, remove all non-Apple files from the System folder and restart. If this does not fix the problem, you may have a hardware problem. Try a different hard drive first, and then try a different logic board.

The other thing that could be causing the problem is the video card for your Radius display. Try replacing the Radius with an Apple video card and monitor.

## Apple IIGS: Troubleshooting SCSI Problems

Revised: 7/2/91  
Security: Everyone

Apple IIGS: Troubleshooting SCSI Problems

=====

This article last reviewed: 15 July 1990

TOPIC -----

My Apple IIGS, with a High Speed SCSI Card installed, gets an error code #8002 when copying between SCSI hard drives. What does this error code mean?

DISCUSSION -----

Error code #8002 isn't part of the generic GS/OS 5.0.2 operating system. This suggests the error code is coming from the SCSI driver.

Most problems with the High Speed SCSI card come from improper installation of the SCSI drivers. Specifically, people often don't install the new drivers that come with the card using the original GS/OS SCSI drivers instead.

Here are some troubleshooting steps to try:

- 1) Create a new boot diskette that contains GS/OS 5.0.2 and the new SCSI drivers (the drivers are installed via the Installer program located on the High Speed SCSI Card Utility diskette).
- 2) Try to copy between SCSI devices after booting with this diskette.
- 3) If you can copy successfully, then reinstall the GS/OS onto your hard drive. Remember to reinstall the new SCSI drivers before rebooting from the hard drive.

Depending on the current state of the operating system already on the hard drive, you may have to trash the existing System and Icons folder.

## ImageWriter LQ: Accessories Needed for Handling Envelopes

Revised: 7/2/91  
Security: Everyone

ImageWriter LQ: Accessories Needed for Handling Envelopes

=====

This article last reviewed: 18 February 1991

TOPIC -----

I need help in handling the sheet feeder--expansion bin--envelope attachment setup for an ImageWriter LQ.

- 1) If I want to have the envelope attachment in place at all times and also want to use the cut sheet feeder, must I also have an expansion bin?
- 2) For the above setup (envelope attachment plus one expansion bin), is the correct DIP switch configuration the one described as "Two Bins Plus Envelope"?

DISCUSSION -----

- 1) In order for you to have the envelope attachment in place on the ImageWriter LQ, you'll need to have an expansion bin to hold the paper.
- 2) Yes, you are correct. The DIP switch setting for "Two Bins Plus Envelope" is the setting you should use.

## LaserWriter: Sharing Access Over Ethernet

Revised: 7/2/91  
Security: Everyone

LaserWriter: Sharing Access Over Ethernet

=====

This article last reviewed: 15 July 1990

TOPIC -----

I have an AppleShare network running over Ethernet. Can I share my LaserWriter IINT with everyone else on the network if it's connected to one of the workstations rather than the server?

DISCUSSION -----

Since the LaserWriter is a LocalTalk device, you can put it anywhere in the loop. But you will need to have some kind of router installed on the network to change the LocalTalk protocols to Ethernet protocols.

There are a couple of ways to do this:

- With a hardware router, such as the Kinetics Fastpath. This device would actually be a separate node on the network.
- With the Apple Internet Router. This is software that is installed on a single Macintosh that can connect to both types of networks. In your case, the most logical place to put it would be on the server, but that is not a strict requirement. The router runs in the background, but if you install it on a workstation, and that machine somehow is turned off (in a system crash, for example) then everyone will lose access to the LaserWriter.

For more information, search on "ROUTER AND ETHERNET"

## LaserWriter Plus: Running Out of Memory Problem

Revised: 3/18/92  
Security: Everyone

LaserWriter Plus: Running Out of Memory Problem

=====

Article Created: 15 July 1990  
Article Last Reviewed: 18 March 1992  
Article Last Updated: 18 March 1992

TOPIC -----

On my LaserWriter Plus, I'm printing a lot of non-LaserWriter fonts and graphics. I often get the error message that printing exceeds printer memory. How can I fix this?

DISCUSSION -----

The LaserWriter Plus comes with 1.5MB of RAM. Since the LaserWriter Plus cannot be expanded with more on-board RAM, your only recourse is to purchase (or upgrade) to a higher-end LaserWriter. The LaserWriter IINT has 2MB of RAM, and the LaserWriter IINTX has up to 12MB of RAM.

## Personal LaserWriter: Using Overseas

Revised: 8/29/91  
Security: Everyone

Personal LaserWriter: Using Overseas

=====

This article last reviewed: 15 July 1990

TOPIC -----

Is a step-down transformer required for using a Personal LaserWriter overseas? It appears that it does because on the back of the printer it states 100-115v at 50-60 Hertz. Also, why does the printer specification sheet give both US/Japan and European/Australian power requirements?

DISCUSSION -----

As with our other LaserWriter printers, there are voltage-specific versions available. There are actually two different Personal LaserWriters versions: one for the US/Japan market and the other for the European/Australian market.

You do need a step-down transformer if you take a Personal LaserWriter overseas, just as you would for any LaserWriter or LaserWriter II.

## PrintMonitor: Troubleshooting Quit Unexpectedly (3)

Revised: 7/2/91  
Security: Everyone

PrintMonitor: Troubleshooting "Quit Unexpectedly (3)"

=====

This article last reviewed: 15 July 1990

TOPIC -----

When printing to a LaserWriter in MultiFinder with Background Printing on, the PrintMonitor will either "Quit Unexpectedly(3)" or just not print.

The files I'm trying to print remain in the Spool Folder with the PrintMonitor appearing every 10 seconds to announce that it has "Quit Unexpectedly(3)". This keeps happening until PrintMonitor is removed from the System folder or the spool files are removed from the Spool folder.

Also, the PrintMonitor "Quits Unexpectedly(3)" when I double click on it.

DISCUSSION -----

Most often, applications unexpectedly quit because they ask for more memory than has been allocated to them, the Memory Manager says "no", and the application has no idea what to do next.

PrintMonitor, even though it looks like a standalone application, does not use the RAM allocated to it during the background printing process. Instead, PrintMonitor uses some of the RAM allocated to the Finder. If the Finder (in the background) is maintaining a lot of items, such as open windows, mounted file server volumes, and so on, there may not be enough RAM left over for PrintMonitor to work. Try allocating more memory to Finder, such as 320K (the default is 160K).

Another possible problem is a corrupted Backgrounder file, the INIT that handles the background task management. Since PrintMonitor is appearing periodically to check the Spool Folder, it's probable that Backgrounder is fine and you're seeing only a memory limitation.

And finally, there may be an INIT that is conflicting with PrintMonitor's operation. Removing all non-essential INITs and testing will tell you if

that's the problem.

## AppleShare Print Server: Capture and Release Questions

Revised: 8/29/91  
Security: Everyone

AppleShare Print Server: Capture and Release Questions

=====

Article Created:  
Article Last Reviewed: 19 February 1991  
Article Last Updated:

TOPIC -----

I have some questions on AppleShare Print Server:

- A) If a printer is "captured" for print service, can another user, who is not set up with the "captured" LaserWriter spooler in the Chooser, print to that printer directly or is that printer unavailable?
- B) It is not clear to me from reading the manual if the captured printer is always releaseable. What are the parameters for releasing a printer?
- C) We currently have five LaserWriters that we plan to capture for print service. In the next two months we plan to add two more printers. How will we be able to capture those printers for service on the network? Will we have to buy another AppleShare Print Server? If so, can we run two print servers on the same file server? How is this best accomplished?

DISCUSSION -----

Here are the answers to your questions:

- A) If you select Printing, Spooling, and Bypass in the Options dialog box, the captured printer can be printed or spooled to directly. Both options will be available to all users in their Choosers.
- B) A captured printer can always be released. To release a printer from the spooler:
  - 1. choose Setup from the File menu  
Printer Types box

3. select the particular printer you want to release
4. click the Release button.

C) The AppleShare print server can capture from one to five printers, depending on the amount of RAM available to the print server application. To capture more than 5 printers you will need a second print server system.

## AppleCD SC: Plays Music But Won't Read Data Problem

Revised: 8/29/91  
Security: Everyone

AppleCD SC: Plays Music But Won't Read Data Problem

=====

This article last reviewed: 15 July 1990

TOPIC -----

The CD Remote desk accesory on my Macintosh suddenly doesn't work anymore. I can play audio CDs just fine, but that's all.

The CD-ROM platter loads, the access light comes on, and the access light blinks once. Then the system freezes up. The AppleCD SC's eject button ejects the platter, and finally an alert box appears suggesting that the disk is not Macintosh formatted.

DISCUSSION -----

This is probably caused by an incompatible third-party INIT corrupting the System file. The CD-ROM driver v3.0.1 loads incorrectly and can't read data discs, though it still can play audio CDs.

Follow these repair steps:

- 1) Trash your old System, then reinstall a new System. Be sure there are no duplicate System folders on the hard drive before reinstalling.
- 2) Put only Apple INITs into the System folder; see if the AppleCD SC works.
- 3) One at a time, add your third-party INITs and CDEVs back into the System folder, testing after each addition. It's entirely possible that you'll get everything put back the way it was and the system will work--this would show that you had a corrupted System resoure file.

Macintosh IIci: Audio Port Electrical Specifications

=====

Article Created: 2 July 1991  
Article Last Reviewed: 10 July 1992  
Article Last Updated:

TOPIC -----

What is the impedance for the audio port of a Macintosh IIci?

DISCUSSION -----

According to the Apple Macintosh Family Hardware Reference manual:

"The external sound jack is at standard line level (approximately 1.5 volts peak-to-peak) and its source impedance is approximately 47 ohms. The jack is capable of driving a headphone load of 8 to 600 ohms, or the input to almost any audio amplifier or amplified speakers. It will not adequately drive a directly connected external speaker. The sound jack is short-circuit protected."

## SCSI: Using the SCSI ID Address #0

Revised: 7/2/91  
Security: Everyone

SCSI: Using the SCSI ID Address #0

=====

This article last reviewed: 25 February 1991

TOPIC -----

Can you clarify an issue concerning SCSI addresses? The Macintosh is always address #7. Internal hard drives are always address #0. For a Macintosh that doesn't have an internal hard drive, can its external drive use address #0? Is #0 reserved by the system? Is there some special significance associated with the #0 address?

DISCUSSION -----

The SCSI address #0 is a special address, but it is not absolutely reserved for system use. Not taking the Startup Device cDEV into account, if the Macintosh sees a storage device attached to it that has a SCSI ID of 0, then it will wait for that device to come up to speed to see if it is bootable. If it is bootable, the system will start up from that device. There is no other special significance attached to the #0 ID, so you can set an external device to it if you like.

Apple Tape Backup: Recovering Lost Data

=====

This article last reviewed: 19 February 1991

TOPIC -----

I backed up my system using Apple Tape Backup then accidentally backed up another smaller system on the same tape. Is there any way to recover the remaining data from the first backup?

DISCUSSION -----

Since the volume information of the tape is stored at the beginning of the tape, the original contents of the tape would have been lost when a new directory was written on the tape. Something you might try is to use the INIT Tape Disk that comes with the Tape Backup 40SC software. Mount the cartridge as a streaming device on the desktop, then attempt to use a recovery utility, such as SUM, to recover the lost files.

## Apple Internet Router: One Zone Per LocalTalk Port

Revised: 7/2/91  
Security: Everyone

Apple Internet Router: One Zone Per LocalTalk Port

=====

This article last reviewed: 15 July 1990

TOPIC -----

The beta version of the Internet Router supported four zones on two physical LocalTalk ports. According the documentation for the Internet Router version 2.0, and from several articles in the AppleLink Technical Info Library, it appears that one zone per physical LocalTalk Port is the new limit. Is this correct? If so, are there any solutions or workarounds?

DISCUSSION -----

Yes, that function was not implemented in the released version of the Apple Internet Router. To our knowledge the only way you can have more zones than physical ports is to add another interface card with a port on it.

Macintosh: SIMM Thickness Tolerances

=====

This article last reviewed: 15 July 1990

TOPIC -----

What are the upper and lower limits for Macintosh SIMMs? I know the official size is 1.27mm, but how much tolerance is there?

DISCUSSION -----

The 1.27mm thickness is Apple's specification. Thicker SIMM PCBs can bend the retaining springs out. This isn't a problem as long as thinner SIMMs are never inserted into the same sockets.

If thinner than 1.27mm SIMMs are used, the chance increases of having weak or impaired connections.

The main point to remember is that Apple's sockets are for 1.27mm SIMMs. If you buy SIMMs from Apple, you can be sure they're OK. If you buy from a third party, be sure to ask for SIMMs with the right thickness.

## ImageWriter II: Troubleshooting Garbled Printing

Revised: 9/3/91  
Security: Everyone

ImageWriter II: Troubleshooting Garbled Printing

=====

Article Created: 15 July 1990  
Article Last Reviewed: 30 August 1991  
Article Last Updated: 30 August 1991

TOPIC -----

The printing on my ImageWriter II has become garbled garbage. It's missing the page breaks and prints onto other pages. This happens after about 6 or 7 pages have printed. I've tried cleaning the platen and replacing main circuit board.

DISCUSSION -----

This sounds like a handshake problem in communication between the computer and the printer. It could be caused by a number of glitches, among them a bad driver, bad cable, or printing software.

Try to recreate the problem using:

- a different computer with the same application and file
- a different printer
- a different printer cable

## Macintosh Memory Allocation: Application Has Unexpectedly Quit

Revised: 2/2/93  
Security: Everyone

Macintosh Memory Allocation: "Application Has Unexpectedly Quit"

=====

Article Created: 15 July 1990

### Article Change History

-----

12/10/92 - REVISED

- To make the article more general rather than specific to PageMaker.

02/02/93 - REVISED

- To add more possible fixes to the list.

### TOPIC -----

I keep getting out of memory error messages when performing tasks in an application. I also get "Application has unexpectedly quit" error messages.

### DISCUSSION -----

This kind of error is usually caused by an application, INIT (Extension), or CDEV trying to grab more memory than it has been allocated.

Here are some fixes, depending on what's causing the problem:

- Allocate more memory to the application. Under System 6 Finder, applications could grab a lot more memory. Some manufacturers don't set the partition high enough to do certain operations in their programs. To increase the RAM allocation, change the "Application Memory Size" box in the Get Info dialog box for the application.
- Replace the application with a new copy. It may be that the application is corrupted.
- Allocate more memory to PrintMonitor. If you're seeing the error most often when printing, and you have background printing turned, try

allocating more RAM to PrintMonitor first. Then increase RAM for the application.

- Reduce the number of INITs (Extensions) and CDEVs running on the system. Remove all INITs (Extensions) that aren't a fundamental part of the system software or application. Some INITs use a large amount of memory.
- Try reinstalling the system software. Damaged or corrupted system files can cause this error as well.
- If running System 6, an alternate (unsupported) solution is to increase the amount of RAM allocated to the system heap using CE Software's HeapFixer.

Note: Altering the system heap can cause other, more unpredictable errors. Also note that if running System 7, the system heap is adjusted dynamically, and HeapFixer isn't necessary.

For more information, contact CE Software. (To locate a vendor's address and phone numbers, use the vendor name as a search string.)

- This would also be a good time to check for viruses. They can contribute to unusual system behavior.

## Macintosh LC: VRAM Memory Map Correction

Revised: 7/24/92  
Security: Everyone

Macintosh LC: VRAM Memory Map Correction

Article Created: 25 March 1991  
Article Last Reviewed: 23 July 1992  
Article Last Updated:

### TOPIC -----

The memory map in the "Macintosh LC Computer Developer Note" shows the VRAM space as \$FC 0000-\$FF FFFF. This gives 256K of memory. How does the 512K VRAM SIMM map into this smaller area?

### DISCUSSION -----

The "Macintosh LC Computer Developer Note" is wrong.

The memory spaced used by VRAM is in the following ranges:

| 24-bit mode            | 32-bit mode                |
|------------------------|----------------------------|
| -----                  | -----                      |
| \$F4 0000 to \$FB FFFF | \$50F4 0000 to \$50FB FFFF |

With the 512K VRAM SIMM installed, the entire range from \$F4 0000 to \$FB FFFF (24-bit mode) or \$50F4 0000 to \$50FB FFFF (32-bit mode) is used. (\$FB FFFF minus \$F4 0000 is \$07 FFFF, which equals 512K.)

With the 256K VRAM SIMM installed, the range from \$F4 0000 to \$F7 FFFF (24-bit mode) or \$50F4 0000 to \$50F7 FFFF (32-bit mode) is used; \$FB FFFF minus \$F7 0000 is \$03 FFFF, which equals 128K.

Note: The range from \$F8 0000 to \$FB FFFF (24-bit mode) or \$50F8 0000 to \$50FB FFFF (32-bit mode) maps to the range from \$F4 0000 to \$F7 FFFF (24-bit mode) or \$50F4 0000 to \$50F7 FFFF (32-bit mode). In other words, if a change is made to \$F8 0000, the same change will be made to \$F4 0000. The reverse holds true as well: a change to \$F4 0000 will reflect in \$F8 0000.

## LaserWriter IINT: Possible Reasons for Slow Printing

Revised: 8/12/91  
Security: Everyone

LaserWriter IINT: Possible Reasons for Slow Printing

=====

Article Created: 4 April 1991  
Article Reviewed Only:  
Article Last Updated:

TOPIC -----

I'm trying to print a MORE document with a SuperPaint picture. The last page of the document prints fine on a LaserWriter, but takes a long time on a LaserWriter IINT.

Is there a problem with the LaserWriter IINT?

DISCUSSION -----

There are several possible causes for slow printing on a LaserWriter IINT:

- There are too many fonts downloaded to the LaserWriter IINT's memory.
- There is an Apple II printing to the LaserWriter IINT. An Apple II slows down the LaserWriter IINT by downloading an ImageWriter emulator.
- There is a network problem causing the LaserWriter IINT to retry. Use Inter•Poll and send several thousand packets to the printer to see how many packets come back with errors. Too many errors suggests a bad cable or printer I/O board.

Apple IIe: Getting Screen Output to Printer

=====

Article Created: 2 April 1991  
Article Reviewed Only:  
Article Last Updated:

TOPIC -----

I'm using an Apple IIe with a Super Serial Card with an ImageWriter II. I want everything that appears on my computer screen (input and output) to go to my printer. Is this possible?

DISCUSSION -----

You cannot get both the input and output redirected to your printer unless you're using an application that specifically allows this. Another option is to write a BASIC program that echoes the screen input the printer.

## Macintosh: Meaning of the Desktop DB & Desktop DF Files (7/95)

Revised: 7/6/95  
Security: Everyone

Macintosh: Meaning of the Desktop DB & Desktop DF Files (7/95)

Article Created: 4 April 1991  
Article Reviewed/Updated: 06 Jul 1995

TOPIC -----

Why do I have these files on my Macintosh?:

- Desktop DB
- Desktop DF

DISCUSSION -----

The Desktop DB/Desktop DF files are invisible files that are not normally seen by users. The files were original created by the Desktop Manager of AppleShare 2.0 running under System 6.0.x to maintain information in addition to the Finder's Desktop file at that time. There were designed to be more high performance databases to support faster access to information for AppleShare servers.

Under System 7, functions of the Desktop Manager were incorporated into the Finder along with File Sharing support. The limits of the resource manager were being overextended by the old style resource-based Desktop file. The Finder database file was redesigned as a file storing information in the data fork in a faster and more efficient form.

The primary information stored in the Finder's Desktop DB/Desktop DF files is the mapping of icon display information for application and their associated files. This includes application signatures (creators) and associated file types. This information is used by the Finder to determine what application to launch when a file is double-clicked and to ascertain whether a file can be opened by a drag'n'drop action onto an application.

Other files with their own icon information also have their icon mappings stored in this database. Several flags associated with every file, such as whether the file is an alias or stationery file, whether the file name is locked from change, and whether the file is visible or not are maintained in

the database. Other information stored in these files includes Comments from Finder Get Info windows, position information of icons within Finder container windows, and the positioning of the Finder windows.

These are the files that are rebuilt by holding down the Command and Option keys during Finder startup.

More details about the Finder database can be found in Inside Macintosh:Macintosh Toolbox Essentials, chapter 7, Using the Finder Interface.

TOPIC -----

What is Apple's policy regarding VDTs, electromagnetic emissions, and health?

DISCUSSION -----

Apple Computer, Inc.  
Corporate Statement on Video Display Health Issues  
May 29, 1990

### Apple's Corporate Position

Apple Computer is committed to making products safe. That's why we meet or exceed every safety standard, not because we have to, but because we want to. Based on the prevailing opinion of the scientific community, Apple believes that computer monitors are safe. However, with any scientific issue there is a diversity of opinion. We are open-minded to new scientific evidence and in fact encourage research in this area.

### Apple's Monitoring Activity

Apple's products are constantly tested and compared against existing and proposed international standards. We continuously follow scientific developments in the field of computer health and safety. Members of Apple's Environmental Health and Safety group as well as representatives within Product Development, Product Marketing and Engineering Services keep track of new findings.

Apple is also a board member of the Center for Office Technology (contact is O. Bruce Dickerson 212-560-1298), a clearing house for more information

related to health issues and office automation equipment. In addition, Apple is currently setting up a program to sponsor dedicated academic research in the low-frequency radiation field.

#### Scientific Opinion

The low level of intensity of the fields emitted from VDTs is not considered harmful by the American Medical Association, the American College of Obstetricians and Gynecologists, the National Institute for Occupational Safety and Health and the World Health Organization, among others.

Recently, the issue of the possible effects of prolonged exposure to extremely low frequency electromagnetic emissions has been raised. The U.S. Environmental Protection Agency has said (see New York Times 5/23/90) that the evidence on the issue is so far inconclusive. The EPA's office of health and environmental assessment has suggested further study on the ELF issue. Apple also supports additional research so that we can continue to act responsibly, ensuring the health and safety of our customers and employees.

#### Question and Answers

- What is Apple's position on the VDT-emission health issue?

Apple is committed to making products as safe as can be. Based on the prevailing opinion of the scientific community Apple believes that televisions and computers are safe. However with any scientific issue there is a diversity of opinion. We are open-minded to new scientific evidence and in fact encourage it.

- What are the health concerns regarding VDTs?

A number of studies link intensive computer use to health problems such as musculoskeletal disorders, eyestrain, fatigue, and headaches. These problems are well understood and medical experts have suggested effective methods for preventing them.

There is also a growing public concern throughout the world about potential health risks related to the low-frequency electromagnetic fields emitted by VDTs and other electric products, which all operate at the AC line frequency of 50 and 60 Hz such as electric blankets, televisions, and power lines.

Although most scientists and computer experts maintain that low-frequency electromagnetic emissions are harmless, others assert that not enough is known to say with certainty that they are safe. Most everyone agrees that more research is necessary before any conclusions can be made.

- What are the government regulations for VDT emissions?

X-ray emissions are strictly regulated by international law. In the US,

this law is administered by the FDA's Dept. of Health and Human Services. All Apple displays are designed and tested to emit well below the level permitted.

Radio frequency emissions can interfere with radio and TV transmissions and are also regulated internationally. In the US, limits are mandated by the Federal Communications Commission.

In Sweden government-industry cooperatives have set limits for VLF radiation from VDTs. These limits do not appear to be based on data from health studies, but rather are based on general, achievable guidelines for reducing emissions.

No government regulations exist in any country limiting ELF emissions.

- What is Apple doing to follow and participate in research in the VDT health field?

Apple's products are constantly tested and compared against existing and proposed international standards.

We continuously follow scientific developments in the field of VDT health and safety. Members of Apple's Environmental Health and Safety group as well as representatives within Product Development, Product Marketing and Engineering Services keep track of new findings.

Apple is a board member of the Center for Office Technology, a clearinghouse for information related to health issues and office automation equipment.

In addition, Apple is currently setting up a program to sponsor dedicated academic research in the low-frequency emissions field.

- How does Apple respond to increasing government legislative activity concerning VDT's?

We welcome government's inquiry into the safety of VDT's, and support the adoption of standards once generally agreed upon limits and a testing methodology emerge from research.

#### Product Issues

- Will Apple take steps to lower VLF and ELF emissions in its products?

Based on the prevailing opinion of the scientific community, we do not believe it is necessary to lower the ELF emissions of our computer monitors. In fact, scientific research so far has not been able to establish guidelines for emission levels. However Apple is closely following the issue so that we may continue to ensure the health and safety of our customers and employees.

- How might this radiation be reduced?

Currently emissions can be reduced through a combination of circuit board design, component selection, field cancellation coils, metallic shielding and surface coatings.

- Will you comment on IBM's announcement to lower emissions in its monitors?

IBM announced it will offer monitors which feature reduced VLF emissions. (See Wall Street Journal 11/22/89) They have clearly positioned these products as a response to market demand, rather than to health and safety concern. IBM's products are not currently shielded for ELF radiation.

- What are the levels of ELF and VLF emissions by Apple's VDTs?

Apple feels that it would be inappropriate to make these figures public because there is currently no standardized testing methodology or established guidelines by which to make comparisons.

- What is Apple's comment on the MacWorld article?

Regarding the Article: The MacWorld article calls for industry to address the VDT emission issue. Apple encourages further research on low-frequency emissions.

- Regarding the Measurements:

We do not believe it is appropriate to comment on the measurements of the Macintosh monitors that were published in the July 1990 issue because there is currently no standardized testing methodology or established guidelines by which to make comparisons.

- Regarding the Health Conclusions:

With any scientific issue there is a diversity of opinion. The MacWorld article excluded a large body of studies that discount a link between VDT use and a biological effect--for example: The University of Calgary, Alberta, Canada, 1989 Epidemiological Study on VDT Use and Spontaneous Abortion Risk; The University of Toronto, 1989 Rodent Reproductive Study; the Institute of Research for the Health and Safety of Workers, Montreal, Quebec 1984 Survey on VDTs and Pregnancy; and the 1985 Finnish Case Reference Study - Birth Defects and Exposure to VDTs During Pregnancy. The specific studies referenced by MacWorld raise valid questions but do not conclude a health risk for the computer user. We encourage further scientific research.

#### Background on VDT Radiation

- What is radiation?

Are there different kinds? Radiation involves a transfer of energy by waves or particles. There are two types of radiation. Ionizing radiation, such as X-rays, has proven to be damaging to living cells. Non-ionizing radiation is far less potent, and includes visible light, radio waves, and

low frequency electromagnetic emissions.

- What kind of radiation do VDTs emit?

Like television sets, VDTs may emit X-rays (ionizing radiation) at or near naturally occurring background levels. VDTs also give off non-ionizing radiation in the form of infrared light (heat), visible light, radio waves, and low frequency electromagnetic emissions. Apple's displays do not give off ultraviolet or microwave radiation in appreciable levels.

- What is ELF and VLF radiation?

Low-frequency radiation, a form of non-ionizing radiation, is generally divided into two groups: very low frequency (VLF) and extremely low frequency (ELF). VLF radiation falls into the frequency bandwidth between 30 and 150kHz, while ELF radiation refers to frequencies below 30 kHz. The intensity level of this radiation emitted by VDTs is comparable to that emitted by household electrical appliances.

- Is VLF or ELF radiation dangerous?

The prevailing opinion of the scientific community is that exposure to low frequency emissions does not pose a significant health risk. Available data indicate the human body absorbs only a minimal amount of radiation below 200 kHz. The low level of intensity of the fields emitted from VDTs is not considered harmful by the American Medical Association, the American College of Obstetricians and Gynecologists, the National Institute for Occupational Safety and Health (NIOSH) and the World Health Organization, among others.

However, with any scientific issue there is a diversity of opinion. There are several studies which suggest that long-term exposure to pulsed ELF fields (such as those emitted by VDTs) can result in biological changes to cells.

Because valid questions have been raised, Apple encourages further research on low frequency radiation. In fact, we are currently setting up a program to sponsor dedicated academic research in the low-frequency radiation field. We intend to continue monitoring the results of this research so that we can act responsibly to ensure the health and safety of our customers and employees.

## AppleShare: Server Startup with External Drives Attached

Revised: 8/12/91  
Security: Everyone

AppleShare: Server Startup with External Drives Attached

=====

Article Created: 5 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

The Macintosh that I'm using as an AppleShare server has an internal hard disk and two external volumes. In case of a power failure, I have the server set restart automatically. The problem is that the Macintosh checks for the external SCSI drives before the drives are ready.

Is there a way to make the server wait 30-60 seconds before checking for SCSI devices?

DISCUSSION -----

There is no way to have the server wait before it looks for available drives. The server waits for Drive 0 to be ready, though. By the time Drive 0 is ready and loaded, the other drives should be ready to mount.

## Macintosh: Definition of System Heap

Revised: 7/24/91  
Security: Everyone

Macintosh: Definition of System Heap

=====

Article Created: 14 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

What is a "system heap"?

DISCUSSION -----

The system heap is a special area of RAM set aside for things like fonts and DAs. The heap zone is used mostly by operating system data structures. The heap zone is an area in memory that may be allocated in relocatable and non-relocatable pieces, called heap blocks or heap pieces. The heap zone usually begins at \$B00 and extends to \$CAFF, but you should not count on those addresses being correct.

If you ever see an error message with the number -108, it probably means you need more space in your system heap. Increasing its size will help you if you have many fonts and DAs.

## System 7: Improving Performance on the Macintosh IIsi and IICI

Revised: 7/10/92  
Security: Everyone

System 7: Improving Performance on the Macintosh IIsi and IICI

Article Created: 5 July 1991  
Article Last Reviewed: 10 July 1992  
Article Last Updated:

TOPIC -----

Why do the Macintosh IIsi and IICI seem so slow with 256 colors or shades of gray? I am running System 7.

DISCUSSION -----

This is due to the video RAM in the 1MB RAM bank A (soldered on the logic board on the Macintosh IIsi). Using 256 colors makes this bank of RAM very busy (the more colors the busier). Consequently, access to anything else in this part of memory is slow.

Macintosh IIsi  
-----

On the Macintosh IIsi, adjust the RAM cache to at least 384K. As a result, bank A is all video RAM, RAM cache, and RAM used by the System. This makes the performance with 256 colors almost as good as with black and white. Setting the RAM cache higher than 384K does not help much. This will also work with the Macintosh IICI if you have four 256K SIMMs in RAM bank A.

Macintosh IICI  
-----

On a Macintosh IICI, if Bank A is not filled with 256K SIMMs (instead, it is filled with 512K, 1MB, 2MB, 4MB or 16MB SIMMs) it is harder to keep applications from sharing that RAM bank which is busy. You can try to boost the RAM cache to approximately the size of the memory in RAM bank A minus 600K and get similar results, but this takes memory away from your applications.

## System 7: 24-bit Addressing with More than 8MB of RAM

Revised: 7/24/91  
Security: Everyone

System 7: 24-bit Addressing with More than 8MB of RAM

=====

Article Created: 5 July 1991

### Article Change History

-----

08/21/92 - REVIEWED

- For technical accuracy; edited.

### TOPIC -----

How does the Macintosh operating system handle more than 8MB of physical RAM when it is not using 32-bit addressing?

### DISCUSSION -----

When a Macintosh is running in 24-bit mode (that is, when System 7's 32-bit Addressing is turned off or the Macintosh is running System 6.0.x) any physical memory over 8MB is allocated to the System, provided the Macintosh can see the memory in the first place, but it's not actually used. Even though the hardware can see all of the physical RAM, 24-bit addressing allows the use of only 8MB. You may see a large System allocation when checking "About this Macintosh" or "About the Finder" and think something is wrong, when in fact this is the way it should work.

System 7's 32-bit Addressing allows up to 1GB of total memory (including both physical and virtual memory).

System 7.x: Creating and Using Custom Icon Folders (2/95)

Article Created: 19 June 1991  
Article Reviewed/Updated: 9 February 1995

TOPIC -----

This article describes how to create folders that use custom icons and how to repair folders when a folder's icon becomes damaged or deleted, or when a folder loses its link to an ICON file.

DISCUSSION -----

System 7 lets you modify the existing icons any non-system file, folder, or volume. Custom icons are saved directly into a file's resource fork, and an attribute bit is set to alert the Finder to display a custom icon. Folders and volumes do not have resource forks, however, so custom icons are saved instead to an invisible file named ICON. This file is located at the root level of the folder or volume.

Creating a Folder That Uses a Custom Icon  
=====

Follow these steps to create a folder that uses a custom icon:

Step 1:  
Select the graphic to use for an icon. An icon in the Get Info window of any document is one possible source. You can also use a graphic application to create your own.

Step 2:  
Copy the graphic to the Clipboard by choosing Copy from the Edit menu.

Step 3:  
In the Finder, select the icon you want to change.

Step 4:

Choose Get Info from the File menu.

Step 5:

Ensure that the Locked box in the lower-left corner of the Get Info window is not checked. You cannot customize the icon of a locked file.

Step 6:

Click the icon at the upper-left of the Get Info window or press the Tab key to select it.

Step 7:

Choose Paste from the Edit menu.

Step 8:

Click the Close box to close the Get Info window.

If the selected graphic is bigger than the icon in the Get Info window, it automatically shrinks to fit.

#### Custom Icon Repair

=====

Sometimes custom icons created for files, folders, or hard disks become damaged or deleted. If the link between the folder or volume and the ICON file is lost, the Finder may display a generic document icon in place of the custom icon. When attempting to edit this icon through Get Info, you get an error message saying that the item cannot be found. If you have a damaged custom icon on a folder, follow these steps:

Step 1:

Create a new folder.

Step 2:

Copy the damaged folder's contents into the new folder.

Step 3:

Place the empty folder in the trash.

Step 4:

Give the new folder a custom icon by following the steps in the preceding section.

If you have a damaged custom icon on a volume, you can try a public domain utility called Disk Rejuvenator to correct it. You can try the steps outlined in the next section if you have a disk or file utility that lets you make invisible files visible. Another option is to reformat the volume.

WARNING! Formatting a volume erases all data; back up first.

#### ResEdit and File Utilities for Repairing Custom Icons

=====

There is a Finder attribute for folders and volumes called "Custom Icon". You can turn this attribute off using ResEdit. When the folder reverts to a normal folder icon, you can attach a new icon to it. ResEdit cannot access this attribute for volumes. You can also try to correct the problem by following these steps:

Step 1:

From the Finder, create another custom icon for a folder by following the steps in the preceding "How to Create a Custom Icon Folder section".

Step 2:

Using a file utility such as ResEdit, find the ICON file for this newly-created custom icon (it is at the root level of the folder to which it is attached) and make that file visible. Also make visible the ICON file at the root level of the affected volume.

Step 3:

In the Finder, copy the now-visible ICON file from the folder to the root level of the volume. You may receive the message "Are you sure you want to replace the older file..." If so, click OK. This restores the icon file.

Step 4:

Using the file utility, make the ICON file invisible again.

Step 5:

Click on the volume once to select it and choose Get Info from the File menu. You can now edit or delete this icon.

If you correct a damaged icon and it becomes damaged again before long, you might consider removing the icon from your system.

## System 7: LaserWriter Driver and Adobe Font Downloader

Revised: 9/18/92  
Security: Everyone

System 7: LaserWriter Driver and Adobe Font Downloader

=====

Article Created: 19 June 1991

### Article Change History

-----

09/17/92 - UPDATED

- With contact information.

### TOPIC -----

I receive the error message "Couldn't open the printer driver" when trying to use Adobe's Font Downloader under System 7. How do I fix this?

### DISCUSSION -----

Font Downloader expects the LaserWriter driver to be in the System Folder, while System 7 normally installs it in the Extensions folder. Simply move the LaserWriter icon from the Extensions folder into the System Folder to correct this problem. System 7 will still be able to locate the LaserWriter driver without a problem.

For the most current information on Adobe Font Downloader, including upgrades that may change this situation, contact Adobe directly. To locate Adobe's address and phone number, use the vendor name as a search string.

## System 7: Installing Adobe Font Library

Revised: 7/19/91  
Security: Everyone

System 7: Installing Adobe Font Library

=====

Article Created: 19 June 1991  
Article Last Reviewed: 13 July 1992  
Article Last Updated: 13 July 1992

TOPIC -----

This article gives instructions for installing the Adobe Font Library on a Macintosh running System 7.

DISCUSSION -----

- To install bitmap (screen) fonts, simply drag the font suitcase to the System Folder icon and System 7 will automatically install them in the System file. System 7 does not require Font/DA Mover to install bitmap fonts.
- To install outline (printer) fonts, simply drag the font icons (not the folder containing them) to the System Folder. System 7 will automatically install them in the Extensions Folder.

NOTE: If you are using a version of Adobe Type Manager prior to 2.03, you must move outline fonts from the Extensions Folder to the System Folder to work properly. If you are using 2.03 or later, ATM should work properly with outline fonts inside the Extensions folder - but make sure to completely remove older versions of ATM before installing the updated version.

## System 7: What Happens to Your Old Fonts

Revised: 9/2/92  
Security: Everyone

System 7: What Happens to Your Old Fonts

=====

Article Created: 19 June 1991

### Article Change History

-----

09/02/92 - REVIEWED  
• For technical accuracy; edited.

### TOPIC -----

What happens to the fonts already installed in my System 6.0.x System when I upgrade to System 7?

### DISCUSSION -----

Bitmapped fonts already installed in the System file will remain there.

PostScript fonts located in the System Folder will remain there. PostScript fonts installed after an upgrade to System 7 (by dragging them over the System Folder icon) are placed in the Extensions folder.

## System 7: How to Install and Run Adobe TypeAlign

Revised: 9/3/92  
Security: Everyone

System 7: How to Install and Run Adobe TypeAlign

=====

Article Created: 19 June 1991

### Article Change History

-----

09/02/92 - REVISED

- To be more clear and with version information.

### TOPIC -----

When I access TypeAlign, I get the error message "TypeAlign can't run until you have rebooted with the TypeAlign Startup in your System Folder". Is there a special way to install this program under System 7?

### DISCUSSION -----

Installing Adobe TypeAlign under System 7 is similar to installing it under previous versions of the Macintosh operating system. Here are the steps:

- 1) Drag the TypeAlign, TypeAlign Startup, and TypeAlign Help icons from the master floppy disk to your System Folder.
- 2) When "Some of these items need to be stored in special places... Put them where they belong?" dialog appears, click OK. The system will place TypeAlign in the Apple Menu Items Folder, TypeAlign Help in the System Folder, and the TypeAlign Startup in the Extensions Folder.
- 3) In order for TypeAlign to run properly, move the TypeAlign Startup icon from the Extensions Folder to the root level of the System Folder.

Note that at least TypeAlign version 1.0.5 is available. Contact Adobe for the most recent version information.

System 7: Adobe Type Manager 2.0 and 32-bit Addresssing

=====

Article Created: 19 June 1991  
Article Last Reviewed: 13 July 1992  
Article Last Updated: 13 July 1992

TOPIC -----

I'm using Adobe Type Manager 2.0 and 32-bit addressing under System 7. The system crashes whenever I select a font menu. What is the workaround?

DISCUSSION -----

The workaround is to disable 32-bit addressing. Adobe Type Manager 2.0 is compatible with 24-bit addressing, but incompatible with 32-bit addressing under System 7. Upgrade to a more recent version of ATM (at least 2.03), for 32-bit addressing to work properly.

## System 7: TypeAlign Font Not Available Error

Revised: 9/3/92  
Security: Everyone

System 7: TypeAlign "Font Not Available" Error

=====

Article Created: 19 June 1991

### Article Change History

-----

09/02/92 - UPDATED

- To provide contact and version information.

### TOPIC -----

The error message, "Outline Font Not Available" appears when I enter text into TypeAlign running under System 7. What causes this?

### DISCUSSION -----

This can be caused by two things:

- The outline (printer) fonts may be in the wrong location. Open the System Folder and verify that the outline fonts are there. If not, locate them and move them to the System Folder.
- If you are using TrueType versions of Helvetica, Courier, Times, and Symbol, TypeAlign will be unable to find an Adobe Type 1 version. TypeAlign currently does not support TrueType. Either remove the TrueType version of the font or use an Adobe Type 1 font instead.

For fullest compatibility, you should be using at least 1.0.5 of Adobe TypeAlign. Contact Adobe for the latest information; search for Adobe for contact information.

## System 7: DataDesk Keyboard Compatibility (11/94)

Revised: 11/8/94  
Security: Everyone

System 7: DataDesk Keyboard Compatibility (11/94)

=====

Article Created: 19 June 1991  
Article Reviewed/Updated: 08 November 1994

TOPIC -----

This article gives compatibility information for DataDesk keyboards used with System 7.

DISCUSSION -----

Some older DataDesk Macintosh 101 keyboards do not allow you to disable extensions under System 7 by holding down the Shift key during startup. There is no known workaround for this problem, short of temporarily replacing the DataDesk keyboard with an Apple keyboard.

Specific compatibility issues:

- Macintosh 101 Keyboard (Macintosh Plus) Version 1.0  
Incompatible INIT - Currently won't recognize any keys pressed during startup. Requires an upgrade to use extended part of the keyboard.
- Macintosh 101 keyboard (ADB) Version 1.0  
No INIT is needed - Won't recognize any keys pressed during startup.  
This keyboard is likely to be at least three years old.
- Macintosh 101 Keyboard (ADB or Macintosh Plus) Version 1.1  
Compatible with System 7.
- Macintosh 101e Keyboard (ADB or Macintosh Plus)  
Compatible with System 7.
- Macintosh Switchboard (ADB or Macintosh Plus)  
Compatible with System 7.

For further information, contact DataDesk. The address and phone number is in a separate article in the Tech Info Library.

## System 7: Initialize Drive if Disk First Aid Can't Repair

Revised: 8/25/92  
Security: Everyone

System 7: Initialize Drive if Disk First Aid Can't Repair

=====

Article Created: 19 June 1991

### Article Change History

-----

08/24/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

What should I do if Apple's "Disk First Aid" utility reports that it is unable to repair a disk's directory?

### DISCUSSION -----

If the Macintosh has been started up with the System 7 "Disk Tools" floppy disk and Disk First Aid cannot repair a hard drive's directory, the drive must be reinitialized with an appropriate formatting utility. Apple hard drives are initialized with Apple's HD SC Setup utility. Third-party hard drives require System 7-compatible initializing/formatting software supplied by the vendor.

IMPORTANT: Before initializing the drive, make at least one backup of the drive using System 7-compatible backup software, otherwise you will lose everything on the drive.

## System 7: Using Personal LaserWriter SC and LaserWriter IISC

Revised: 7/11/94  
Security: Everyone

System 7: Using Personal LaserWriter SC and LaserWriter IISC

Article Created: 19 June 1991  
Article Reviewed/Updated: 11 July 1994

TOPIC -----

I've installed System 7, and now I can't print to my LaserWriter IISC. The installer did not replace my old LaserWriter SC driver. I keep getting print errors when I use the driver that came with the printer. How do I fix this?

DISCUSSION -----

The LaserWriter IISC printer software is not compatible with any version of System 7. You might be able to print using the LaserWriter IISC print driver if background printing is turned off, but this is not recommended. To permanently fix this problem, you need to use the Personal LaserWriter SC printer driver from the Printing disk to print to this printer.

Copy the Personal LaserWriter SC driver from the System 7 Printing disk to the Extensions folder on your startup volume. Select the Personal LaserWriter SC icon in the Chooser.

You can use the Personal LaserWriter SC driver with both the Personal LaserWriter SC and the LaserWriter IISC. This is true for versions prior to System 7 as well.

### Article Change History:

24 Aug 92 - Incorporated similar articles and clarified that the Personal LaserWriter SC driver is the same as the LaserWriter IISC driver.  
11 Jul 94 - Clarified that the LaserWriter IISC driver is not system 7 compatible.

Security: Everyone

System 7: CD Technology Drive and CD Setup

=====

Article Created: 19 June 1991

### Article Change History

-----

09/02/92 - UPDATED

- To give contact information.

### TOPIC -----

I have a CD-ROM drive from CD Technology, Inc. After I load System 7 on my Macintosh IIx, and run the installer on the Macintosh CD Setup disk as instructed in the Group Upgrade Guide, I cannot connect the CD-ROM drive. How can I connect the CD Technology ROM drive?

### DISCUSSION -----

The CD Technology CD-ROM drive uses the system access modules on the System 7 CD Setup disk, but not the driver. After running the installer, delete the Apple CD-ROM and Apple CD Remote from the Extensions folder. Install the CD Technology driver version 1.32 (or later) in the System Folder.

NOTE: CD Technology version 1.32 causes system errors on 68000-based systems, but works correctly on 68020- and 68030-based systems.

Contact CD Technology, Inc. for the most recent information on their product; search on CD Technology for contact information.

## Macintosh System Software 6.0.7: Troubleshooting (1 of 2)

Revised: 7/15/91  
Security: Everyone

Macintosh System Software 6.0.7: Troubleshooting (1 of 2)

=====

Article Created: 18 June 1991  
Article Last Reviewed: 22 July 1992  
Article Last Updated: 22 July 1992

TOPIC -----

This article outlines the steps for troubleshooting system software version 6.0.7. Perform these operations in the order presented here.

DISCUSSION -----

### WDEF Virus

-----

The number one known problem is the WDEF virus. In version 6.0.5 and earlier versions of the system software, the WDEF virus might exist without creating major problems. This is not true in version 6.0.7. The presence of the WDEF virus can cause problems from the moment the computer is turned on. The most common results are the three error messages - "Bus Error," "Address Error," and "Coprocessor not Installed." Floppy disk copy procedures are known to suffer in particular, but the difficulties can appear at any time without any warning.

### Solution:

Use Disinfectant 2.4 (or later) or SAM 2.0.5 (or later) to detect and remove the WDEF virus. Disinfectant is available from various online services. Search on "Disinfectant" using BB Pathfinder in the AppleLink Information icon. SAM is available from Symantec. Other anti-virus applications may also assist in detection and removal.

### Incompatible Applications

-----

Incompatible applications cause the next most common problem. Older versions of applications are often incompatible. Some of the most commonly reported incompatibilities have been with Microsoft Works 2.00a and

MacWrite 5.0x. Fully compatible versions of these two programs are Microsoft Works 2.00e and MacWrite II 1.1v2.

An application that causes things to go wrong may not be the application that is currently running; it may be an application that ran previously. An application might corrupt some portion of memory and then never reference that area of memory during the remainder of its running time. However, an application launched later (possibly, an application that tested as compatible) may make a reference to the corrupted memory created by the earlier application. The result is a system error, most likely one of the three previously mentioned - "Bus Error," "Address Error," or "Coprocessor not Installed."

Solution:

Check with the publisher of any software package you are wondering about concerning compatibility with the 6.0.7 environment.

INITs and CDevs

-----  
The next possibility is closely related to applications. INITs and cdevs can be considered mini-applications. INITs are programs that run at startup and continue to run during the entire time that the Macintosh is on. Some cdevs can have a split personality. First, a cdev can exist only as a Control Panel item; but second, a cdev can also contain an INIT that may not be visible to the user.

Other cdevs that do not contain an INIT will not affect the operation of the system unless they are chosen from the Control Panel. This form of cdev can be thought of as a mini-program. If it isn't chosen by the user, it isn't run.

INITs and cdevs that contain INITs, are a different matter. They can affect a system from the early part of the startup process. If there are any incompatibilities with these items, a system can display error dialogs at any time. Then again, depending on what has been done since the Macintosh was started up, they may never cause any problem.

Solution:

Remove all INITs and cdevs that were not installed by Apple's System Software Installer program. Then test the Macintosh to see if the previous difficulties have gone away.

If the difficulties have gone away, and you must have the use of INITs and cdevs, reinstall one INIT or cdev at a time and then test for difficulties after each installation. Repeat this sequence until after the installation of one of the INITs or cdevs difficulties begin appearing. Then take one step back and remove the last installed INIT or cdev. Check with the publisher of that removed item to see if a later and compatible version is available. If it isn't, you will need to find a way to achieve those functions in a different manner until the publisher can provide an update.

### Third-Party SIMMs

-----

Some third-party SIMMs do not meet Apple's specifications. There are two SIMM issues listed here.

- The PC board on which the RAM chips are mounted is too thin to provide proper contact to both sides of the SIMM socket. The results are system error dialogs. There appears to be a very small sample of boards that are affected by this issue.
- The timing of the PAL chip on some SIMMs has proven to be out of specification. The 2MB SIMMs appear to be the most common offenders. Timing issues can also result in system error dialogs. Third-party vendors have been informed of the considerations involved with timing.

### Solution:

To determine if the SIMMs are at fault, replace the third-party SIMMs with Apple SIMMs and run tests to see if the previous problems continue. If the Apple SIMMs resolve the appearance of system error dialogs, replace the SIMMs.

### Hard Disk Drivers

-----

Hard disk driver software can have trouble performing correctly when installed in certain ways, or if the driver software is out of date. This is a problem with either Apple HD SC hard disks or various third-party hard disks. Before reinstalling system software, try this step, which is not as involved as doing a system software reinstallation.

### Solution: Procedure for Apple Hard Disks

Use the Apple HD SC Setup that ships with 6.0.7 (or later) to update the driver on the hard disk. The version of this hard disk driver is at least 2.0.3. Use the Drive button to select the hard disk that will be the startup disk. Press the Update button to update the hard disk driver software on the hard disk.

### Solution: Procedure for Third-Party Hard Disks

Some third-party hard disk drivers which are installed with an "Installer" type of program may have difficulties if the installer was launched from a System 6.0.5 (or earlier) environment.

Usually this means that the third-party installer was shipped on a floppy disk which has System 6.0.5 (or earlier) on the disk. The installer disk is used to boot for the installation. In this way, the hard disk driver is installed from 6.0.5 (or earlier) into 6.0.7. Sometimes a Macintosh system which has been in place for a while is updated to version 6.0.7. The third-party hard disk drivers were in place prior to the 6.0.7 update.

In either case, follow these steps to resolve the problem:

- 1) Create a third-party hard disk installer disk with System 6.0.7 (not 6.0.5) on it. Make a new installer disk or update the installer disk to version 6.0.7.
- 2) Boot from the third-party hard disk installer with 6.0.7 on it.
- 3) Launch the third-party hard disk installer.
- 4) Update the third-party hard disk's driver. (Most installers have an Update selection.)
- 5) Restart and test for previous difficulties.

If you have worked through all of the procedures described in this document and you still have problems, you need to reinstall System Software 6.0.7. Search for the second part of this article on System 6.0.7 Troubleshooting for advice on reinstalling the system software.

## Macintosh System Software 6.0.7: Troubleshooting (2 of 2)

Revised: 7/15/91  
Security: Everyone

Macintosh System Software 6.0.7: Troubleshooting (2 of 2)

=====

Article Created: 18 June 1991  
Article Last Reviewed: 22 July 1992  
Article Last Updated: 22 July 1992

TOPIC -----

If the difficulties persist after you work through the four steps outlined in part 1 of this article, review the installation of the system software. This document (part 2 of the article) gives the proper procedures for reinstalling system software 6.0.7.

DISCUSSION -----

Do not use Minimum Install. The Minimum Install option of the System Software Installer is meant for creating bootable floppy disks and may not contain all the resources you need for a complete system.

You may install using the "Easy Install" option or by customizing which system resources are written to your disk. Below is the first of two custom installation procedures.

- 1) Start up from the Installer floppy disk.  
(800K=System Tools; 1.4MB=System Startup).
- 2) Remove from the System Folder any items that you wish to save, and that weren't installed with Apple's Installer.
- 3) Drag the System Folder to the Trash.
- 4) Empty the Trash.
- 5) Launch the Installer. Now you have the choice to do an Easy Install, or to customize your installation. This will be more involved, but may be the best approach. To do this, click on the Customize button. This will present a scrolling text field. Here are the choices you must make:

- AppleShare (workstation software)
- Software for AppleTalk Responder
- 32-Bit QuickDraw
- Printer
- Model of Macintosh

You will want AppleShare if you are using AppleShare file servers. The network administrator may want you to have AppleTalk Responder. Some applications (usually graphic programs) require 32-Bit QuickDraw. You will need to know which printer to use. In the case of the ImageWriter, you need to know whether it is an AppleTalk network printer or a locally attached printer. And finally, you will need to know which model of Macintosh you are using.

Shift-click on each of the choices in the scrolling text field.

- 6) Make sure you see the disk displayed on which you want to install the system software, and click the Install button.

The following steps are for the second custom installation method. Use this procedure with understanding and caution. This solution is not verified, however it solved difficulties with 6.0.7 at certain sites. This is more involved than the last procedure, and requires more patience when trying this sequence. Certain rules appear to be violated, but for good reasons.

- 1) Start up from the Installer floppy disk.  
(800K=System Tools; 1.4MB=System Startup)
- 2) Remove from the System Folder any items that you wish to save, and you didn't install with Apple's Installer.
- 3) Drag the System Folder to the Trash.
- 4) Here is where the rules are bent. Empty the Trash and drag a copy of the System Folder from the Installer floppy disk onto the hard drive. BUT don't stop here! Now continue with step 5 of the first custom installation sequence.

There are no guarantees with this procedure. But it is worth the time if you continue to have difficulties.

If you still have difficulties after attempting all of these procedures, make backups of all important files. Then reformat the hard drive and reinstall system software 6.0.7. On Apple hard disks be sure to use Apple HD SC Setup v2.0.3 or later to reformat (reinitialize). For third-party hard disks, use their formatting or installation software.

If you continue to have problems, ask your service provider to check for hardware problems.

## Macintosh System Software 6.0.7: Compatibility Report (6/95)

Revised: 6/6/95  
Security: Everyone

Macintosh System Software 6.0.7: Compatibility Report (6/95)

Article Created: 6 February 1991  
Article Reviewed/Updated: 6 June 1995

TOPIC -----

The following is a list of third-party software applications that Apple tested with system software 6.0.7. This list should be used as a snapshot of compatibility as of the day of 6.0.7 introduction.

DISCUSSION -----

This report does not cover all Macintosh application software, it covers only those applications that Apple reviewed. For more detailed information on compatibility of an application and system software 6.0.7, contact the developer or publisher of that product.

Apple did not test every feature of the application. Instead, each application was run through a series of common functions: launch, open a simple document, open DAs, cut/paste, and print).

This report reflects compatibility information on the version number of the application listed, and in some instances does not reflect the most currently available version of a particular application. This list is not intended as an endorsement nor advertisement of any product. This list is meant to provide you with the most current information regarding compatibility of system 6.0.7.

### Note:

Testing was done on the Macintosh Classic, Macintosh LC, Macintosh IIsi, Macintosh Plus, Macintosh SE, Macintosh SE/30, Macintosh IICx, Macintosh IIX, Macintosh IICI, Macintosh IIfx, and Macintosh Portable personal computers using system software 6.0.7. Ratings for all applications indicate performance of the application running on released CPUs and released system software.

The following products passed our compatibility tests. If any additional comments were needed, then they are mentioned in the "COMMENTS" field.

| APPLICATION             | VERSION | DEVELOPER                | COMMENTS         |
|-------------------------|---------|--------------------------|------------------|
| -----                   | -----   | -----                    | -----            |
| 4th Dimension           | 2.0.11  | ACI US, Inc.             |                  |
| Adobe Illustrator       | 1.9.3   | Adobe                    |                  |
| AutoCAD                 | v10c4a  | AutoDesk                 | Requires an FPU. |

AppleShare File Server: Allowing Apple II Network Startup

=====

Article Created: 5 June 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

This article tells how to set up your AppleShare File Server software so that Apple IIGS and Apple IIe systems can start up over the network.

An earlier version of this article appeared in the June 1990 "TechBeat" and in the "Apple II Tech Bulletin" for February-March 1990. Since then, new versions of the Apple IIGS and Macintosh operating systems have been released, requiring updated documentation.

DISCUSSION -----

Assuming the hardware is already set up, the installation process should take from one to two hours. This article assumes you are installing AppleShare on a newer Macintosh running System 6.0.7. Note: If you are installing on one of the older Macintosh computers, for example an SE/30, System 6.0.5 would be an acceptable replacement for System 6.0.7.

This article also applies to those with existing AppleShare File Servers. Where necessary, we will explain what material to skip over.

Besides Macintosh system software, you need the AppleShare File Server software (version 2.0.1), Apple part number M0548/B. Finally, you need Apple IIGS System Software Update Version 5.0, Apple part number A0013LL/A. (This version is now shipping with version 5.0.4 in the box.)

Note that IIGS System 5.0.4 is a three-disk set. The third disk, a Macintosh disk called "Apple II Setup", is essential. You will need to buy at least one IIGS System 5.0 Software Update, because this third disk does not ship with new IIGS systems. Table 1 lists the disks required. You also need one blank 800K disk.

Note: For future reference, if a new version of IIGS system software is released, use the complete three-disk set from that system instead of version 5.0.4.

Table 1: Required Disks

| Disk Name                              | Format      | Comment                    |
|----------------------------------------|-------------|----------------------------|
| System Startup 6.0.7                   | Mac 1.44MB  |                            |
| System Additions 6.0.7                 | Mac 1.44MB  |                            |
| Network Products Installer 6.0.7       | Mac 1.44MB  |                            |
| AppleShare File Server 2.0.1 Installer | Mac 800K    | Part of A'Share 2.0.1.     |
| AppleShare File Server 2.0.1 Admin     | Mac 800K    | Part of A'Share 2.0.1.     |
| Apple II Setup 2.0.1                   | Mac 800K    | Part of A'Share 2.0.1.     |
| -->Obsolete disk!                      |             |                            |
| /System.Disk                           | ProDOS 800K | Part of IIGS System 5.0.4. |
| /System.Tools                          | ProDOS 800K | Part of IIGS System 5.0.4. |
| Apple II Setup 2.1.3                   | Mac 800K    | Part of IIGS System 5.0.4. |
| -->New version.                        |             |                            |

## 1. Setting up the AppleShare File Server

-----  
Follow these steps to set up the AppleShare File Server:

- 1) If you have an existing server, start up from the Network Products Installer disk and install "Apple II Setup (v2.0.1)". (Others should skip to the next paragraph.)
- 2) When the Installer prompts you for the "Apple II Setup" disk, insert the Apple II Setup version 2.1.3 disk that came with IIGS System Software 5.0.4.

Do not insert the obsolete Apple II Setup disk that comes in the box with AppleShare 2.0.1. For those with an existing file server, proceed to Section 2, "Preparing AppleShare for Apple II Users".

If you haven't set up your server yet, here is how to do it:

- 1) Boot the Macintosh with the System Startup disk
- 2) Launch HDSC Setup and initialize the hard disk. When giving the hard disk a name, use a short name that fits ProDOS conventions. The name must begin with a letter (A to Z) and contain nothing but letters, numerals and periods. No spaces. Lower case is permitted. For this example, we will name the server volume "A2".
- 3) After the hard disk has been initialized, quit HDSC Setup and launch the Installer. Click "Easy Install".

- 4) When the installation is complete, quit the Installer.
- 5) Double-click on the hard disk icon and open the System Folder.
- 6) Drag "Easy Access," and any printer drivers you don't need, to the Trash. You can also delete MultiFinder. If you won't be doing any printing from the file server, you can throw away Backgrounder and PrintMonitor.
- 7) When you are done, select "Empty Trash" from the Special menu and close all open windows. Then select "Shut Down" from the Special menu.

With the cleanup out of the way, it's time to install the software:

- 1) After the Macintosh ejects the System Startup disk, restart from the Network Products Installer disk.
- 2) Launch the Installer and select "AppleShare File Server (v2.0.1)" and holding down the Shift key, select "Apple II Setup (v2.0.1)".
- 3) Click Install. The Installer will prompt you for the "AppleShare File Server" disk (that's the AppleShare Installer disk), and shortly thereafter, the "AppleShare Administration" disk.
- 4) When it prompts you for the "Apple II Setup" disk, insert the Apple II Setup version 2.1.3 disk that came with IIGS System Software 5.0.4.

Important: Do not insert the obsolete Apple II Setup disk that comes in the box with AppleShare 2.0.1

- 5) When the Installer is finished, quit and restart the Macintosh, letting it start up from the hard drive.
- 6) The hard drive isn't an AppleShare File Server yet, so you must set it up. Open the System Folder on the hard drive and double-click "AppleShare Admin".
- 7) When asked if you want to "Prepare volume 'A2' for use with AppleShare?", click OK. You'll be asked to give the file server a name, for example, "Apple II Forever".
- 8) Next, the system will prompt you for a Users and Groups file. Open the Server Folder and click "New". Create users and groups according to your needs and preferences, starting with the Administrator.
- 9) When you are done, select "Save Users and Groups as..." from the File menu and save the Users and Groups in the Server folder.

## 2. Preparing AppleShare for Apple II Users

-----  
Here's how to prepare AppleShare for Apple II Users:

- 1) If you haven't done so, get into the AppleShare Admin program. (There is no need to shut down your server to do this.)
- 2) Under the Server menu select "Server Info" and click on the check box marked "Apple II Features".
- 3) Click "Save". Quit the AppleShare Admin program.
- 4) If you were updating an existing file server, shut down the server and restart. Others can merely select "Restart" from the Special menu to restart the Macintosh. It will come up as an AppleShare File Server.

If you want the file server to support network startup only for Apple IIe users, the server is now ready to start them up over the network, once you set the access privileges on the volume. Users must be able to "See Files, See Folders" to start up.

To set the access privileges, follow these steps:

- 1) Get into AppleShare Admin and select "Volume List" from the Volume menu.
- 2) Double-click the server volume.
- 3) Set the access to "See Files, See Folders" and apply the changes to all enclosed folders -- unless you have an existing file server, in which case you will probably need to assign access by folder.

Apple IIe users need "See Files, See Folders" access to the top level of the server startup volume. Whether you set these changes for the Administrator only, all users, or just the particular groups, depends on how you have planned your server.

If you want IIGS users to be able to start up over the network, you should continue with the next section, which tells you how to install IIGS system software onto the server, over the network. This step is required only if the IIGS users will be starting up over the network. If the IIGS workstations have hard drives, you should set them up to start up GS/OS on their hard drives, and install AppleShare. This way, they can mount server volumes on the desktop, just like Macintosh users.

### 3. Installing IIGS System Software over the Network

-----  
Make sure you have the AppleShare File Server and the Apple IIGS connected via LocalTalk or similar network cabling. The IIGS should have a minimum of 1MB of RAM and one Apple 3.5 Drive. (You'll save time if you equip the IIGS with two Apple 3.5 Drives.)

When you turn on the IIGS, hold down the Control Open-Apple Escape keys to get into the text Control Panel. If you have defined a RAM disk, make sure you leave the system with at least 1MB of memory. Under Slots, ensure that the Startup Slot is set to 5, and that Slot 5 is set to "SmartPort" and Slot 7 to "AppleTalk" or "Built-In AppleTalk". Slot 1 should be set to

"Your Card", or on a ROM 03 IIGS to "Built-In AppleTalk". Exit from the Control Panel and turn off the computer.

Be sure you have the original (unmodified) System.Disk and System.Tools diskettes. Lock both diskettes to prevent accidental deleting of critical files. You will also need one blank 800K disk to use as an AppleShare startup disk. Follow these steps:

- 1) Insert the System.Disk and power on the IIGS.
- 2) When the Finder desktop appears, insert the blank disk and initialize it. Call it "AppleShare".
- 3) Launch the Installer from System.Tools. If you have two drives, eject the System.Disk. If you have one drive, eject the System.Tools disk.
- 4) Insert the blank "AppleShare" disk you just initialized and click the "Disk" button until its name appears.
- 5) Select the installer script entitled "AppleShare on 3.5 Disk" and click Install. Before installing, the system will display an alert message explaining not to install this on your only copy of the system disk. Click "Perform This Update" to continue. Some disk swapping will be required.
- 6) When the installation is complete, make sure the AppleShare startup disk you just created is in drive 1, and restart. To save time, you can hold down the Control Open-Apple Reset keys rather than quitting to the Finder and doing a Shutdown.
- 7) When the Finder desktop is on the screen, use the mouse to select the graphic Control Panel under the Apple menu. If it isn't already highlighted, click on AppleShare.
- 8) Select the file server and connect using the Administrator name and password. Then select the AppleShare File Server volume and mount it. Close the graphic Control Panel.
- 9) Run the Installer on System.Tools. Click the "Disk" button until the file server name appears -- in our example, "A2".

Here is how to install some files over the network onto the file server volume:

- 1) Select the following scripts: Server Network Startup, Server Quick Logoff and optional scripts.

For optional scripts, select anything that IIGS systems staring over the network will require. For instance, if you need access to a network printer, like a LaserWriter or an AppleTalk ImageWriter, install those scripts.

- 2) Select the optional scripts you need by holding down the Open Apple key

when you click on them.

Caution: do not try to install "Latest System Files" or "Latest System Files (No Finder)", or IIGS users will not be able to start up over the network. Note: There was an error in the original version of this article that indicated you should install the "Latest System Files (No Finder)" script. It was corrected in a subsequent issue of "TechBeat."

When you click "Install", the system installs the IIGS system software over the network. To show network activities, double arrows at the top left of the screen will flash. The installation may take some time.

- 3) Before you run off to grab a coffee, wait for the alert message telling you to "install this update only on a file server's startup volume". Click "Perform This Update" to continue.
- 4) When the installation is complete, hold down the Control Open-Apple Escape keys to enter the text Control Panel.
- 5) Under Slots, set the startup slot to 7. The next time you start up the IIGS, it will be over the network. First, however, you have to set up the server for IIGS users. See section 4 below.

#### 4. Setting up the File Server for IIGS Users

-----  
Follow these steps:

- 1) Leaving the file server running, get into the AppleShare Admin program.
- 2) Use the Shift-click method to highlight all the IIGS users you want to start up over the network.
- 3) Select "Set Startup" under the Apple II menu.
- 4) To have IIGS users start up into the Finder, select "Finder" under the System folder. You can also select a default network printer if one is available, and if you installed the drivers for them in section 3. Note that any printers to be selected must be powered up and visible over the network.

For Apple IIe users, you can set the startup application to be any ProDOS 8 application (file type SYS). Apple IIe systems that will start up over the network must be equipped with AppleShare Workstation cards and 128K of RAM. They must also be enhanced. (If you will be running Aristotle Admin, you'll need an Apple II Memory Expansion card with at least 256K of RAM. IIGS users who want to run Aristotle Admin need to define a RAM disk with 256K of RAM.) IIGS users can also start up to any ProDOS 8, ProDOS-16, or GS/OS application.

When you have finished setting up the startup information for your Apple II users, all that remains is setting the access privileges:

- 1) Under the "Volumes" menu, select "Volume List", double-click on the server volume, and a dialog box will be displayed.
- 2) Set the access privileges so that everyone can "See Files, See Folders", and apply changes to all enclosed folders, unless you have an existing server.

In such a case, you should not apply changes to enclosed folders, as there may be folders you do not want IIGS users to have access to. IIGS users need "See Files, See Folders" access to the top level of the server startup volume, the System Folder, and all folders within it. They will also need the same access to the Icons folder, which holds IIGS Finder icons. Users may experience errors if they don't have sufficient access for various operations. If you find some IIGS software that needs write access to a particular folder, you should lock that folder so that adventurous users can't throw it away.

- 3) When you are finished setting up access privileges, quit from the AppleShare Admin program.

## 5. Booting over the Network

-----  
You should now be able to start up over the network with a IIGS or a IIe. A IIGS starting up over the network displays several different screens during the startup process. You can verify you installed the correct version of the Apple II Setup on your file server by watching the "Starting up over the network" screen. It should say "2.1.3 GS.OS" at the top right if you used version 2.1.3, which comes with IIGS System 5.0.4.

After a few moments, the system prompts the user for a user name or allow guest access, if it is enabled. Be sure to test server logon as a normal user, and not just as the Administrator. That way you can uncover any access privilege problems. If you ever see an error message, take note of any error codes and compare them to the list in the back of the "ProDOS Technical Reference Manual" or in the "Apple IIGS GS/OS Reference." Two of the most common errors are listed in the Appendix at the end of this article. You'll find that most errors are easily explainable unless you mixed up software versions during installation.

You have now completed the installation of software to allow IIGS and IIe users to start up over the network.

## Appendix: Common Errors

-----  
Cannot load file Start.GS.OS

Error = \$0046

This is the message you get if you failed to follow Step 3 correctly. It is a ProDOS file system error \$46, which means "Path not found". The GS/OS files the system requires to start up could not be found on the file server. If you have multiple file-server volumes, verify you installed the IIGS System Software over the network onto the server startup volume.

Unable to load descriptors

Error was \$004E

This message denotes an access privileges problem. It is a ProDOS file system \$4E error. This means the user had insufficient access privileges to complete the required operation, or, possibly, the file was locked. Most likely, you haven't given the user who experienced the error "See Files, See Folders" access to the top level of the server startup volume, the System folder, and all folders within it.

## Macintosh LC, Ile Card: Printer Port already in use Message

Revised: 7/2/92  
Security: Everyone

Macintosh LC, Ile Card: "Printer Port already in use" Message

=====

Article Created: 5 June 1991  
Article Last Reviewed: 2 June 1992  
Article Last Updated:

TOPIC -----

Why do I get a "Printer Port is already in use" message when starting up the Apple Ile Card application program?

DISCUSSION -----

This message comes up when the Macintosh is trying to use the Printer Port for a LocalTalk (network) connection and the Apple Ile card is trying to use the port for serial data. This resulting conflict causes the "Printer Port is already in use" message.

If you are connected to a LocalTalk network in the Printer Port, use the "Network Printer" icon and not the "Printer Port" icon in the Slots menu. See the manual for information on selecting the network printer.

If you are connected to a serial printer in the Macintosh printer port, return to the Macintosh Chooser and select "AppleTalk Inactive". This removes the conflict, and the port-in-use message will no longer appear when you start the Ile application.

## Apple IIe Card: Troubleshooting Apple IIe Applications

Revised: 8/3/95  
Security: Everyone

Apple IIe Card: Troubleshooting Apple IIe Applications

=====

Article Created: 7 June 1991  
Article Last Reviewed/Updated: 03 August 1995

TOPIC -----

If an Apple IIe application doesn't seem to work properly on the Apple IIe Card, see the troubleshooting procedures in this article.

DISCUSSION -----

Changing General Option Panel Settings:

-----

- If text is hard to read, use monochrome monitor or switch to monochrome mode on a color display. Text is hard to read, because of the higher resolution of Mac monitor.
- If an application won't boot, when set to Fast speed, run at it at Normal speed.
- If an application seems slow, run it at Fast speed to get best performance.
- On some applications, do not turn Type Ahead "On". Program will lock up when you start to type.
- On some applications, if the Auxiliary Memory is turned on, the Memory Expansion card is ignored, even if it is installed in a slot. Do not turn on Auxilliary Memory, unless the application asks for it.

How to Change Slot Settings in the Option Panel

-----

Change them one at a time in the following order:

- 1) If the application won't boot, the program seems to hang, or garbage appears on screen, remove the clock card.

- 2) If the application won't boot, the program seems to hang, or garbage appears on screen, remove the memory card.
- 3) If the application won't boot, the program seems to hang, or garbage appears on screen, remove all unnecessary cards.
- 4) If the application is still not working, study the configuration of the Apple IIe that the program is currently running on. Then, set up the Apple IIe Card's slots so that they are the same as those in the actual Apple IIe.
- 5) Some applications can only print directly to an ImageWriter with the printer icon only in slots 1 and 2.
- 6) Some applications can only print directly to ImageWriter with printer icon only in slot 1.

#### Changing SmartPort Settings in the Option Panel

-----

Due to copy protection, some 3.5-inch application disks must be booted from the external UniDisk Drive (white 3.5-inch drive). Make the external drive, slot 5 drive 1.

#### Hardware Configurations

-----

- 1) Some programs have mouse and joystick conflict. This also happens on the Apple IIe computer. To use the mouse, remove the joystick. Otherwise, the mouse will appear erratic.
- 2) With some programs, it is better to use the keyboard or joystick control, because the mouse is very sensitive. (The same thing happens less apparently on the Apple IIe.)
- 3) Some programs must use two 5.25-inch disk drives. This is not a problem; you just need two 5.25-inch disk drives (the Apple 5.25-inch Drive, which is the only Grey drive).

#### Problems That Cannot Be Overcome

-----

- An application tries to access Apple-IIe-specific hardware (due to copy protection or poor code). Generally, these programs won't work on the Apple IIGS either.
- An application does not print to a serial printer, only a parallel printer, and there is no parallel port on the LC. (Possibly a serial-to-parallel converter would work, but we did not test this).
- If the application uses special cards that are not available in the Slot Settings, the program will not work.

In general, rules that apply to an Apple IIe application running on the IIe are still in effect on the Apple IIe Card. If the application requires the KeyCaps to be down, the KeyCaps must be down. If DOS 3.3 must first be loaded, DOS 3.3

must be loaded first.

## Apple II Workstation Card: Description (11/96)

Revised: 11/21/96  
Security: Everyone

Apple II Workstation Card: Description (11/96)

Article Created: 15 July 1991  
Article Reviewed/Updated: 18 November 1996

TOPIC -----

This article describes the Apple II Workstation Card. This product has been discontinued and is no longer available from Apple.

DISCUSSION -----

The Apple II Workstation Card connects the Apple IIe computer to an AppleTalk network using the LocalTalk Cabling System. This card includes a built-in Super Serial port for direct connection to serial devices such as ImageWriter printers. This card is ideally suited to educational environments where users want to share printers and reduce the amount of time spent handling disks.

The Apple II Workstation Card, together with the AppleShare IIe Workstation software included with it, gives users of enhanced Apple IIe computers access to AppleShare file servers, network printers (such as LaserWriter and ImageWriters), and to AppleShare print servers. Also, in conjunction with an AppleShare file server connected to an AppleTalk network, allows Apple IIe users to start up from the file server without using local disk drives.

Apple IIe users can print to network printers and share information stored on AppleShare file servers. At the same time, other Apple II, Macintosh, and MS-DOS users can access folders, documents, applications, and shared storage. Using an AppleShare file server or network printer is as easy as using a local ProDOS disk or serial printer.

### System and Network Requirements

An enhanced Apple IIe computer with 128K RAM, monitor, LocalTalk cabling and Apple II Workstation Card installed.

An Apple IIGS system (in which the function of the Apple II Workstation Card is

built-in).

If the network doesn't include an AppleShare file server, each workstation requires a 3.5-inch disk drive.

To initially load workstation software onto an AppleShare file server, a 3.5-inch disk drive is required at one of the workstations.

#### Recommended Equipment

-----  
The following are recommended, but not required.

One or more AppleShare file servers (for diskless startup and file server access).

One or more LaserWriter, ImageWriter II, or ImageWriter LQ printers.

#### Technical Specifications

-----  
Processor: 65C02, two-megahertz clock speed

Memory: 16K RAM, 64K ROM

Two 8-pin minicircular (RS-422) ports:

- one LocalTalk port
- one Super Serial port

## 80-Column Text Card: Specifications (11/96)

Revised: 11/18/96  
Security: Everyone

80-Column Text Card: Specifications (11/96)

=====

Article Created: 31 May April 1991  
Article Reviewed/Updated: 14 November 1996

TOPIC -----

This article describes the Apple IIe 80-Column Text Card. This card has been discontinued and is no longer available from Apple.

DISCUSSION -----

The Apple IIe 80-Column Text Card doubles the standard display of an Apple IIe to 80 characters per screen line. With a video monitor connected to the computer, you can view 24 lines of either 40 or 80 characters each; and from the keyboard, easily switch between these modes.

### Installation

-----

The 80-Column Text Card plugs directly into the Auxiliary Connector slot inside the computer, requiring no cables or additional connectors.

### System Requirements

-----

To use the Apple IIe 80-Column Text Card, you need:

- an Apple IIe (64K RAM or more)
- an available Auxiliary Connector slot
- a suitable high resolution video display device

## Apple II Memory Expansion Cards: Decsription (11/96)

Revised: 11/21/96  
Security: Everyone

Apple II Memory Expansion Cards: Decsription (11/96)

Article Created: 31 May 1991  
Article Reviewed/Updated: 15 November 1996

TOPIC -----

This article describes Apple's three Apple II Memory Expansion Cards.

DISCUSSION -----

### Overview

-----  
An Apple Memory Expansion Card adds up to one megabyte (1MB) RAM to any Apple II personal computer, allowing it to run more sophisticated applications and to create larger files. On the Apple IIGS personal computer, memory expansion lets you run high-performance programs that take full advantage of the computer's sound and graphics capabilities.

Three cards are available:

- Apple IIGS Memory Expansion Card
- Apple IIc Memory Expansion Card (for Apple IIc only, not Apple IIc Plus)
- Apple II Memory Expansion Card (for Apple IIe, Apple II Plus, and Apple II computers)

These cards are compatible with three operating systems: ProDOS, DOS 3.3, and Pascal 1.3. (Earlier versions of Pascal can be upgraded to version 1.3.) DOS 3.3 programs cannot be booted from the Memory Expansion Card.

Environmental requirements are the same for all three cards:

- ambient temperature: 50 to 104 degrees F (10 to 40 degrees C)
- relative humidity: 0% to 95% (non condensing)

Voltage is the same for all three cards: 4.75 to 5.25 volts DC

Apple IIGS Memory Expansion Card

-----

This card is used with an Apple IIGS personal computer with a monitor and disk drive.

Power Consumption:

- operating: 200 milliamps in 256K configurations  
600 milliamps in 1MB configuration
- standby: 140 milliamps in 256K configuration  
370 milliamps in 1MB configuration

Apple IIc Memory Expansion Card/Kit

-----

The Apple IIc Memory Expansion Card is used with an Apple IIc personal computer (model number A2S4100).

The Apple IIc Memory Expansion Kit is used with an Apple IIc personal computer (model number A2S4000).

Power Consumption:

- operating: 100 milliamps in 256K configurations  
200 milliamps in 1MB configuration
- standby: 90 milliamps in 256K configuration  
180 milliamps in 1MB configuration

Apple II Memory Expansion Card

-----

The Apple II Memory Expansion Card is used with an Apple IIe personal computer (preferably enhanced) that has a monitor and disk drive, or with an Apple II Plus or Apple II personal computer with a monitor and disk drive.

Power Consumption:

- operating: 100 milliamps in 256K configurations  
200 milliamps in 1MB configuration
- standby: 50 milliamps in 256K configuration  
150 milliamps in 1MB configuration

Apple II Memory Expansion Card Technical Reference

=====

The Memory expansion card looks like, operates as, and is accessed exactly the same way as an Apple Protocol Converter device.

There are only two ways to access the card:

- as an Apple Protocol Converter device
- as a RAM disk.

# ..TIL07883-Apple\_II\_Memory\_Expansion\_Cards-Decsription\_11-96.pdf

Through the protocol converter, you can access all the memory on the card at any time.

## Apple II Video Overlay Card: Description (11/96)

Revised: 11/21/96  
Security: Everyone

Apple II Video Overlay Card: Description (11/96)

=====

Article Created: 31 May 1991  
Article Reviewed/Updated: 18 November 1996

TOPIC -----

This article describes the Apple II Video Overlay Card. This card has been discontinued and is no longer available from Apple.

DISCUSSION -----

### Overview

-----

The Apple II Video Overlay Card offers Apple II computer owners a wealth of possibilities for learning and creativity by merging video and computing.

The Apple II Video Overlay Card lets you superimpose Apple II screen images on video from a variety of sources: VCR, video disc, video camera, or television. It also allows you to display the combined images of an RGB or composite monitor and to record them on a VCR.

You start by using the Apple II application of your choice to create your own text, graphics, or animations. Then with VideoMix, the software included with the card, you control where these overlays appear and blend them with the video to achieve the effects you want.

With the Apple II Video Overlay Card and an Apple IIGS or IIe computer, you can add your own captions and notes to educational videos. You can also create your own video productions and interactive application for use at home or in school.

### System Requirements

-----

To use the Apple II Video Overlay Card, you will need one of the following systems:

- an Apple IIGS personal computer with at least 512K of RAM, ROM version

01 or 03, and at least one 800K 3.5-inch disk drive; and a VCR, videodisc player, or video camera

- an Apple IIe personal computer with 128K of RAM and an enhanced main logic board (revision B); and a VCR, videodisc player, or video camera

To display your videos, you can use the Apple IIGS or IIe computer with either the AppleColor RGB Monitor or the AppleColor Composite Monitor. The AppleColor RGB Monitor comes with the required DB-15 connector. The AppleColor Composite Monitor comes with the required RCA cable.

#### Technical Specifications

- NTSC output: the output of the Apple II Video Overlay Card meets RS-170A output specifications with RS-170A input.
- Environmental requirements
  - Operating temperature: 50 to 104 degrees F (10 C to 40 degrees C)
  - Storage temperature: -40 to 116.6 F (-40 to 47 degrees C)
  - Relative humidity: 20% to 95% (noncondensing)
  - Altitude: 0 to 10,000 ft. (0 to 3,048 m)

## Apple 3.5 Drive: Specifications (Discontinued)

Revised: 7/12/94  
Security: Everyone

Apple 3.5 Drive: Specifications (Discontinued)

=====

Article Created: 31 May 1991  
Article Reviewed/Updated: 12 July 1994

TOPIC -----

This article describes the Apple 3.5 Drive.

DISCUSSION -----

The Apple 3.5 Drive stores 800K of data on a single 3.5-inch disk. It's a flexible, economical choice for owners of the Macintosh Plus, Macintosh SE, and Apple IIGS personal computers who want high capacity-storage in a small inexpensive package.

### System Requirements

-----

To use the Apple 3.5 Drive, you need one of the following systems:

- Macintosh Plus
- Macintosh SE
- Macintosh 512K Enhanced
- Apple IIGS

### Technical Specifications

-----

- Recording medium
  - disk diameter: 3.5 inches
  - recording surfaces: 2
  - tracks per inch: 80
  - formatted data capacity: 800K
  - Unformatted data capacity: 1,246 kilobytes
  - Track density: 135 TPI

Use nothing but certified double-sided disks in the Apple 3.5 Drive.

- Drive Characteristics
  - seek time (track to track): 6 milliseconds maximum

settle time: 30 milliseconds maximum  
drive startup time: 600 milliseconds maximum  
Disk speed:  
Data transfer rate: 489.6 kilobits per second  
Heads: 2

- Head position accuracy:  $\pm$  0.035mm

- Interfaces

Connects directly to the disk-drive port of the Macintosh 512K Enhanced, Macintosh 512K with ROM upgrade, Macintosh Plus, Macintosh SE, or Apple II GS. With the Apple II GS, an additional drive can be daisy-chained to the first drive.

- 19-pin D-style connector for one additional drive
  - Apple 3.5
  - Apple 5.25
  - UniDisk 3.5

- Electrical requirements

+12 Volts

standby: 10 microamps  
typical: 120 milliamps  
peak: 600 milliamps  
(during eject only: 2-second maximum duration)

+5 Volts

standby: 19 milliamps  
typical: 360 milliamps

- Environmental requirements

operating temperature: 40 to 122 degrees F (5 to 50 degrees C)  
storage temperature: -40 to 140 degrees F (-40 to 60 degrees C) with no condensation  
relative humidity: 5% to 90% with maximum wet bulb temperature of 85 degrees F (29 degrees C) and no condensation

- Weight and dimensions

height: 2.01 in. (51 mm)  
width: 4.72 in (120 mm)  
depth: 7.87 in. (200 mm)  
weight: 2.8 lb. (1.3 kg)

## Apple 5.25 Drive: Specifications

Revised: 7/11/94  
Security: Everyone

Apple 5.25 Drive: Specifications

=====

Article Created: 31 May 1991  
Article Reviewed/Updated: 11 July 1994

TOPIC -----

This article describes the Apple 5.25 Drive.

DISCUSSION -----

The Apple 5.25 Drive is ideal for users who need compatibility with thousands of Apple II software programs.

The unit adds 143K of on-line storage to an Apple II system. You can further increase storage capacity by connecting an additional drive directly to it. Depending on which computer system you have, you may be able to "daisy chain" several drives (including 3.5-inch drives) in this manner.

### System Requirements

-----

The Apple 5.25 Drive can be used with any Apple II personal computer:

- Apple IIGS
- Apple IIe\*
- Apple IIc Plus
- Apple IIc
- Apple II Plus\*
- original Apple II\*

\* the Apple IIe, Apple II Plus, and Apple II require the Apple 5.25  
Controller Card

### Technical Specifications

- 
- Recording medium  
recording surfaces: 1  
tracks per surface: 35

- Capacity  
Formatted data capacity: 143K, 16 sectors  
Available data capacity:
  - ProDOS or Pascal: 137K
  - DOS 3.3 (16 sectors): 124K
- Drive Characteristics  
Seek/settle time (track to track): 30 milliseconds maximum  
Drive-motor startup time: 500 milliseconds maximum  
Data transfer rate: 250 KBytes/second  
Disk rotational speed: 299 RPM  
Seek/settle time (track to track): 30 milliseconds max.  
Drive motor start time: 500 milliseconds max.  
Number of read/write heads: 1  
Head positioning:
  - Adjusted to a tolerance of 0.002 inches maximum deviation from ideal on trackTracks per surface: 35  
Tracks per inch: 48  
Data surfaces: 1
- Power consumption  
+12 ( $\pm 0.6$ ) volts DC  
    typical: 800 milliamps  
    maximum: 1.6 amps  
  
-12( $\pm 0.6$ ) volts DC  
    typical: 10 milliamps  
    maximum: 20 milliamps  
  
+5( $\pm 0.25$ ) volts DC  
    typical: 200 milliamps  
    maximum: 400 milliamps
- Head Positioning  
Adjusted to  $\pm 0.002$  inches maximum deviation from ideal on track
- Interfaces  
one built-in cable with 19-pin D-style plug
  - Plugs directly into the disk drive port of an Apple IIGS, Apple IIc Plus, or Apple IIc.
  - Plugs into the Apple 5.25 Controller Card installed in an Apple IIe, Apple II Plus, or Apple II.one 19-pin D-style jack for connection of additional drive
- System Configuration
  - Replaces UniDisk as standard floppy disk drive
  - Can be "daisy chained" or connected to the back of another drive using the disk drive port of the Apple IIGS, the disk drive port of the Apple IIc, or using UniDisk controller card in the Apple II series computers Apple II, Apple II Plus, Apple IIe, or Apple IIGS.

# ..TIL07886-Apple\_5-25\_Drive-Specifications.pdf

- Environmental requirements  
operating temperature: 50 to 105 degrees F (10 to 46 degrees C)  
operating humidity: 20% to 80% (noncondensing)  
maximum wet bulb temperature: 85 degrees F (29.4 degrees C)
- Dimensions and Weight  
height: 3.13 in. (7.96 cm)

## Access II: Specifications (Discontinued)

Revised: 10/7/93  
Security: Everyone

Access II: Specifications (Discontinued)

Article Created: 31 May 1991

TOPIC -----

This article describes Apple Access II communication software.

DISCUSSION -----

Overview

-----  
Apple Access II provides intelligent and easy-to-use terminal software to Apple II users. It uses the power of the computer for automatic communications and full disk support, including file transfer. Apple Access II incorporates the AppleWorks user interface, making its operation is clear and easy to understand.

Apple Access II allows the user to send and receive any type of ProDOS file via modem. Apple Access II supports all features of Apple Modems, including automatic dialing of telephone numbers. In addition, it allows users to automatically log on to remote computers. Procedures for automatic log-on to Dow Jones, CompuServe, and the Source are included on the disk.

Apple Access II can be used with any modem that operates through an RS-232 port, or by direct connection to another computer. The software supports speeds up to 9600 baud. (It does not support split speeds, modems that send at one rate and receive at another.) Apple Access II provides complete TTY, ANSI (VT100), and VT52 terminal emulation for advanced users (less graphics).

A training disk, included with the software, allows users of all levels of proficiency to see results quickly. The Reference Manual explains introductory as well as advanced concepts of telecommunications.

Equipment Requirements

-----

Apple Access II requires:

- either an Apple IIc, or an Apple IIe with 64K RAM and a Super Serial Card in Slot 2
- either a disk drive, or RS-232 (Serial) connection to either a modem or to another computer or terminal

Apple Access II does not work with the following equipment:

- Apple II or Apple II Plus
- Apple III in Apple II emulation mode
- Any modem for the Apple IIe that comes with its own interface card.

Security: Everyone

Apple II Monochrome Monitors: Specifications (Discontinued)

Article Created: 31 May 1991

TOPIC -----

This article describes two Apple II Monochrome Monitors:

- the Apple Monochrome Monitor (for the Apple IIGS, Apple IIc Plus, or Apple IIc)
- the Apple Monochrome Monitor IIe (for the Apple IIe, Apple II Plus, or Apple II)

DISCUSSION -----

Both these monitors display crisp, easy-to-read text and sharp graphics. Their 12 inch high-resolution antiglare screens are easy on your eyes, making them the low-cost displays of choice for text-based applications and other applications that don't require color.

### System Requirements

- To use an Apple Monochrome Monitor IIe, you need an Apple IIe, Apple II Plus, or Apple II personal computer.
- To use an Apple Monochrome monitor, you need an Apple IIGS, Apple IIc Plus, or Apple IIc personal computer. If you have an Apple IIc Plus or Apple IIc, you may also wish to purchase an Apple Monitor Stand.

### Picture Tube

- Apple Monochrome Monitor IIe  
12 inches (30.5 centimeters) diagonal  
High-contrast  
Antiglare  
90 degrees diagonal deflection  
Green Phosphor (EIA Type P31)

- Apple Monochrome Monitor  
12 inches (30.5 centimeters) diagonal  
High-contrast  
Antiglare  
90 degrees diagonal deflection  
White Phosphor (EIA Type P4)

#### Active Display Area

- both monitors:  
215mm horizontal by 160mm vertical (remainder of area is used for border)

#### Scanning

- both monitors:  
EIA standard: 525 lines; 30 frames, 60 fields/second; overscan

#### Scan Rates

- both monitors:  
Horizontal: 15.7 kilohertz  
Vertical: 59.9 hertz

#### Input Signal

- both monitors:  
Composite video, 1.0 ( $\pm 0.1$ ) volts peak-to-peak, negative sync

#### Video Bandwidth

- both monitors:  
Less than 3 decibels down at 10 megahertz

#### Display Capability

- Apple Monochrome Monitor IIe  
With Apple IIe: 560 dots horizontally by 192 dots vertically
- Apple Monochrome Monitor  
With Apple IIc Plus or Apple IIc: 560 dots horiz. by 192 dots vert.  
With Apple IIGS: 640 dots horizontally by 200 dots vertically

#### Text display

- both monitors: up to 80 columns by 25 lines

#### Horizontal linearity

- both monitors: less than 10%

#### Vertical linearity

- both monitors: less than 7%

#### Video Input Connector

- both monitors: RCA-style phone jack (75 ohm)

#### Controls

- Apple Monochrome Monitor IIe  
Front: power on/off, contrast  
Rear: brightness, vertical hold, height
- Apple Monochrome Monitor  
Side: power on/off, contrast  
Rear: brightness, vertical hold, vertical amplitude

#### Electrical Requirements

- both monitors:  
Line voltage 108 to 132 volts AC  
Frequency 50 to 60 hertz  
Power consumption  
Typically less than 20 watts  
Maximum 45 watts

#### Environmental requirements

- Apple Monochrome Monitor IIe  
Operating temperature: 41 to 104 degrees F (5 to 40 degrees C)  
Maximum humidity: 90%  
Altitude: 0 to 10,000 ft. (0 to 3,048 m)
- Apple Monochrome Monitor  
Operating temperature: 32 to 122 degrees F (0 to 5 degrees C)  
Maximum humidity: 90%  
Altitude: 0 to 10,000 ft. (0 to 3,048 m)

#### Dimensions

- Apple Monochrome Monitor IIe  
Height: 10.63 in. (27.0 cm)  
Width: 14.56 in. (37.0 cm)  
Depth: 12.50 in (31.8 cm)  
Weight: 18 lbs. (8.16 kg)
- Apple Monochrome Monitor  
Height: 10 in. (25.5 cm)  
Width: 12.3 in. (31.0 cm)  
Depth: 14.3 in (37.5 cm)  
Weight: 18 lbs. (8.16 kg)

## Apple IIGS (1MB, ROM 03): Specifications (Discontinued 12/92)

Revised: 9/13/93  
Security: Everyone

Apple IIGS (1MB, ROM 03): Specifications (Discontinued 12/92)

Article Created: 31 May 1991

TOPIC -----

This article describes the Apple IIGS personal computer model with 1MB of RAM and ROM version 03.

DISCUSSION -----

### OVERVIEW

-----  
The Apple IIGS combines the best of the previous Apple II computers: built-in accessory ports for easy addition of peripherals, as well as versatile expansion slots for system customization. The Apple IIGS also provides an easy-to-use interface similar to that of the Macintosh personal computer. It also offers powerful features such as high-resolution color graphics, 15-voice sound capability, and the advanced 65C816 microprocessor.

The Apple IIGS features GS/OS, an operating system developed exclusively to take advantage of the computer's hardware features. GS/OS offers high-performance capabilities such as rapid disk access and program launching, while increasing the system's ease of use.

### SYSTEM SOFTWARE

-----  
The Apple IIGS Personal computer features Version 5.0.4 of Apple IIGS System Software, including the following:

- GS/OS Operating System. Exclusively created for the Apple IIGS personal computer, GS/OS dramatically increases the speed of both disk access and program launching. It also includes File System Translators (FSTs) that allow applications to directly access files created using other file systems, such as the ISO/High Sierra file system used by CD-ROM devices.

- Finder. The Apple IIGS Finder has been revised extensively to take full advantage of the GS/OS operation system. In addition to providing support for disk partitions and other new features, the Apple IIGS Finder is easier to use, faster, and more informative than the earlier version. The Finder also supports the AppleShare File Server, allowing you to share program files and data with other AppleShare users.
- Advanced Disk Utility. With its graphics-based interface, the Advanced Disk Utility makes it easy to initialize, name, erase, and partition hard disks, as well as to work with both 5.25- and 3.5-inch floppy disks.
- Installer. This program allows you to update your startup disks with the latest system software. It also lets you add special system files to customize startup disks for use with your particular system configuration.

#### TECHNICAL SPECIFICATIONS

##### Central Processing Unit (CPU)

Microprocessor: 65C816  
Clock speed: 2.8 or 1.02 megahertz; user- or software selectable  
Address bus: 24 bits  
Data bus: 8 bits  
Address range: 16,777,216 bytes  
16-bit registers: accumulator, two index registers, direct register, stack pointer, and program counter  
8-bit registers: data bank, status  
Addressable memory: up to 8MB of ROM

##### Memory

1MB RAM, expandable to 8MB  
256K ROM, expandable to 1MB (ROM revision 03)

##### Text Display Modes

40 columns by 24 lines  
80 columns by 24 lines

##### Graphics Display Modes

###### Super-high-resolution:

- 320 dots horizontally by 200 dots vertically, in up to 16 colors per screen, from a palette of 4,069 colors
- 640 dots horizontally by 200 dots vertically, in 4 or more colors per line and 128 colors per screen from a palette of 4,096 colors.

Double-high-resolution (560 dots horizontally by 192 dots vertically; 16 colors)

Double-low-resolution (80 dots horizontally by 48 dots vertically; 6 colors)

High-resolution (280 dots horizontally by 192 dots vertically; 6 colors)

Low-resolution (40 dots horizontally by 48 dots vertically; 16 colors)

#### Sound Capability

-----

An Ensoniq 32-oscillator digital synthesizer chip with dedicated 64K RAM:

- produces up to 15 voices simultaneously.
- uses external speaker or headphones via audio output jack (volume is set through the Control Panel).

#### Character Sets

-----

32 letters (uppercase and lowercase), 32 special characters, 32 MouseText characters, and 12 unique characters for each of these international character sets: U.S., U.K., French, Danish, Spanish, Italian, German, and Swedish.

#### Keyboard

-----

- Standard typewriter-style
- 80 keys, plus 14 key numeric keypad
- Two Apple Desktop Bus (ADB) connectors (one for attaching the keyboard to the computer; one for daisy-chaining additional input devices)
- Keyboard layouts, selectable through the Control Panel:
  - QWERTY (Sholes)
  - Dvorak
  - Nine international (all those listed under Character Sets, plus French Canadian)

#### Interfaces

-----

- One multipurpose RAM/ROM memory expansion slot
- Seven general-purpose input/output slots for peripherals control cards, all fully buffered, with interrupt and DMA priority
- Serial ports: two 8-pin minicircular connectors (either can be used to connect AppleTalk devices); utilize SCC communications chip
- Disk drive port: one 19-pin D-style connector (allows daisy-chain connection of up to four Apple 3.5, Apple 5.25, or UniDisk disk drives)
- Video output
  - Analog RGB, via 15-pin D-style connector
  - Composite color, via RCA phone connector
- Apple Desktop Bus port; one 4-pin mini-circular connector on back of computer
- Game I/O: 9-pin D-style connector for joysticks, graphics tablet, and similar devices
- Audio
  - RCA mini headphone/speaker output jack with programmable volume control
  - Input/Output connector on main logic board

#### Operating Systems Supported

- GS/OS
- ProDOS 16 and ProDOS 8
- Pascal
- DOS 3.3
- CP/M (with appropriate co-processor card)

#### Other Features

- Real-time clock (set through Control Panel)
- Battery backup for Control Panel settings

#### Electrical Requirements

- Line voltage: 107 to 132 volts AC; 50 to 60 hertz
- Power consumption:  
Typical: 11 watts  
Maximum: 60 watts
- Supply voltages:  
+5 volts ( $\pm 3\%$ )  
+12 volts ( $\pm 6\%$ )  
-5 volts ( $\pm 10\%$ )  
-12 volts ( $\pm 10\%$ )
- Maximum supply currents:  
+5 volts: 2.5 amps  
+12 volts: 1.5 amps  
-5 volts: 250 milliamps  
+12 volts: 250 milliamps

#### Environmental Requirements

- Operating temperature: 32 to 113 degrees F (0 to 45 degrees C)
- Maximum temperature on power supply case: 130 degrees F (55 degrees C)
- Relative humidity: 5% to 85%

#### Safety and EMI Qualifications

- FCC Part 15 Class B Computing Devices
- CSA 22.2, NO. 154-1979
- UL 114 - Office Appliances and Business Equipment

#### Dimensions and Weight (main unit only)

- Height: 4.6 in. (11.7 cm)
- Width: 11.2 in (28.4 cm)
- Depth: 13.7 in. (34.8 cm)
- Weight: 8.72 lb. (3.96 kg)

## Apple IIGS: System Fan (2/97)

Revised: 2/18/97  
Security: Everyone

Apple IIGS: System Fan (2/97)

=====

Article Created: 31 July 1991  
Article Reviewed/Updated: 17 February 1997

TOPIC -----

Why does the Apple IIGS need a fan?

DISCUSSION -----

If your Apple IIGS has three or more expansion cards, they can cause a noticeable buildup of heat inside the computer. The Apple IIGS System Fan maintains the proper internal case temperature under these conditions, prolonging the life of your computer's components.

This fan is not compatible with the Apple IIGS Upgrade for Apple IIe computers.

## Aristotle: Specifications (Discontinued)

Revised: 6/1/94  
Security: Everyone

Aristotle: Specifications (Discontinued)

=====

Article Created: 31 May 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

What is Aristotle?

DISCUSSION -----

Overview

-----

Aristotle is a software package designed especially for schools. It gives student and teachers individual Apple II workstations fast and easy access to ProDOS application programs stored on a AppleShare file server.

Aristotle consists of two interrelated programs: menu display and menu management. The menu display program presents students and teachers with menus that list teacher names, the classes they teach, and the application programs available for each class. The menu management program allows teachers or network administrators to tailor the menus, including which applications will be available for each user.

System Requirements

-----

A 3.5- inch disk drive is required to load the Aristotle software onto the AppleShare file server, but is not required after that.

To use the menu management program of Aristotle, you need a LocalTalk Locking Connector Kit, plus one of the following systems:

- an Apple IIGS system with ROM 03, or an Apple IIGS system with ROM 01 and a Memory Expansion Card.
- an enhanced Apple IIe computer with an AppleMouse IIe, Apple II

## ..TIL07891-Aristotle-Specifications\_Discontinued.pdf

Workstation Card, and an Apple IIe Memory Expansion Card (256K minimum)

To use the menu display program of Aristotle, you need a LocalTalk Locking Connector Kit, plus one of the following systems:

- an enhanced Apple IIe with 128K of RAM and an Apple II Workstation Card (with AppleShare IIe Workstation installer disk).
- an Apple IIGS with a total of 768K RAM (256K on the main logic board and 512K on an Apple IIGS Memory Expansion Card), and AppleShare IIGS Workstation Software for your AppleShare file server.

## Apple II High-Speed SCSI Card: Description (11/96)

Revised: 11/21/96  
Security: Everyone

Apple II High-Speed SCSI Card: Description (11/96)

Article Created: 31 May 1991  
Article Reviewed/Updated: 14 November 1996

TOPIC -----

This article describes the Apple II High-Speed SCSI Card. This card has been discontinued and is no longer available from Apple.

DISCUSSION -----

### Overview

-----  
The Apple II High-Speed SCSI Card lets you connect an Apple IIe or Apple IIGS computer to any device using the SCSI standard. Such devices include hard disk drives, CD-ROM drives, scanners, tape drives, and laser printers. Using DMA (direct memory access) data transfer, this card offers impressive data throughput. It functions more than 10 times faster than the earlier Apple II SCSI Card. The Apple II High-Speed SCSI Card comes with software utilities for use with hard disk drives and CD-ROM drives.

### System Requirements

-----  
To use the Apple II High-Speed SCSI Card, you need an Apple IIGS or Apple IIe computer with a 65C02 microprocessor. This includes all Apple IIe systems manufactured in 1986 or later, as well as any earlier models that have been enhanced with the Apple IIe Enhancement Kit. If you have an early-model Apple IIe that has not been enhanced, contact your dealer about the enhancement kit.)

A 3.5-inch disk drive (Apple IIGS or Apple IIe) or a 5.25-inch disk drive (Apple IIe)

A device with an SCSI port, appropriate SCSI cabling, and one SCSI terminator.

### Technical Specifications

-----

Interface: DB-25 SCSI port

Maximum data throughput

- 1MB per second (Apple IIGS)
- 511K per second (Apple IIe)

Environmental requirements

- Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)
- Relative humidity: 20% to 95% (noncondensing)

## HyperCard IIGS: Specifications

Revised: 7/15/91  
Security: Everyone

HyperCard IIGS: Specifications

=====  
Article Created: 31 May 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

This article describes HyperCard IIGS.

DISCUSSION -----

Overview

-----

HyperCard for the Apple IIGS personal computer lets users create a custom environment for exploring and managing information. Because of its flexibility, HyperCard IIGS can be used in an almost unlimited number of ways, for example:

- to manage personal information,
- to create interactive multimedia presentations and tutorials, and
- to build interfaces to on-line information services.

Like HyperCard for the Macintosh, HyperCard IIGS is based on a universal tool for storing information: the index card. But in HyperCard IIGS, index cards can contain information not only in text form, but as photographs, graphics, video, and sound as well.

HyperCard "buttons" (active areas on a card) give you the freedom to work with information at your own pace and in the order you prefer. When you point to a button and click with the mouse, the computer carries out a specific task. For example, it will move to another card so you can explore a related subject, define a term you don't understand, control a video from a laser videodisc player, prompt you for further information, or run another computer program.

HyperCard IIGS can work for beginners right away. HyperCard IIGS comes with ready-to-use stacks for storing personal information, creating

stories, and more. You can also use HyperCard IIGS to run commercially available stacks, including stacks originally created for Macintosh computers that have been converted for Apple IIGS use.

HyperCard IIGS also offers easy ways to create your own stacks. You can create and edit buttons and fields, create artwork with the full-color Paint Tools, and create advanced HyperCard programs using HyperTalk (HyperCard's powerful English-like scripting language).

As an expansion of the HyperCard line of software for Macintosh computers, HyperCard for the Apple IIGS is the ideal tool for all who want to work with information more effectively, and those with special knowledge, talents, or experience that they want to share with others.

## User Levels

-----

HyperCard IIGS provides five distinct user levels: Browsing, Typing, Painting, Authoring, and Scripting. Each user level includes all the features of the level before it.

- Browsing  
Use stacks (but not alter stacks)
- Typing  
Enter and edit text in fields  
Create and delete cards
- Painting  
Draw transparent or opaque graphics  
Draw shapes  
Draw with different brushes  
Magnify image 8 times for "fat bits" editing  
Rotate, Flip, or Stretch images  
Select the last object drawn  
Choose ColorSet for Card, background, and stack  
Import ColorSet for card and background  
Import and export graphics from and to other files
- Authoring  
Create, delete, and change styles of fields and buttons  
Create links to other cards and stacks
- Scripting (HyperTalk scripting language)  
Object-oriented message passing  
Any button, field, card, background, or stack can have a script.  
Each script can have any number of "handlers" for messages generated by the system or the user.  
Edit any script  
Search or print a script  
Full-screen script editor with automatic formatting  
Maximum script length: 30,000 characters

## System Requirements

-----

To use HyperCard IIGS, you need the following:

- an Apple IIGS computer with a minimum of 1.5MB of RAM (2MB is recommended)
- an 800K floppy disk drive, plus either a hard disk or a network environment
- System software version 5.0.4 or later

To convert stacks that have been created using Macintosh HyperCard 1.2.2 or 1.2.5 for use with HyperCard IIGS, you need access to a Macintosh personal computer and the HyperMover program.

## Technical Specifications

-----

- Number of cards per stack: limited only by available disk or file-server storage.
- Maximum stack size: up to 512MB, depending on available disk or file-server storage
- Card Size: 640 horizontal pixels by 200 vertical lines (the size of an Apple IIGS screen)
- Graphics: color bitmaps with opaque and transparent areas
- Number of text fields per card: limited only by available memory and disk space
- Maximum amount of text per field: 30,000 characters
- Number of buttons and links per card: limited only by available memory and disk space
- Number of active variables: limited only by available memory
- Control structures
  - Repeat until condition
  - Repeat with loop counter
  - If/then/else conditionals
  - Exit loop or procedure
  - Pass message/send message
- Data types
  - Conversion to SANE numerics (9-place accuracy)
  - Conversion to date and time
- Variables
  - Contents of any field
  - Dynamically created local variables
  - Global variables

## IIGS Memory Expansion Card: Description (11/96)

Revised: 11/21/96  
Security: Everyone

IIGS Memory Expansion Card: Description (11/96)

Article Created: 31 May 1991  
Article Reviewed/Updated: 19 November 1996

TOPIC -----

This article describes the Apple IIGS Memory Expansion Card.

DISCUSSION -----

### Overview

-----  
The Apple IIGS Memory Expansion Card gives your computer the internal memory needed to run sophisticated applications, and gives complete access to the advanced capabilities of the Apple IIGS.

Although the 256K of RAM resident in the computer already lets you keep large documents and many applications close at hand, the Memory Expansion Card will hold even larger files and programs, further reducing time-consuming disk access.

The Apple IIGS Memory Expansion Card adds up to a full megabyte (1MB) of RAM to the computer, in 256K increments. This means the total RAM in your system can be as high as 1.25MB with ROM 01, or 2MB with ROM 03. You can configure and install the card yourself, and increase its capacity at any time.

### System Requirements

-----  
To use the Apple IIGS Memory Expansion Card, you need an Apple IIGS or an Apple IIe with the Apple IIGS Upgrade installed. (This card is not compatible with other computers in the Apple II family.)

### Technical Specifications

-----  
Electrical:

# ..TIL07894-IIIGS\_Memory\_Expansion\_Card-Description\_11-96.pdf

Voltage requirements: 4.75 to 5.25 volts DC Power consumption

Operation: 200 milliamps in 256K configuration  
600 milliamps in 1MB configuration

Standby: 140 milliamps in 256K configuration  
370 milliamps in 1MB configuration.

## Environmental requirements

- Ambient temperature: 50 to 104 degrees F (10 to 40 degrees C)
- Relative humidity: 10% to 95% (non condensing)

## Super Serial Card: Description (12/96)

Revised: 12/18/96  
Security: Everyone

Super Serial Card: Description (12/96)

=====

Article Created: 15 July 1991  
Article Reviewed/Updated: 16 December 1996

TOPIC -----

This article describes the Super Serial Interface Card.

DISCUSSION -----

### Overview

-----

The Apple II Super Serial Card provides a configurable RS 232 interface, allowing an Apple II, Apple II Plus, or Apple IIe computer to exchange data with other computers, modems, printers, terminals, and accessories employing a bidirectional RS-232-C interface in serial format (one bit at a time).

The Super Serial Card features an on-board switch allowing the operation of a printer, modem, or other serial device. This switch also eliminates the need for special connection cables such as modem eliminators.

### System Requirements

-----

To use the Apple II Super Serial Card, you need:

- \* an Apple II, Apple II Plus, or Apple IIe computer system with an available expansion slot; and
- \* a printer, modem, or other serial device.

### Technical Specifications

- 
- \* Single Level: EIA RS-232-C
  - \* Connector Type: DB-25 socket
  - \* On-Board ROM: 2K x 8 bit (2316 or equivalent)
  - \* ACIA: S6551 or equivalent
  - \* Baud Rate Selection: via on-board DIP switches (default) or via software

commands

- \* Data word format: 1 start bit, 1 or 2 stop bits, 7 or 8 data bits; odd, even, or no parity
- \* Available baud rates: 50, 79, 110, 134.6, 150, 300, 600, 1200, 1800, 2400, 3400, 9600, 19200
- \* RS-232-C Signals Supported: RTS (Request to Send), CTS (Clear to Send), DTR (Data Terminal Ready), DSR (Data Set Ready), DCD (Data Carrier Detect), RXD (Receive Data), TXD (Transmit Data), (SG) Signal Ground.

Internal Cable Pinout

-----

| 10 Pin<br>Connector | 25 Pin<br>Connector | Signal Name           |
|---------------------|---------------------|-----------------------|
| pin 1               | pin 1               | Frame Ground          |
| pin 2               | pin 2               | Transmit Data         |
| pin 3               | pin 3               | Receive Data          |
| pin 4               | pin 4               | Request to Send (RTS) |
| pin 5               | pin 5               | Clear to Send (CTS)   |
| pin 6               | pin 6               | Data Set Ready (DSR)  |
| pin 7               | pin 19              | Secondary CTS         |
| pin 8               | pin 7               | Signal Ground         |
| pin 9               | pin 20              | Data Terminal Ready   |
| pin 10              | pin 8               | Data Carrier Detect   |

Pin Explanation

-----

FRAME GROUND: Provides electrical connection to give both devices connected a common frame ground. Usually tied to Signal Ground inside the cabinet of one of the devices.

TRANSMIT DATA: This pin conveys serial data sent from the Super Serial card. This is one of the pins that may need to be crossed over if the peripheral device is a DTE. The MODEM/TERM plug can perform this crossover.

RECEIVE DATA: This pin receives serial data sent from the device the Super Serial card connects the computer to. This is one of the pins that may need to be crossed over if the peripheral device is a DTE. The MODEM/TERM plug can perform this crossover.

REQUEST TO SEND (RTS): This signal is used by the computer to ask the peripheral device if it is ready to receive computer data. Often a device such as a printer will ignore this signal (will not have a pin connected to it) because the signals primary use is to control half duplex modems.

CLEAR TO SEND (CTS): This pin receives the peripheral's ready to receive data response to an RTS from the computer. Again this pin is used most often by modems.

DATA SET READY (DSR): This pin receives the signal generated by the peripheral that indicates that the peripheral is turned on and ready to communicate. This

is one of the pins that may need to be crossed over if the peripheral device is a DTE. The MODEM/TERM plug can perform this crossover.

SECONDARY CTS: Some modems can transmit and receive on two channels (that is two separate communications on the same line). The Secondary CTS pin would be used to receive the peripheral's ready to receive data response to an RTS for the second channel from the computer.

SIGNAL GROUND: When this pin is connected between two RS232 devices it provides a common electrical level that the devices can reference the RS232 signals to.

DATA TERMINAL READY: This pin becomes active when the computer and SSC are ready to go on line. This is one of the pins that may need to be crossed over if the peripheral device is a DTE. The MODEM/TERM plug can perform this crossover. Also this pin can be used for flow control protocol handshaking.

DATA CARRIER DETECT: This pin receives the signal generated by a modem when it senses a carrier on the telephone line. The SSC would then respond by telling the computer that data was going to be coming from the modem.

#### Jumper Block

-----  
The jumper block has two positions, Terminal and Modem. The jumper block eliminates the need for special connection cables such as modem eliminators.

#### Switches

-----  
The fourteen switches, split into two banks named SW1 and SW2, are diagonally opposite the slot contacts. Holding the card so that the switches are at the top left, the two banks are arranged like this:

|                   |                   |
|-------------------|-------------------|
| SW1 1 2 3 4 5 6 7 | SW2 1 2 3 4 5 6 7 |
| ON                | ON                |
| OFF               | OFF               |

The markings SW1, SW2, ON, and OFF may not appear exactly as shown. If the lever on a switch is pointing towards the top of the card, the switch's contact is closed and the switch is ON. Use a sharp but soft point, like a pencil point, to move the levers.

#### Switch 1

|            | 1  | 2   | 3   | 4   |
|------------|----|-----|-----|-----|
| Baud Rate: |    |     |     |     |
| 50         | On | On  | On  | Off |
| 75         | On | On  | Off | On  |
| 110        | On | On  | Off | Off |
| 135        | On | Off | On  | On  |
| 150        | On | Off | On  | Off |
| 300        | On | Off | Off | On  |

|       |     |     |     |     |
|-------|-----|-----|-----|-----|
| 600   | On  | Off | Off | Off |
| 1200  | Off | On  | On  | On  |
| 1800  | Off | On  | On  | Off |
| 2400  | Off | On  | Off | On  |
| 3600  | Off | On  | Off | Off |
| 4800  | Off | Off | On  | On  |
| 7200  | Off | Off | On  | Off |
| 9600  | Off | Off | Off | On  |
| 19200 | Off | Off | Off | Off |

Switch 2

5 6

Auto linefeed after CR:

|          |     |
|----------|-----|
| Enabled  | On  |
| Disabled | Off |

Passage of interrupts from ACIA to CPU:

|          |     |
|----------|-----|
| Enabled  | On  |
| Disabled | Off |

Mode Switches

-----

The setting of the Mode switches (SW1 5 and 6) determines the function of the remaining switches in one of two modes, Communications mode or Printer Mode. Printer Mode includes two modes for printer PROM emulation.

Switch 1

5 6

Mode:

|                   |     |     |
|-------------------|-----|-----|
| Communications    | On  | On  |
| Printer           | Off | On  |
| SIC P8 Emulation  | On  | Off |
| SIC P8A Emulation | Off | Off |

Communications Mode

-----

The remaining switches have the following functions:

Switches SW1-7 and SW2-7

SW1 7 SW2 7

Protocol:

|         |    |     |
|---------|----|-----|
| RS-232C | On | Off |
|---------|----|-----|

Switches SW2-1, SW2-2, SW2-3, SW2-4

SW2 1 2 3 4

Data format:

|               |     |     |
|---------------|-----|-----|
| 8 data/1 stop | On  | On  |
| 7 data/1 stop | On  | Off |
| 8 data/2 stop | Off | On  |
| 7 data/2 stop | Off | Off |

Parity:

|      |     |     |
|------|-----|-----|
| None | N/A | On  |
| Odd  | On  | Off |
| Even | Off | Off |

Printer and Printer PROM Emulation Mode

-----  
The remaining switches have the following functions:

Switches SW1-7 and SW2-7

| SW1 | 7 | SW2 | 7 |
|-----|---|-----|---|
|-----|---|-----|---|

Protocol:

|                                |     |     |
|--------------------------------|-----|-----|
| Normal Clear to Send (RS-232C) | On  | Off |
| Secondary Clear to Send        | Off | On  |

Switches SW2-1, SW2-2, SW2-3, SW2-4

| SW2 | 1 | 2 | 3 | 4 |
|-----|---|---|---|---|
|-----|---|---|---|---|

Data format:

|               |     |
|---------------|-----|
| 8 data/1 stop | On  |
| 8 data/2 stop | Off |

Delay after carriage return:

|                 |     |
|-----------------|-----|
| 32 milliseconds | On  |
| None            | Off |

Line Width (Printer mode has no parity):

|     |     |     |
|-----|-----|-----|
| 40  | On  | On  |
| 72  | On  | Off |
| 80  | On  | Off |
| 132 | Off | Off |

Important Information

-----  
There is a problem with using the Super Serial Card (SSC) terminal firmware at 1200 baud on an unenhanced IIe. The IIe 80-column card can't keep up with the data stream and eventually loses characters. Avoid this problem with faster, more sophisticated programs that can handle interrupts, such as Access II or third party terminal software. The proper terminal software also will allow use of the Extended Text Card with a modem at 1200 baud.

Apple IIGS System Software Version 5.0.4: Specifications

=====

Article Created: 31 May 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

This article describes Apple IIGS System Software Version 5.0.4.

DISCUSSION -----

Overview

-----

Apple IIGS System Software Version 5.0.4 gives you all the advantages of the latest system software for the Apple IIGS personal computer. It features GS/OS, an operating system that improves the startup time and speeds up disk access, program launching, and file copy and transfer tasks.

GS/OS includes File System Translators (FSTs), which enable applications to directly access files created using other file systems. For example, the ISO/High Sierra FST allows you to run CD-ROM applications that follow the ISO/High Sierra standard, and the AppleShare FST gives you access to files on AppleShare file servers.

Apple IIGS System Software Version 5.0.4 also offers several features that significantly improve the computer's functionality and ease of use.

The Finder (a graphics-based interface that allows you to manipulate files on the desktop) is now easier to use, faster, and more informative than earlier versions. It has also been revised to allow access to the AppleTalk Network System, so you can share programs and data located on an AppleShare file server, as well as networked printers, with other AppleShare users.

Another important feature is the new graphics-based Control Panel, which you access from the Finder via the Apple menu. You can use the Control

Panel to set the time and date; raise or lower the sound volume; log on to network servers; configure slot assignments; and change the colors of screen borders, background, and text.

Version 5.0.4 includes the Advanced Disk Utility, which features an easy-to-use graphics-based interface and allows you to initialize, erase, and partition hard disks, as well as both 5.25- and 3.5-inch floppy disks. You also get the Installer utility, which lets you update your startup disks and customize their configuration for your system and its attached peripherals.

## System Requirements

-----

To use Apple IIGS System Software Version 5.0.4, you need an Apple IIGS computer with:

- at least 1MB of RAM
- ROM Version 01,03
- at least one 800K 3.5-inch disk drive

## X Windows for A/UX: Where To Get xmh (9/94)

Revised: 9/14/94  
Security: Everyone

X Windows for A/UX: Where To Get "xmh" (9/94)

=====

Article Created: 5 March 1991  
Article Last Reviewed: 13 September 1994

TOPIC -----

Where I can get a copy of xmh? It is part of the MIT X11R4 Windows distribution, but I have noticed that this item is absent from Apple's X Windows for A/UX product.

DISCUSSION -----

As you may have noticed from the "Getting started with X Window System for A/UX" documentation, only the "display server" and "xstdcmap" client applications are from X11R4. Other client applications, such as the programmer libraries and the X toolkit, are still from X11R3. Since "xmh" is from X11R4 client applications, it is not included in our current release of X Window System for A/UX.

Apple's "X Window System 2.1 for A/UX" product includes xman, but not xmh. xmh requires the "mh" mail handling tools that are not included in either X11 or A/UX.

To locate xmh, connect to ftp.uu.net on the internet.

## A/UX 2.0: AT&T LP Spooler and Macintosh IIfx IOP Problem (6/93)

Revised: 8/13/93  
Security: Everyone

A/UX 2.0: AT&T LP Spooler and Macintosh IIfx IOP Problem (6/93)

=====

Article Created: 25 January 1991  
Article Reviewed/Updated: 23 June 1993

TOPIC -----

On a Macintosh IIfx the "cancel" command under the AT&T Line Printer spooler system can't gracefully shut off the child process of "lpsched". Therefore, the remaining entries in the printer queue can't be printed. Eventually, this hangs the printer port (on a direct connected ImageWriter II). The problem only happens on the Macintosh IIfx. We suspect the problem is on the A/UX 2.0 Macintosh IIfx IOP serial driver tty settings.

DISCUSSION -----

As a workaround, the "Macintosh IIfx Serial Switch" Macintosh OS CDEV seems to work for A/UX 2.0, which lets Macintosh IIfx serial ports be set to be Macintosh IIfx IOP-"compatible" for applications that use printer or modem ports that don't operate properly.

The Macintosh IIfx "Serial Switch" is available on AppleLink, here is the path:

## Macintosh Portable: Set Internal SCSI Drive to ID 0

Revised: 7/29/92  
Security: Everyone

Macintosh Portable: Set Internal SCSI Drive to ID "0"

=====

Article Created: 17 July 1991  
Article Last Reviewed: 29 July 1992  
Article Last Updated:

TOPIC -----

Why does the Macintosh Portable internal hard drive need to be set to SCSI address "0"?

DISCUSSION -----

If the Macintosh Portable internal hard drive is set to a SCSI address other than "0", the Portable CDEV does not operate properly. The hard drive starts up, but the Portable CDEV does not display the "Minutes Until Automatic Sleep" option for the hard drive, and the function is disabled. This is like starting up the Macintosh Portable with no internal hard drive.

Jumpers E1, E2, and E3 on the Conner drives are used to set the SCSI address. They use a binary counting system with E1 the least significant bit. No jumpers across E1, E2, and E3 (the factory setting) sets the drive to SCSI address "0", which is the standard Conner SCSI ID system.

## DRAM: General Information

Revised: 9/11/92  
Security: Everyone

DRAM: General Information

=====

Article Created: 18 July 1991

Article Change History

-----

09/11/92 - REVIEWED

- For technical accuracy.

TOPIC -----

- 1) What information is stored in DRAM?
- 2) What happens to the information in DRAM when the Macintosh is turned off?
- 3) Is DRAM volatile?

DISCUSSION -----

- 1) DRAM is the memory used by the Macintosh to temporarily hold the information or data that the user is working on until it is saved to a hard disk, floppy disk, or another storage medium.
- 2) Once power is no longer supplied to RAM, the contents is lost. If a user is working on a Macintosh and turns the system off without saving the work, what was in DRAM during the work session will be lost. The data lost is the data that the user was working on before the power was removed.
- 3) Yes, DRAM is volatile. That's the nature of DRAM (Dynamic Random Access Memory); it needs to be constantly powered with electricity to remember its contents. The same applies to SRAM (Static Random Access Memory); however, SRAM does not need to be refreshed the way DRAM does, and this provides data retention for extended periods, which is why this type of RAM is used in Macintosh Portable computers.

Apple Ethernet NB Card: Power Consumption

=====

Article Created: 09 July 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

How much current does the Apple Ethernet NB Card draw?

DISCUSSION -----

The Apple Ethernet NB Card draws 3.96 watts at 5 volts. The recommended wattage limit for each NuBus slot is 13.9 watts.

The overall power-draw audit of the Ethernet NB Card (including power consumed by an external AAUI transceiver) is 1.165A.

AAUI cabling should not exceed 1.5m.

## LaserWriter Family: Toner Cartridge Compatibility

Revised: 8/2/95  
Security: Everyone

LaserWriter Family: Toner Cartridge Compatibility

Article Created: 09 July 1991  
Article Last Reviewed/Updated: 02 August 1995

TOPIC -----

Can Canon copier toner cartridges be used in the LaserWriter family of printers?

DISCUSSION -----

Toner cartridges made specifically for Canon copiers are not compatible with the LaserWriter, LaserWriter Plus, LaserWriter II, and Personal LaserWriter printers. Cartridges made for the Canon Laser Printer and Hewlett-Packard cartridges made for the HP LaserJet are compatible.

Here is a list of cartridge types for the LaserWriter printers:

| Printer<br>-----               | Cartridge Type<br>----- |
|--------------------------------|-------------------------|
| LaserWriter                    | EP                      |
| LaserWriter Plus               | EP                      |
| LaserWriter II Series          | EPS                     |
| Personal LaserWriter NT,NTR,LS | EP-L                    |
| Personal LaserWriter 300       | EP-P                    |
| LaserWriter Pro 600 Series     | EP-E                    |
| LaserWriter Pro 800 Series     | EP                      |

Apple does not recommend the use of refilled toner cartridges in the LaserWriter printers. For more information, search the Tech Info Library under "LaserWriter and Toner and Cartridge".

## Macintosh IIfx: 4MB SIMM Configuration (11/94)

Revised: 11/8/94  
Security: Everyone

Macintosh IIfx: 4MB SIMM Configuration (11/94)

Article Created: 25 July 1991  
Article Reviewed/Updated: 08 November 1994

TOPIC -----

I have a Macintosh IIfx with 4MB of RAM and a Macintosh Display Card 8•24 GC installed. When I add the 8•24 GC CDEV to the System Folder and try to start up the system, it hangs at the "Welcome to Macintosh" message. When I remove the 8•24 GC CDEV from the System Folder, the system starts up and operates normally. (This does not happen with a Macintosh IIfx with 8MB of RAM installed.)

DISCUSSION -----

This problem is peculiar to the Macintosh IIfx with 4MB of RAM installed. Apple states that, when using only 4MB of RAM in the Macintosh IIfx, the SIMMs MUST BE installed in bank A. Although the Macintosh IIfx may work normally in some configurations with the SIMMs installed in bank B; in others, it doesn't.

To eliminate the problems you are experiencing with the Macintosh IIfx, make sure the RAM SIMMs are in bank A.

## StyleWriter: HyperCard 2.X Card Printing Problem/Fix (12/94)

Revised: 12/5/94  
Security: Everyone

StyleWriter: HyperCard 2.X Card Printing Problem/Fix (12/94)

=====

Article Created: 25 July 1991  
Article Reviewed/Updated: 05 December 1994

TOPIC -----

Vertical lines do not align perfectly when printing to a StyleWriter from HyperCard 2.X using the "Print Card" option. This problem does not happen with horizontal lines or when using the "Print Stack" option.

Is this a known problem?

DISCUSSION -----

Yes, StyleWriter output has vertical-line registration problems when using the "Print Card" option in HyperCard 2.X.

Claris is aware of the issue and is investigating it. The registration problem is caused by the HyperCard printing code, not by the StyleWriter.

The registration problem can be avoided by using the "Mark Card" option:

- 1) Go to the card you want to print.
- 2) Display the "message box".
- 3) Type "Mark Card" into the message box and press either the Return or Enter key. Note that more than one card can be marked at a time.
- 4) Select "Print Stack" from the "File" menu.
- 5) Select the "Marked Cards" option.
- 6) Click the "Print" button.
- 7) Type "unMark Card" in the message box and press either the Return or Enter key. This unmarks the card so it doesn't print the next time.

this procedure is used.

## StyleWriter: How to Avoid Paper Jams

Revised: 7/30/91  
Security: Everyone

StyleWriter: How to Avoid Paper Jams

=====  
  
Article Created: 25 July 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Have there been any reported paper-jamming problems with the StyleWriter printers?

DISCUSSION -----

We haven't received any reports of paper-jamming problems with the StyleWriter printers.

The StyleWriter has a detachable cut-sheet feeder that easily connects to the printer. When the sheet feeder is connected properly, the product performs flawlessly. When attaching the sheet feeder, ensure that the sheet feeder is locked in place and that the paper support is installed; it's also important to press the release button on the sheet feeder to snap the paper panel forward for proper positioning. The sheet feeder holds up to 50 sheets of 20-pound paper and automatically feeds the paper while printing.

The StyleWriter can be used without the sheet feeder with front or rear manual feed. The front and rear manual-feed options simplify the printing of single-sheet paper, envelopes, labels, and transparencies.

### Paper-Feed Features

- 
- Detachable cut-sheet feeder accurately feeds up to 50 sheets automatically.
  - Rear manual-feed slot is ideal for printing materials like envelopes, labels, transparencies, and heavy paper.
  - Front manual-feed slot provides easy access for standard paper.

## LaserWriter: Print Engine Specifications (8/94)

Revised: 8/31/94  
Security: Everyone

LaserWriter: Print Engine Specifications (8/94)

Article Created: 30 July 1991  
Article Reviewed/Updated: 31 August 1994

TOPIC -----

What are the print quality standards for LaserWriter printers?

NOTE: This product has been discontinued and is no longer available.

DISCUSSION -----

The printing engine shall maintain these print quality standards:

Skew of Vertical Lines

-----  
Skew of vertical lines shall not exceed 1.5 mm over a 260-mm span (letter- size paper).

Horizontal Line Position Accuracy

-----  
A horizontal line shall be within 2 mm of the position specified by the printing software. The positions from the leading edge shall be measured in the middle of the sheet to avoid the effects of paper skew. Horizontal line position shall be (repeatably) +/-1 mm, page-to-page.

Vertical Line Position Accuracy

-----  
A vertical line shall be within 2 mm of the horizontal position specified by the printing software: +/-1 mm, page-to-page.

Print Quality Measurement Procedure

-----  
These test conditions must be used when measuring print quality:

- Use a freshly opened, recommended paper and an unopened toner cartridge.
- Allow the packaged cartridge and paper to stand in the environment for 2

hours minimum.

- Open both the cartridge and paper.
- Print 15 pages of horizontal lines, 5% coverage, before printing samples for measurement.
- Print 10 pages of various patterns for measurement.

#### Environmental Definition

- 17.5 to 25 degrees C
- 30 to 70% humidity

## Display Monitors and Geometric Distortion

Revised: 8/5/91  
Security: Everyone

Display Monitors and Geometric Distortion

=====  
Article Created: 30 July 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

This articles explains why computer display monitors experience geometric distortion, and describes some remedies.

DISCUSSION -----

General  
-----

The earth's magnetic field often distorts a monitor's visible raster, which is the lighted portion of the display. A monitor properly adjusted at the factory may appear significantly different when it is set up in its new environment. The raster may be tilted, off-center, or have areas of various forms of distortion such as "soft corners" or raster edges that may not be perfectly straight.

The influence of the earth's magnetic field is not peculiar to Apple monitors. All monitors are affected to some degree. The extent of the distortion depends on the location of the monitor. This can be demonstrated by moving the monitor to another location or by rotating it 90 degrees. The movement may either improve or worsen the shape and position of the raster. In most cases, the effects of the earth's magnetic field are primarily cosmetic. The active area of the screen, where work is actually performed, is still very usable.

Here are some tips to help you determine whether a monitor exhibiting geometric distortion needs to be repaired or is simply being influenced by some environmental interference.

Change Location  
-----

If your monitor has a distorted raster, move the monitor to another location and note any changes in the display. If the display changes when the monitor is moved or rotated, the monitor's environment is the source of the distortion. Servicing the monitor will make no difference.

#### Remove Metal Objects From the Area

-----

Operating a monitor near large metal objects such as desks, file cabinets, or bookshelves may worsen the problem. If possible, rearrange the work area so that large metal objects are as far from the monitor as possible.

#### Look for Other Environmental Influence

-----

If the raster jitters or has bars or lines in the display, this may indicate another type of environmental interference. If the monitor is close to another monitor, electrical appliance, or other units of electronic gear, turn off the power to the other unit(s) to see if the monitor returns to normal operation.

Fluorescent lighting fixtures are also common sources of external interference. The lights can arc internally (even though the lights don't flicker) and cause interference with the monitor. In these cases, turn off the lights momentarily to see if the display distortion stops.

#### How To Verify Environmental Interference as the Cause of Distortion

-----

The best way to verify environmental interference as the cause of the distortion is to remove the unit from the building and check for the same symptoms at another location. If the problem is intermittent, look for electric devices that operate intermittently. These include, but are not limited to, coffeemakers, copy machines, and refrigerators.

#### Caution

-----

You can compensate for some of the geometric distortions mentioned by performing various monitor adjustments. However, Apple does not recommend these "corrections." Remember that the monitor left the factory within specifications. Although a particular environment can distort a properly adjusted monitor, by adjusting the monitor to suit a particular environment, you are actually changing the monitor's correct factory settings. If the monitor is moved, or the environment in which it operates is changed (including everything from rearranging furniture to the construction of a nearby building), the resulting geometric distortion could be worse because the monitor is no longer set to its factory specifications.

## System 7: Using Retrospect 1.3 with File Sharing Active (8/93)

Revised: 9/3/93  
Security: Everyone

System 7: Using Retrospect 1.3 with File Sharing Active (8/93)

=====

Article Created: 2 August 1991  
Article Reviewed/Updated: 27 August 1993

TOPIC -----

My System hangs after requesting either Restore or Retrieve in Retrospect 1.3 with file sharing turned on.

DISCUSSION -----

The System hang is caused by a corrupted desktop file following a backup with Retrospect 1.3. Here's how to solve this problem:

- 1) Rebuild the Macintosh's desktop file by holding the Command and Option keys down while restarting the system.
- 2) Install either  
    System 7 Tune-Up (if using System 7.0 or System 7.0.1)  
    System 7.1

## System 7: Memory Errors in PrintMonitor

Revised: 9/18/92  
Security: Everyone

System 7: Memory Errors in PrintMonitor

Article Created: 2 August 1991

### Article Change History

09/17/92 - UPDATED  
• With information about System 7 Tune-Up.  
05/11/92 - REVIEWED  
• For accuracy.

### TOPIC -----

When trying to print in the background, PrintMonitor delivered the following message: "Not enough memory to print. PrintMonitor will try to print again when more memory is available." The document was saved in the PrintMonitor queue and never printed.

I've encountered this problem on Macintosh II and Macintosh SE computers with 2MB to 8MB of RAM installed. I turned off virtual memory. I printed from various applications, including the Finder.

### DISCUSSION -----

In low-memory situations this is a valid error message; for instance, if PrintMonitor needs more memory allocated to it, or if there is not enough available RAM to launch PrintMonitor. But if the suggested memory size for PrintMonitor is adequate, and there is plenty of RAM for PrintMonitor to expand, this error message indicates there is a problem with the PrintMonitor application.

When trying to print in the background under System 7, a "Not enough memory" error might indicate a damaged PrintMonitor application. When this occurs, install a new copy of PrintMonitor from the Install 1 disk. Either install this file using the Installer program, or simply drag it over. The waiting print jobs will print as soon as you install the new PrintMonitor.

You may also want to run Disk First Aid, but this isn't always necessary. To avoid this kind of damage to PrintMonitor in the future, upgrade your system software with the System 7 Tune-Up. Revised LaserWriter drivers in the Tune-Up prevent PrintMonitor from getting damaged as it occasionally did before. The current version of System 7 Tune-Up is 1.1.1.

## System 7: Intercharacter Spacing, Kerning in 6.x and 7.0

Revised: 8/9/91  
Security: Everyone

System 7: Intercharacter Spacing, Kerning in 6.x and 7.0

=====

Article Created: 2 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Is there any difference between intercharacter spacing and kerning pairs in system software 7.0 and 6.x? What is the difference between bitmap and TrueType spacing?

DISCUSSION -----

Spacing and Kerning

-----

Apple didn't change spacing with the bitmap characters in System 7, but matched each bitmapped character width in 6.x to the corresponding character in 7.0. New bitmap characters created just for System 7 will have spacing differences.

Apple didn't changed the kerning pairs either. Many applications allow you to change kerning.

Bitmap and TrueType Spacing Differences

-----

Bitmaps use integer widths, while outline fonts (TrueType) use fractional widths. Fractional widths allow exact size adjustments for intercharacter spacing as well as kerning. Integer widths limit these adjustments to whole sizes. This is one of the main advantages of TrueType.

## System 7: Reserved Fonts are Invisible

Revised: 8/9/91  
Security: Everyone

System 7: Reserved Fonts are Invisible

=====

Article Created: 2 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I was moving fonts between my System 6 and System 7 Macintosh computers. I didn't see some of the basic fonts, like Geneva 9 or Chicago 12, on my System 7 Macintosh. When I moved the same suitcases back to System 6, I saw them with no problem using Font/DA Mover. Why?

DISCUSSION -----

In System 7.0, reserved fonts such as Geneva 9 or Chicago 12 are made invisible by the Finder. This prevents novice users from removing these fonts from the System suitcase, which would cause crashes. Reserved fonts are invisible in both System font suitcases and regular font suitcases under System 7.

Reserved fonts include:

- Geneva 9
- Geneva 12
- Chicago 12
- Monaco 9

Although this prevents serious damage to system files, it is confusing to users who moved the fonts using Font/DA Mover under System 6.

Font/DA Mover can view and copy these fonts. Remember that Font/DA Mover version 4.1 is necessary to use suitcases that contain TrueType fonts.

## System 7: Problem with Stationery's Save In Option

Revised: 8/9/91  
Security: Everyone

System 7: Problem with Stationery's "Save In" Option

=====

Article Created: 31 July 1991

### Article Change History

-----

08/19/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

The Finder seems to restart itself or crash occasionally when I try to save a copy of a stationery document. This happens when I double-click the document in the Finder and attempt to save the copy to a floppy disk.

### DISCUSSION -----

There is a known problem with the Save In option of stationery documents created from older "stationery-unaware" applications.

The problem occurs after you double-click on a stationery document, choose Save In, and then insert a floppy disk. When you choose to save the document on the floppy disk, you will either get an error or the system will return to the Finder without saving the document.

The problem does not occur when you mount a floppy disk before you open the stationery document.

## System 7: CloseView's Command Keys

Revised: 9/25/92  
Security: Everyone

System 7: CloseView's Command Keys

Article Created: 31 July 1991

### Article Change History

09/25/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

I was trying to open a folder in System 7, when suddenly a big black box appeared around my pointer. I can make it go away if I turn off extensions at startup (by holding down the shift key), but I don't understand what's going on.

### DISCUSSION -----

You have inadvertently activated CloseView, a utility designed to aid the visually impaired. To turn off CloseView, type Command-Option-O. To learn how to use CloseView, refer to the Macintosh User's Guide.

When using CloseView, notice that its shortcut keystrokes are very similar to shortcut keystrokes built into the new Finder. When trying to open the folder, you may have inadvertently used the keystroke to activate CloseView. In general, the slight differences between the Finder and CloseView commands may cause confusion.

For example:

|            |                  |                           |
|------------|------------------|---------------------------|
| Finder:    | Command-O        | Opens window              |
| CloseView: | Command-Option-O | Turn on/off CloseView     |
| Finder:    | Command-X        | Cut                       |
| CloseView: | Command-Option-X | Turn on/off magnification |

|         |                 |                         |
|---------|-----------------|-------------------------|
| Finder: | Command-UpArrow | Go to next higher level |
|---------|-----------------|-------------------------|

|            |                        |                              |
|------------|------------------------|------------------------------|
| CloseView: | Command-Option-UpArrow | Increase magnification level |
|------------|------------------------|------------------------------|

|         |                   |                                       |
|---------|-------------------|---------------------------------------|
| Finder: | Command-DownArrow | Go to next lower level<br>(open icon) |
|---------|-------------------|---------------------------------------|

|            |                          |                              |
|------------|--------------------------|------------------------------|
| CloseView: | Command-Option-DownArrow | Decrease magnification level |
|------------|--------------------------|------------------------------|

It is unlikely that a novice or casual user would stumble across CloseView, because it is never installed by the System 7 Installer (not even by Easy Install). In fact, if a pre-System 7 version of CloseView was in the System Folder, the System 7 Installer deletes it. To install CloseView, drag it into the Control Panels folder or the System Folder.

CloseView was designed for the visually impaired who may not be able to see their keyboard. A mis-keyed command could cause them a great deal of confusion.

CloseView does not display zoom effects when windows open or close. For many people, the zoom effects are useful for visual orientation, showing what the computer is activating or putting away. Without the zoom effects, items just appear and disappear from the screen.

## System 7: Finder Doesn't Allow Renaming Fonts

Revised: 8/9/91  
Security: Everyone

System 7: Finder Doesn't Allow Renaming Fonts

=====

Article Created: 31 July 1991

### Article Change History

-----

08/25/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

I'm using System 7, and I'm trying to rename some fonts in the Finder, but it won't let me. I can rename any of my sounds, but none of my fonts. What's wrong?

### DISCUSSION -----

You can't change the names of bitmap or TrueType fonts in the System 7 Finder.

There are a few legitimate reasons why end users would want to rename their fonts, but allowing that freedom in the Finder would cause most users considerable confusion. Specifically, if a font name changes, you have to manually update all instances of that font in documents. For instance, if you changed "Palatino" to "MyFont," you would have to open any documents that used "Palatino," select the text, and choose "MyFont" from the font menu. Likewise, transferring files with renamed fonts between Macintosh computers would generate many problems. Therefore, System 7 does not allow changing font names in the Finder.

Utilities such as ResEdit and many font design applications can change the names of fonts.

## Macintosh Plus: Effects of Extreme Cold

Revised: 7/27/92  
Security: Everyone

Macintosh Plus: Effects of Extreme Cold

Article Created: 1 August 1991  
Article Last Reviewed: 27 July 1992  
Article Last Updated:

TOPIC -----

What are the long-term effects of storing a Macintosh Plus in extreme cold (-40 degrees) for an extended period?

DISCUSSION -----

Here are the operational and non-operational (storage) condition specifications for the Macintosh Plus:

Temperature

-----

|           | Degrees<br>Fahrenheit | Degrees<br>Celsius |
|-----------|-----------------------|--------------------|
|           | -----                 | -----              |
| Operating | 50 to 104             | 10 to 40           |
| Storing   | -40 to 122            | -40 to 50          |

Humidity

-----

All conditions: 5% to 90% relative humidity

Altitude

-----

0 to 4615 meters  
0 to 15,000 feet

If you expect the Macintosh Plus to be at -40 (F or C) for a long period, especially if there are occasional dips significantly below -40 degrees, you may encounter some, all, or none of these conditions:

## ..TIL07957-Macintosh\_Plus-Effects\_of\_Extreme\_Cold\_(TA46512).pdf

- Possible thermal stress of the electrolytic capacitors to the extent that they crack, leak, or fail when thawed.
- Possible thermal stress of the fiberglass/epoxy resin of the circuit boards, leading to hairline fractures of the printed circuit board.
- Possible thermal stress of the CRT, leading to hairline fractures of the glass.
- Possible thermal stress of the cables inside the Macintosh Plus, leading to hairline fractures of the insulation or conductor.
- Possible thermal stress of the junctions inside the integrated circuits caused by the variation in thermal expansion of the plastic case and the metal wires.

Any of these scenarios can lead to failure of one or more parts of the system. We recommend that you keep the Macintosh Plus in a closet or in some other heated living quarters. If this is not an option, after removing the system from this extreme temperature, allow the Macintosh Plus to return to a normal operating temperature slowly, possibly over a period of days. By allowing the components to warm gradually, if there hasn't been any irreversible damage, the system should be fine.

If the capacitors have cracked, you may notice some fluid dripping down the left side of the case or some discoloration in this area. In that case, or if the system behaves erratically or you hear crackling or popping on startup, shut down the system immediately and take it to your authorized service center for examination.

AppleShare PC: "Needs Version 3.1 or Later of DOS" Message

=====

Article Created: 2 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

When loading AppleShare PC to an IBM PC, a customer is getting this error message: "needs version 3.1 or later of DOS". The customer tried DOS versions 4.0 and 5.0 and got the same message.

DISCUSSION -----

The problem is associated with the REDIR subdirectory file located in the AppleShare PC DIR. In all probability, your customer is using an AppleShare PC version older than 2.X, which works effectively only with DOS versions through the 3.X series. Your customer needs to upgrade to the more current Farallon version of the AppleShare PC software.

This error message also has been reported by customers when they haven't properly followed the directions for loading files for DOS 5.0. The customer should pay close attention to the instructions regarding "expanding" (see the DOS 5.0 User's Manual, page 28).

## Personal LaserWriter: How To Determine Page Count

Revised: 8/10/91  
Security: Everyone

Personal LaserWriter: How To Determine Page Count

=====

Article Created: 05 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Can you determine the page count on the Personal LaserWriter LS?

DISCUSSION -----

There is no way to determine the actual number of pages that have been printed on a Personal LaserWriter LS and Personal LaserWriter SC controller board or print engine. The Personal LaserWriter NT controller board stores the number of pages that the controller board has printed, but not the number of pages the engine has printed.

With the Personal LaserWriter NT, the customer can keep track of the page count using the controller board (user test print). If the controller board is never changed, the page count should be accurate. If the board is repaired or replaced, the page count will change, and it is the customer's responsibility to monitor the printer's page count. Since the Personal LaserWriter LS and Personal LaserWriter SC do not have the controller count capability, the customer needs to keep track of the page count. To assist customers with this task, Apple offers the Repair Log Label (part number 826-0481).

## Macintosh Portable: Caps Lock Function and System Sleep

Revised: 7/29/92  
Security: Everyone

Macintosh Portable: Caps Lock Function and System Sleep

=====

Article Created: 5 August 1991  
Article Last Reviewed: 29 July 1992  
Article Last Updated: 29 July 1992

TOPIC -----

The Macintosh Portable loses the Caps Lock key function when reactivated from the "sleep" mode.

DISCUSSION -----

In the following situation, the Caps Lock key function is lost:

- 1) The Caps Lock key is pressed and locked in the down position.
- 2) The Macintosh Portable is put into the "sleep" mode.
- 3) The Macintosh Portable is reactivated by pressing a key.

Even though the Caps Lock key is still locked in the down position, the system reverts to lowercase. This happens because the "Caps Lock flag" stored in the register is temporary and is lost during the sleep mode.

To reinstate Caps Lock after reactivating the Macintosh Portable from the "sleep" mode, press the Caps Lock key twice: once to unlock it and a second time to reset it.

This applies to both the original Macintosh Portable and the revised Macintosh Portable with the backlit screen. No "fix" is expected. This problem does not exist with the PowerBooks.

Security: Everyone

System 7: Importing and Saving Documents with Excel 3.0

=====

Article Created: 8 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Excel 3.0 does not seem to be saving changes under System 7.

DISCUSSION -----

Under System 7, if you open an Excel 2.2 document or text file with Excel 3.0, then Save, the Save dialog box opens automatically to the folder where the Excel application resides. According to Microsoft, this is a feature because the file is "new" (converted). The original document, in a different folder, is not overwritten.

If you later open the original document, you might think your changes were never saved.

Here are two workarounds:

- Before saving, navigate back to the original folder and replace the old file.
- Keep Excel 3.0 and your Excel documents in the same folder.

System 7: Installer on Printing Tools Disk is for System 6

=====

Article Created: 5 August 1991

### Article Change History

-----

09/14/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

I removed my printer drivers from the Extensions folder and deleted them. When I reinstalled the system software, the Printing disk displayed this message: "The selected disk 'Hard Disk' does not require a printer update." However, when I chose Customize and "Software for LaserWriter" it installed the proper driver. Is the Installer confused?

### DISCUSSION -----

If the PrintMonitor is in the Extensions folder, the Installer on the Printing disk will indicate that you don't need to update. The Installer on the Install 1 disk will allow you to install a specific driver using Customize. Remove the PrintMonitor to do an Easy Install.

There's a good reason for this. The Installer on the Printing Tools disk is for System 6. The preferred method is to use Customize from the Installer on the Install 1 disk.

System 7: Problem Printing AP Newswire Maps

Article Created: 5 August 1991

### Article Change History

-----  
09/21/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

I installed system software 7.0 on one Macintosh in a network. I then updated the printer drivers of the other Macintosh computers, which are running system software 6.0.3, to the system 7.0 printer drivers. All the computers are getting PostScript Errors "Error: Limit Check, offending command: Closed Path" when printing from MacDraw II version 1.1. The documents are maps in MacDraw II that come from the AP Newswire via Satellite.

### DISCUSSION -----

Once you have eliminated all system-related software conflicts, we suspect System 7 drivers and Postscript are creating this conflict.

According to Claris Tech support, this is a known issue with AP Newswire maps. The objects in these documents have too many vertices. They must be simplified by removing vertex points using MacDraw II. The System 7 LaserWriter drivers are less tolerant of this problem than the System 6 drivers.

### Workarounds:

- Do not print these documents running System 7 or the System 7 printer drivers, or
- Simplify them with MacDraw II.

## System 7: When the Finder Loses Its Colors

Revised: 9/11/92  
Security: Everyone

System 7: When the Finder Loses Its Colors

Article Created: 5 August 1991

### Article Change History

09/11/92 - UPDATED

- To provide additional information.

### TOPIC

My colors sometimes disappear in the Finder. Especially my desktop patterns, labels, and window frame colors. Also, my general control panel colors sometimes switch to black and white. Why is this?

### DISCUSSION

When an application, INIT or control panel "takes away" colors from the Finder, the Finder tries to replace the colors. Unfortunately, the Finder is not "intelligent" about this. A "used" color is no longer available to the Finder. This is very noticeable in 4-bit mode, 16 colors. When the Finder doesn't have enough choices, it often defaults to black and white until the colors are "given back." Restarting the computer is one of the actions that restores the colors. It may also be necessary to restore the label colors to their original values. Search on label colors for more information.

## System 7: How Apple PostScript Printers Handle TrueType (11/93)

Revised: 11/9/93  
Security: Everyone

System 7: How Apple PostScript Printers Handle TrueType (11/93)

Article Created: 5 August 1991  
Article Reviewed/Updated: 9 November 1993

TOPIC -----

With what Apple PostScript printers will TrueType work?

DISCUSSION -----

First, a little history on TrueType and PostScript:

The TrueType format places all PostScript devices into one of three class categories depending on the device and its TrueType capabilities. The three classes are:

- 1) Class A devices are those with a TrueType scaler embedded in the PostScript device (the ROM.) For example, the LaserWriter IIx/IIg, LaserWriter Pro 600/630, and the LaserWriter Select 360 all fall into this category.
- 2) Class B devices are those that depend on the TrueType scaler to be downloaded to the device separately from the font itself. Most third-party 680x0 PostScript printers and the LaserWriter Pro 810 fall into this category.
- 3) Class C devices do not have TrueType available in any form.

Here's how TrueType works with Apple LaserWriter Printers:

LaserWriter  
-----

The original LaserWriter, containing a 68000 microprocessor, can't print TrueType. The TrueType rasterizer CANNOT be downloaded to the original LaserWriter which has ROM version 1.0 (PostScript version 23.0). Thus, it CANNOT print TrueType fonts. The TrueType rasterizer can only be

downloaded to LaserWriters with PostScript version 38.0 or ABOVE.  
PostScript version 38.0 or 47.0 ROMs are LaserWriter Plus ROMs which can be installed on an original LaserWriter, making it a LaserWriter Plus.

In terms of which LaserWriter driver to use, version 6.1 or greater is required to print TrueType.

#### LaserWriter Plus

-----

The LaserWriter Plus, also 68000-based, does not download the scaler code, but TrueType will work. It converts TrueType code to encrypted Type 3 instructions (better known as unhinted Type 1) before delivering it to the printer. Performance is slow due to memory management constraints in that version of ROM. Memory constraints affect performance when converting and downloading large numbers of TrueType fonts.

#### LaserWriter IINT

-----

The LaserWriter IINT, also 68000-based, downloads the scaler code and TrueType does work. The performance and handling of multiple fonts is faster than the previous printers but slower than the LaserWriter IINTX.

#### LaserWriter IINTX and IINTX-J (Kanji version)

-----

The LaserWriter IINTX and IINTX-J, which contain a 68020 microprocessor, download the scaler code and TrueType does work. Performance and handling with multiple fonts is faster than with the earlier printers. How much faster depends on the RAM available size.

#### Personal LaserWriter NTR

-----

The TrueType Scaler is in ROM for optimum TrueType font performance.

#### LaserWriter IIx & IIg

-----

The TrueType Scaler is in ROM for optimum TrueType font performance.

#### LaserWriter Select 310

-----

The LaserWriter Select 310 downloads the scaler code and TrueType does work.

#### LaserWriter Pro 600 & 630

-----

The TrueType Scaler is in ROM for optimum TrueType font performance.

#### LaserWriter Select 360

-----

The TrueType Scaler is in ROM for optimum TrueType font performance.

#### LaserWriter Pro 810

-----

The LaserWriter Pro 810 supports TrueType using the downloaded scaler.

## System 7: When LaserWriter Driver Doesn't Appear in Chooser

Revised: 9/11/92  
Security: Everyone

System 7: When LaserWriter Driver Doesn't Appear in Chooser

=====

Article Created: 5 August 1991

### Article Change History

-----

09/11/92 - REVISED  
• With more information.

### TOPIC -----

I can't select the LaserWriter icon in the Chooser. What's the problem?

### DISCUSSION -----

You probably have a damaged driver. Only the LaserWriter (PostScript) driver is affected. To fix this, reinstall the driver. Make sure you reinstall the correct version, from your original disks.

## System 7: TrueType and the Original LaserWriter

Revised: 5/14/93  
Security: Everyone

System 7: TrueType and the Original LaserWriter

=====

Article Created: 5 August 1991

### Article Change History

-----

05/13/93 - REVISED  
• For technical accuracy

### TOPIC -----

When I try to print to an original LaserWriter using the TrueType fonts under System 7.0, I get a PostScript error, but Adobe Fonts print fine.

### DISCUSSION -----

The bottom line is that the TrueType rasterizer CANNOT be downloaded to the original LaserWriter which has ROM version 1.0 (PostScript version 23.0). Thus, it CANNOT print TrueType fonts. The TrueType rasterizer can only be downloaded to LaserWriters with PostScript version 38.0 or ABOVE. PostScript version 38.0 or 47.0 ROMs are LaserWriter Plus ROMs which can be installed on an original LaserWriter, making it a LaserWriter Plus.

In terms of which LaserWriter driver to use, version 6.1 or greater is required to print TrueType.

## System 7: Fix for Lost Microsoft Word Custom Icons (12/94)

Revised: 12/5/94  
Security: Everyone

System 7: Fix for Lost Microsoft Word Custom Icons (12/94)

Article Created: 6 August 1991  
Article Reviewed/Updated: 05 December 1994

TOPIC -----

Under System 7, whenever I save a Microsoft Word file with a custom icon, the icon becomes the generic document icon. Also, the comments in the Get Info box disappear. How can I fix this?

DISCUSSION -----

Microsoft Word is one of the few programs that completely rewrites an existing document when it saves, rather than updating the original. This deletes the custom icon and the Get Info comments from the file. But the file is still marked to use a custom icon, and the Finder deals with this by assigning it the generic document icon.

To fix the icon, use ResEdit or another resource utility to reset the "Use custom icon" bit to off. Pasting in a custom icon will not fix the problem; you will get the error message "The command could not be completed because an error of type -39 occurred."

Here is a workaround for Word files saved in normal format (this doesn't work for Word text files):

- 1) In Microsoft Word, choose Commands from the Edit menu.
- 2) Choose Fast Save Enabled, and click Add.
- 3) Save the change, replacing the current Word Settings.
- 4) Cancel out of the Commands window.
- 5) Under MS Word's Edit Menu, make sure Fast Save Enabled has a check next to it.

- 6) You should now be able to change the document without losing the custom icon.

CAUTION: The use of ResEdit is not recommended for anyone unfamiliar with its use. Irreparable damage to your software is possible, always work from a backup. If you are unfamiliar with its use, DO NOT USE IT.

## System 7: When Finder Icons Seem to be Stacked On One Another

Revised: 9/10/92  
Security: Everyone

System 7: When Finder Icons Seem to be Stacked On One Another

=====

Article Created: 6 August 1991

### Article Change History

-----

09/10/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

I use file sharing to make a folder available to a co-worker. When I open the folder and view by icon, I see only one document because all the icons in the folder are stacked on top of each other.

### DISCUSSION -----

This is not a bug, and there is no difference in the way Finder handles icons for file sharing. With the "Always snap to grid" feature turned on in the Views control panel, it is possible for icons to share the same place on the grid. This feature allows more items to fit in a window. If you prefer not to stack icons, you can turn off the "snap to grid" feature.

Here's how to "unstack" the icons:

- 1) Choose "by Icon" or "by Small Icon" from the View menu.
- 2) Hold down the Option key while choosing Clean Up by Name from the Special menu.

We were able to duplicate icon stacking when we dropped the documents one-by-one into an open folder at approximately the same location with snap to grid turned on. The result was the same with either straight or staggered grid. Icon stacking does not happen when moving documents to closed folders.

## System 7: Switching Among Keyboard Maps (2/95)

Revised: 2/15/95  
Security: Everyone

System 7: Switching Among Keyboard Maps (2/95)

Article Created: 6 August 1991  
Article Reviewed/Updated: 15 February 1995

TOPIC -----

I installed multiple keyboard maps into the System file to allow switching between languages like English and Spanish.

Here are two ways I switch maps:

- Open the Keyboard control panel and select it from a list, or
- Press a Command-Option-Spacebar sequence to "rotate" between the maps.

The problem is some applications use the Command-Option-Spacebar sequence for other operations. If I use this sequence to perform the application's command, the command is performed as expected, but the operating system also "rotates" the keyboard maps. Is there a workaround?

DISCUSSION -----

This key sequence is a reserved part of the operating system which should not be used by an application. Applications may also use this key sequence for other operations but there will be conflicts if multiple keyboard maps are present.

Here are three workarounds:

- Don't install more than one keyboard map into the System if you can avoid it. System 7.5 installs all keyboard maps as a default. You can remove those you will not be using by opening up the System suitcase and dragging them to the trash.
- After using the key sequence, open the Keyboard CDEV and change the map with the mouse.
- Use the mouse to perform the application's command, rather than the key sequence.

A checkbox will be added to the Keyboard Control Panel to disable this feature in System Update 1.0 for System 7.5.

## Why Macintosh Portable & PowerBook Computers Won't Sleep (9/96)

Revised: 9/5/96  
Security: Everyone

Why Macintosh Portable & PowerBook Computers Won't Sleep (9/96)

Article Created: 8 August 1991  
Article Reviewed/Updated: 5 September 1996

TOPIC -----

Sometimes Macintosh Portable and PowerBook computers running any version of System 7.x will not go into Sleep mode, regardless of the sleep time settings in the Portable or PowerBook control panel. Why is this?

DISCUSSION -----

The following activities may prevent the Macintosh Portable or PowerBook computer from sleeping UNLESS a low-power condition occurs:

Common Causes

=====

- The "Stay awake when plugged in" option is selected in the Portable control panel, AND you are plugged into AC power.
- The PowerBook control panel slider selections are set to "Never sleep."
- The serial driver is open and active.
- AppleTalk is active (Check the Chooser). Note: A volume does not need to be mounted nor do you need to be connected to an AppleTalk network.
- When an internal modem's auto-answer is on.

Further Troubleshooting Tips

=====

- PowerBook 5300 and 190: There is a known issue with the password security feature on the PowerBook 5300 and 190 series computers. If you open the Password Security control panel and set the password security is turned on and is set for

ask password on wake, the unit will not sleep. One workaround is to turn off the "ask for password on wake" feature. If this is done, the PowerBook will be able to sleep. This issue can be resolved by installing the System 7.5 Update 2.0 (or later system software) which includes the Password Security 1.0.3 control panel.

- Check to make sure that there are no INITs (extensions) or control panels in the System Folder that may be causing the computer to assume that the system is busy. (For example, the FocalPoint II INIT has been shown to cause this; others may also.)

- Make sure there are no applications currently running which would keep the system busy. (For example, Microsoft Word's automatic repagination option will keep the system awake.)

- An extension called Insomnia came on the Install Me First disk with some versions of the system software. If this extension is mistakenly put into the Extensions folder in the active System folder on the hard drive, the PowerBook will not sleep. It should be removed from the hard drive. Insomnia is an extension that keeps the PowerBook from going to sleep during the installation process when starting from the Install Me First disk.

#### Technical Details

=====

For the more technically inclined, the following system activities also prevent the machine from entering the sleep or rest mode:

- A call to Read or Write through IOCore.
- Calling PostEvent.
- OSEventAvail returning true.
- Generating a sound.
- Execution of an ADB completion routine.
- A call to SetCursor (that really changes the cursor).
- The watch cursor is the active cursor.

## System 7: Disk Space for Minimal and System-Specific Installs

Revised: 9/18/92  
Security: Everyone

System 7: Disk Space for Minimal and System-Specific Installs

Article Created: 7 August 1991

### Article Change History

09/14/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

What is the difference in disk space required for a Minimal Install ("Minimal Install for...") and a System Specific Install ("System Software for...")?

### DISCUSSION -----

We installed system software 7.0 on several Macintosh computers to answer this question. For the minimal installs, we chose Customize and then "Minimal Install for..." For the system specific installs, we chose Customize and then installed software configurations for the specific Macintosh.

System software requires about 1593K, averaging Minimal Installs and Full Installs together.

A minimal install placed the following items in the System Folder of a Macintosh SE/30:

| Name                     | Type     | Size |
|--------------------------|----------|------|
| -----                    |          |      |
| Apple Menu Items         | (folder) | --   |
| - Control Panels [alias] | (file)   | 2K   |
| Control Panels           | (folder) | --   |
| Finder                   | (file)   | 356K |
| System                   | (file)   | 756K |

There are no Extension or Preference folders. The system builds them at startup. The only font that you can see is the Geneva (Italic) 9 used for alias filenames.

Here is a table of differences in disk space needed for Minimal Installs and System Specific Installs (SSI):

| Computer           | SSI  | Minimal | Difference |
|--------------------|------|---------|------------|
| Macintosh Plus     | 2496 | 975     | 1521       |
| Macintosh SE       | 2499 | 974     | 1525       |
| Macintosh Classic  | 2508 | 974     | 1534       |
| Macintosh SE/30    | 2737 | 1116    | 1621       |
| Macintosh LC       | 2670 | 1049    | 1621       |
| Macintosh Portable | 2541 | 971     | 1570       |
| Macintosh II       | 2737 | 1116    | 1621       |
| Macintosh IIX      | 2737 | 1116    | 1621       |
| Macintosh IISi     | 2669 | 1049    | 1621       |
| Macintosh IICx     | 2737 | 1116    | 1621       |
| Macintosh IICI     | 2666 | 1045    | 1621       |
| Macintosh IIIfx    | 2671 | 1050    | 1621       |

## System 7: Why the Clean Up Command Leaves Gaps Between Icons

Revised: 9/11/92  
Security: Everyone

System 7: Why the Clean Up Command Leaves Gaps Between Icons

=====

Article Created: 6 August 1991

### Article Change History

-----

09/11/92 - REVISED

- To add more information.

### TOPIC -----

Why is it that when I use the Finder's "Clean Up by Name" command, with the Option key held down, the result is often large gaps between the icons in the window?

### DISCUSSION -----

This is a feature of System 7's Finder. It prevents the overlapping of long filenames so you can read each icon's complete name, regardless of its length.

System 7 allows a long filename on an icon to run into the next spot on the grid rather than placing another icon there. The Finder skips one spot on the grid and places the next icon in the next available spot. This creates extra space between icons. The Finder does this regardless of the "Always snap to grid" choice in the Views control panel. If you don't like the extra space, you can manually place the icons where you want them. Alternatively, try shortening the name of the file or folder that is causing the gap.

## System 7: MacPlot Driver Configuration

Revised: 9/22/92  
Security: Everyone

System 7: MacPlot Driver Configuration

Article Created: 7 August 1991

### Article Change History

-----  
09/21/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

I can't print to my Hewlett Packard plotter from MacDraw Pro. Why not?

### DISCUSSION -----

The MacPlot driver for the Hewlett Packard plotter must be configured in a particular way under System 7. According to Microspot's technical support, this is the setup:

- 1) Put the driver in the Extensions folder.
- 2) Select the plotter in the Chooser.
- 3) Pull the driver out of the Extensions folder to the top level of the System Folder.
- 4) Configure the plotter through the Configure Application.
- 4) Put the driver back into the Extensions folder.
- 5) Make an alias of the driver and place it at the top level of the System Folder.

The driver is bundled with MacDraw Pro and is also sold separately by Microspot. If the driver was bundled with a Claris product, please call Claris for technical support instead of Microspot. To locate a vendor's

address and phone number, use the vendor name as a search string.

## System 7: Purpose of Cerulean Data File

Revised: 9/18/92  
Security: Everyone

System 7: Purpose of Cerulean Data File

=====

Article Created: 5 August 1991

### Article Change History

-----

09/14/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

I don't know if I installed system software 7.0 correctly. What is this Cerulean Data file on the Install 2 disk, and why didn't the Installer put it on my hard disk?

### DISCUSSION -----

The System file is so large that it can't fit on a single 800K floppy disk. To distribute it on 800K floppy disks, many of the resources that are part of the System file are in the Cerulean Data file. The Installer combines the System and Cerulean Data files into a single System file on your hard disk. The Installer displays the message, "Building file: System" when it is joining the files on the hard disk.

The resources stored in the Cerulean Data file include icons, desktop patterns, instructions for displaying menus, dialog boxes and alert messages, and other code to make the system work. Because the Installer adds all of these items to the System file, you don't need a copy of the Cerulean Data file on your hard disk.

## System 7: Compatibility Checker Stack and Newer Applications

Revised: 9/3/92  
Security: Everyone

System 7: Compatibility Checker Stack and Newer Applications

=====

Article Created: 5 August 1991

### Article Change History

-----

09/02/92 - UPDATED

- With information about version 1.1 and with information from related articles.

### TOPIC -----

I just got the latest version of an application that the developer assures me is System 7-compatible. But when I ran the Compatibility Checker, it flagged the application as incompatible and told me I needed an update. What's going on?

### DISCUSSION -----

The Compatibility Checker version 1.0 was compiled from information sent to Apple by developers before System 7's release. Since then, many developers have released newer versions of their software. Because the Compatibility Checker looks at specific version numbers of applications, it can't recognize the newer versions, and flags them as incompatible.

If you have questions, contact the application developer for a definitive answer, including compatibility regarding file sharing, 32-bit addressing, and virtual memory.

Note: even when application developers state explicitly that their products are System 7-compatible, there is no guarantee that those applications are problem-free; issues still may occur when other variables are brought in such as third party INITs and cdevs, also known as system extensions and control panel devices.

Compatibility Checker 1.1, which updates the original, has 165 new records, as well as updated product compatibility information and corrected phone numbers. It also offers compatibility information on third-party drivers. But with new versions of applications coming out constantly, the same problem may be encountered as with the original version.

## System 7: Role of Font/DA Mover 4.1 (9/94)

Revised: 9/16/94  
Security: Everyone

System 7: Role of Font/DA Mover 4.1 (9/94)

Article Created: 5 August 1991  
Article Reviewed/Updated: 15 September 1994

TOPIC -----

In the System 7 Group Upgrade Kit, there's a copy of Font/DA Mover 4.1, but no instructions for using it. The only reference to it is on page 64 of the "Group Upgrade Guide," which says that it isn't compatible with System 7. Why did Apple include it on the CD?

DISCUSSION -----

Using with System 7  
-----

Font/DA Mover 4.1 IS COMPATIBLE with System 7, although it's unnecessary to use if you want to manipulate fonts in the System file and other suitcases directly in the Finder. However, the Font/DA Mover 4.1 is necessary to use with System 7 if you want to manipulate/add/delete fonts WITHIN a specific application such as MusicProse or Finale! by Coda Music.

It is also possible to use Font/DA Mover with System 7 to recover fonts from a damaged System file, but Apple does not recommend or support this use of the Font/DA Mover.

Using with System 6  
-----

Font/DA Mover 4.1, along with the TrueType extension, is included on the System 7 CD-ROM so customers can use TrueType fonts on Macintosh computers running System 6. Font/DA Mover 4.1 allows System 6 users to manipulate TrueType fonts (view, copy, and remove) in their System file and other suitcases, in addition to bitmap fonts and desk accessories. It is otherwise identical to earlier versions of Font/DA Mover.

The TrueType extension (INIT) allows System 6 users to create, display and print documents that use TrueType fonts. It's fully compatible with

system software 6.0.7 and 6.0.8. It may also work with version 6.0.5, but Apple hasn't fully tested it, and doesn't support this use of it.

You can also obtain Font/DA Mover 4.1 from AppleLink.

## System 7: Restoring from HD Backup

Revised: 9/3/92  
Security: Everyone

System 7: Restoring from HD Backup

=====

Article Created: 5 August 1991

### Article Change History

-----

09/02/92 - REVISED

- To add additional information.

### TOPIC -----

How do I restore a backup of my hard disk that I made with HD Backup if I've installed System 7? I heard that HD Backup is incompatible with System 7.

### DISCUSSION -----

HD Backup is incompatible with System 7, but there are a number of workarounds if you need to restore an HD Backup set of data onto a volume.

- You can start up from a volume that has System 6 on it, such as a second hard disk or floppy disk. This works even if you have only a single floppy drive and no extra hard disk (although you'll be swapping floppy disks a lot). To start from the other drive, insert a System 6 floppy disk before startup, or choose the other hard disk using the Startup Disk control panel.
- Another workaround is to pull individual files from floppy disks in the backup set onto the hard disk. This works best if there are a few files that need to be restored, but not the entire backup set. You may have a problem if HD Backup split large files across multiple floppy disks.
- The most drastic workaround is to reinstall System 6 on the hard disk and then run HD Backup. Note that this may be a problematic

procedure in itself, and the details of that procedure aren't covered in this article. Specifically, most new Macintosh models require System 7 to operate and would not be able to move back down to System 6.

## System 7: Precautions When Installing Over System 6

Revised: 9/22/92  
Security: Everyone

System 7: Precautions When Installing Over System 6

=====

Article Created: 6 August 1991

### Article Change History

-----

09/14/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

Be careful when installing System 7 over any version of System 6, especially versions earlier than 6.0.5. This article tells you the steps to take and the precautions to observe when installing System 7 over System 6.

### DISCUSSION -----

- 1) Be sure to search the entire hard disk for multiple system folders, and remove all but the main System Folder.

Use the Find File DA in System 6 to find multiple system folders. Note that you may have to do this a number of times. If there are multiple system folders, THROW AWAY any extras and empty the Trash.

IMPORTANT NOTE: Altering a System Folder by renaming it and removing the Finder does not work with versions earlier than 6.0.5; the Macintosh may crash or hang on startup.

- 2) Run the Compatibility Checker.
- 3) There are two ways to proceed in this step:

- Install System 7 over System 6.

To do this, simply start up from the Install 1 disk and run the

Installer program.

- Alternatively, trash the remaining System and Finder files, rename the System Folder, and install System 7.

Use this procedure if you've had problems installing over System 6. The Installer won't move any of the System 6 files into the new System Folder. You can manually move some files from the old System Folder, such as INITs, cdevs, fonts, and application Preference files or folders. Unknown or untested software may conflict.

## System 7: Using the Before You Install Stack

Revised: 9/21/92  
Security: Everyone

System 7: Using the "Before You Install" Stack

=====

Article Created: 6 August 1991

### Article Change History

-----

09/14/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

The menus don't seem to work in the Before You Install HyperCard stack. I get messages telling me to click on an arrow when I make a selection.

### DISCUSSION -----

The stack named "Before You Install" demonstrates the features of System 7 in a HyperCard window that greatly resembles the real system, but is only a demonstration program. Items that you would normally select with the mouse such as menus, icons, or windows, are just pictures, and are not actually interactive. If you try to use the mouse to select any items on screen, you get the following message: "This example desktop is for System 7 demonstration only. To move ahead in any topic, click the forward arrow, below."

The program displays the current topic at the lower left of the HyperCard window. On the lower right are buttons to help navigate through the stack (left and right arrows, Contents and/or Topics). If you can't see these items at the bottom of the window, it may be that the window is too low on your screen. You can't reposition this HyperCard window when it doesn't have a title bar.

To reposition the window, quit HyperCard (type Command-Q), and again launch the Before You Install stack. The title bar, "Before You Install System 7," should now appear at the top of the window. Use the mouse to reposition the window properly so that you can see "Contents" (the topic

name) and the Quit button at the bottom of the window.

One other problem you may find is that Before You Install has no close box or button, only a Quit button. Since it is possible to have more than one HyperCard stack open with HyperCard versions later than 2.0, quitting will close all open HyperCard stacks.

The sample applications mentioned in Before You Install, such as MemoWriter and Let's Draw, are fictional and are not included with System 7 or HyperCard.

## A/UX: No Yellow Pages for Non-Privileged Accounts

Revised: 8/16/93  
Security: Everyone

A/UX: No Yellow Pages for Non-Privileged Accounts

=====  
Article Created: 8 August 1991  
Article Reviewed/Updated: 31 June 1992

TOPIC -----

The Yellow Pages appears to be broken, at least on a non-privileged account. When I try to log in, login fails with several error messages written to the screen. These are quickly erased before returning to the login screen.

DISCUSSION -----

The problem is that non-privileged accounts cannot log in. Root can still log in. This isn't a Yellow Pages problem; it's a disk space problem.

The default file system for A/UX is a Berkeley file system. The Berkeley file system reserves a percentage of the disk for use exclusively by root. The default "high water mark" is 10 percent, although you can adjust this with the tuneefs command.

If the unused space on the file system is less than the high water mark, non-privileged users cannot log in. This is to prevent situations where you cannot do anything because the disk is too full. Root can still login and remove files to enable other logins.

Printing: Background Printing Is Normally Slower

=====

Article Created: 8 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Documents printed with non-TrueType screen fonts under background printing take several minutes per page on the Personal LaserWriter LS. Why?

DISCUSSION -----

This is normal. The advantage of background printing is that it lets you work on a task while a document is printing. Printing in the background means that printing must share the processor with some other process instead of taking all the processing speed. Therefore, it is slower. What you see is normal.

## DAL: When RDB Locks Entire Database

Revised: 6/29/92  
Security: Everyone

DAL: When RDB Locks Entire Database

=====

Article Created: 8 August 1991  
Article Last Reviewed: 29 June 1992  
Article Last Updated: 4 November 1991

### TOPIC -----

When I use DAL to insert data into RDB, the whole system locks until the user doing the insert does a commit. It should only lock the current record, not the entire database.

### DISCUSSION -----

When using DAL with RDB, each user should have a distinct VMS account, including unique UICs and login directories. With a DBMS like Oracle, which has its own user account validation system with the DBMS, you don't need distinct VMS accounts.

However, RDB relies on VMS to let it know who is using which record. If RDB can't distinguish between the different accounts, it can't tell which record is being updated, so it locks all records opened by the current user. Because, in this case, everyone is effectively the same user, all records are locked for everyone until the commit is complete.

This issue was addressed in RDB 4.0 and DAL 1.3.

DAL and MVS/TSO Server: Troubleshooting Tips

=====

Article Created: 12 August 1991  
Article Last Reviewed: 30 June, 1992  
Article Last Updated: 30 June 1992

TOPIC -----

If the login sequence seems to work, but attempts to open tables and retrieve data fails, try these troubleshooting steps.

DISCUSSION -----

From the Begin prompt with the DAL Tester or DAL Debugger, enter the command:

```
describe DBMS;  
printall;  
go
```

If DB2 isn't listed as a choice, then something is wrong with the DAL installation on the host. If DB2 is listed as an available DBMS, then try to open it with:

```
open DB2 DBMS;  
go
```

If the DBMS opens successfully, then try:

```
describe databases;  
printall;  
go
```

A list of available subsystem IDs should appear. If nothing comes back, then the environment file is empty or inaccessible.

Next, open the desired database and see what's in it with:

```
open db2 database '_____' ;  
describe tables ;  
printall ;  
go
```

If the only tables listed are not correct, or if a -551 error is returned, see Appendix B of the "Data Access Language Server Installation and Operating Guide for MVS/TSO." Appendix B describes how to set up views for DAL users to access the DB2 tables.

## DAL 1.2: DB-2 Query with Sum Statement Crashes Server

Revised: 6/29/92  
Security: Everyone

DAL 1.2: DB-2 Query with Sum Statement Crashes Server

=====

Article Created: 12 August 1991  
Article Last Reviewed: 29 June 1992  
Article Last Updated: 29 June 1992

TOPIC -----

This DB2 query crashes the DAL server on the mainframe:

```
select column1, sum(column2) from table group by column1;
```

Without the sum statement, the query works without any problems. The same query works fine in native DB2 SQL.

DISCUSSION -----

This is a known bug in DAL 1.2. It's fixed in DAL 1.3.

A sum fails in DAL 1.2 if the column to be summed is of type 9 (VARCHAR) with nulls allowed. It doesn't matter if there actually are nulls in the table or not.

## System 7: Troubleshooting Compatibility Checker Problems

Revised: 9/21/92  
Security: Everyone

System 7: Troubleshooting Compatibility Checker Problems

Article Created: 2 August 1991

### Article Change History

-----  
09/14/92 - REVISED  
• For accuracy.

### TOPIC -----

This article tells what to do if the Compatibility Checker will not launch, or if it fails before completing the check. Also included is a table with the correct versions of HyperCard to use with various system software versions.

### DISCUSSION -----

#### Procedures for System Software 6.0.5 or Later

- 
- System 6.0.5 requires HyperCard 1.2.5 or higher; make sure you have the right version.
  - Start from the System 7 Disk Tools disk and run Disk First Aid, then try Compatibility Checker again.
  - Copy the HyperCard application and Home stack from the System 7 HyperCard disk and the Compatibility Checker stack from the "Before You Install" disk to your hard drive. Now try running the Compatibility Checker from the hard drive.
  - If the Compatibility Checker still won't launch, there may be a problem with the current System 6 software. Start up with the System 6 System Tools disk or the version 6.0.7 System Startup disk and install the operating system with Installer.

- Back up your hard disk, start from the Install 1 disk and install System 7 first. After the installation is complete, restart the computer with the shift key down to temporarily disable all system extensions.

#### Procedures for System Software 6.0.4 or Earlier

-----

- Make sure you are using the correct version of HyperCard. See the Operating System/HyperCard Requirements section of this article to find the HyperCard version you need.
- You must upgrade to System 7 before using the Compatibility Checker if:
  - You don't have the correct version of HyperCard on your hard disk and can't locate it on a floppy disk.
  - You are using a version of the system software earlier than 4.1.

There are more instructions for this procedure on page 11 of the "How to Install System 7" manual, included with System 7. After the installation, restart the computer while pressing the shift key to temporarily disable all system extensions.

#### Operating System/HyperCard Requirements

-----

| System Version | Recommended HyperCard Versions |
|----------------|--------------------------------|
| -----          | -----                          |
| 7.0            | 2.1 or later                   |
| 6.0.5 - 6.0.7  | 1.2.5, 2.0 or later            |
| 6.0.4          | 1.2.5                          |
| 4.1 - 6.0.3    | 1.2.2                          |
| Prior to 4.1   | n/a                            |

For information about Compatibility Checker error messages, search under "System 7" and "Compatibility Checker".

## System 7.x: Compatibility Checker Error Messages (11/93)

Revised: 11/17/93  
Security: Everyone

System 7.x: Compatibility Checker Error Messages (11/93)

Article Created: 12 August 1991  
Article Reviewed/Updated: 17 November 1993

TOPIC -----

This article tells you what to do when the Compatibility Checker displays these error messages.

DISCUSSION -----

Since the Compatibility Checker was made into an application with version 2.0, which comes with System Software 7.1, and it's newer version 7.1.1, which comes with System 7 Pro, you no longer receive HyperCard error messages.

If you are using the HyperCard based Compatibility Checker that comes with System 7.0, the following information lists common error messages:

- Error: "New file format requires a new version of HyperCard."

After you convert the Compatibility Checker stack to HyperCard 2.0 format, you CANNOT run it under earlier versions of HyperCard. This converted stack needs system software 6.0.5 or later, and HyperCard 2.0 or later. If you don't have the required software, follow these steps:

- 1) Copy the HyperCard application and Home stack from the System 7 "HyperCard" disk, and the Compatibility Checker from the "Before You Install" disk to your hard disk.
- 2) Start the Macintosh with the System 7 "Disk Tools" disk.
- 3) Double click on the Compatibility Checker. Because the Compatibility Checker can check for compatible INITs and CDEVs only in the System Folder of the startup disk, it won't check the System Folder on your hard disk. But you can still check the applications on your hard disk.

- Error: "This stack has not been converted. It must be converted before it can be modified."

Manually copy the Compatibility Checker stack to the hard disk before launching it.

- Error: "You need an additional 193K of space on 'Before You Install System 7:Compatibility Checker 1.0' to use Compatibility Checker"

The Compatibility Checker displays this message when running from an unlocked floppy disk. The only option is to quit, lock the floppy disk, and try again.

For more Compatibility Checker troubleshooting information, search under "System 7: Troubleshooting Compatibility Checker Problems".

## System 7: Corrupted Suitcase and/or System File (11/94)

Revised: 11/10/94  
Security: Everyone

System 7: Corrupted Suitcase and/or System File (11/94)

=====

Article Created: 5 August 1991  
Article Reviewed/Updated: 10 November 1994

TOPIC -----

I have a corrupted suitcase and/or System file. How can I retrieve my fonts or sounds?

DISCUSSION -----

Unfortunately, we have no recommended fix. While we don't recommend it, as a last resort you may want to take the following steps:

- 1) Start from the disk tools disk.
- 2) Open the System Folder on your hard disk.
- 3) Rename your System file.
- 4) Throw the Finder in the Trash.
- 5) Empty the Trash.
- 6) Reinstall system software 7.0.
- 7) Restart from the hard disk
- 8) Open the renamed System file with Font/DA mover 4.1, holding down the option key.
- 9) Resave the fonts and sounds into new suitcases.
- 10) One-by-one, open up the fonts in System 7 by double-clicking on the suitcase, and then open the document inside that suitcase. Do not use Font/DA mover 4.1 to do this.

A bad font or sound will either cause a system crash or it won't open.

Do not reinstall the corrupted font or sound in the System Folder.  
Use the original provided by the vendor.

System 7: MS Mail "Send Note" Window Doesn't Close

=====

Article Created: 19 August 1991  
Article Last Reviewed: 30 June 1992  
Article Last Updated: 30 June 1992

TOPIC -----

My MS Mail "Send Note" window does not close when I click the close box.  
I have MS Mail, Suitcase II, and DAL extensions loaded.

DISCUSSION -----

To correct this problem, change the loading order of the extensions, so  
that DAL loads after MS Mail and Suitcase II. Another alternative would  
be to remove the DAL extension from the System Folder, if it's not needed.

This may no longer be a problem with DAL 1.3 or greater, System 7 w/  
Tune-up, and/or MS Mail 3.0.

## System 7: GemStart 030 Accelerator Ctrl. Panel Upgrade (10/94)

Revised: 10/28/94  
Security: Everyone

System 7: GemStart 030 Accelerator Ctrl. Panel Upgrade (10/94)

Article Created: 19 August 1991  
Article Reviewed/Updated: 28 October 1994

### TOPIC -----

I have a Macintosh Plus with a GemStart 030 Accelerator installed. When I open the Users & Groups control panel and then open a user icon, the window freezes. I cannot move, make changes to, or close the window, but I can access the menu bar.

Also, whenever I get a system error, I see only the upper portion of the dialog box. The lower portion isn't visible.

### DISCUSSION -----

The GemStart 030 Accelerator control panel version 1.3.3 is neither System 7 nor AppleTalk Phase 2 compatible and, therefore, may cause file-sharing and printing problems. To prevent the problem with the missing portion of the dialog box, try turning off the GemStart "Copy ROM into RAM" option.

There are two workarounds to this problem:

- MicroMac Technology, Inc. reports that GemStart version 2.03 or later is fully compatible with version 7.0 and AppleTalk Phase 2. Update the control panel with this version, which is a free upgrade.
- Until you get the update, remove the GemStart control panel from the Control Panels folder and restart the machine.

For more information, search on MicroMac Technology, Inc.

System 7: Compatibility Checker 1.0 Thinks Numeric HD Name Is ID

=====

Article Created: 19 August 1991

### Article Change History

-----

09/14/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

Compatibility Checker 1.0 doesn't run properly on a hard drive that has only numeric characters as the volume name.

### DISCUSSION -----

This is a known problem. This is a HyperCard limitation and cannot be fixed through Compatibility Checker itself. The program thinks that the numeric string, used as a hard-drive name, is a HyperCard button ID rather than a volume name.

The workaround is to rename the hard drive with a non-numeric name before running the Compatibility Checker.

## System 7: Purpose of Notification Manager

Revised: 8/18/92  
Security: Everyone

System 7: Purpose of Notification Manager

=====

Article Created: 19 August 1991

### Article Change History

-----

08/18/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

Sometimes a diamond appears next to an application in the Application menu that is running in the background. What does the diamond signify?

### DISCUSSION -----

The diamond next to a running application in the Application menu indicates that the program has a message or an alert to display. The Notification Manager lets processes running in the background notify the user of messages or alerts without disrupting the process running in the foreground.

An example of an application that uses the Notification Manager is PrintMonitor. Rather than PrintMonitor taking control of the screen and becoming the active application, PrintMonitor alternates its icon with the Apple icon in the menu bar, when it requires the user's attention. In addition, a small diamond is placed next to the application name in the Application menu.

The Notification Manager provides three alert levels:

- Polite: A blinking icon appears in the menu bar.
- Audible: The system beeps once.
- Alert Box: A dialog appears that the user must acknowledge.

## Apple IIe Card: Software Version 2.0.x Features & Changes 5/94

Revised: 5/31/94  
Security: Everyone

Apple IIe Card: Software Version 2.0.x Features & Changes 5/94

Article Created: 15 August 1991  
Article Reviewed/Updated: 31 May 1994

TOPIC -----

This article describes the new features and benefits of the Apple IIe Card Version 2.0.x software.

DISCUSSION -----

Version 2.0.x software has added many new features to the Apple IIe Card for the Macintosh LC. Here are the highlights:

The Macintosh LC IIe Card works in:

- Macintosh LC, LC II, LC III, LC 520
- Performa 400, 405, 410, 430, 450, 460, 466, 467, 550
- Macintosh Color Classic
- any future model that has an LC slot or LC-compatible slot.

To use the Apple IIe Card on a Macintosh LC II, Macintosh LC III, or Performa 400 series running System 7.1 or System 7.1P, you need version 2.2.1 of the Apple IIe Card software. You should upgrade to version 2.2.1 ONLY if you are using your Macintosh LC II with System 7.1. You can use the Apple IIe Card software version 2.2 with the original Macintosh LC, but it's not required.

### System 7 Compatibility

Version 2.0 of the Apple IIe Card software is not compatible with System 7.0. Version 2.1 is compatible with both System 6.0.8 and System 7.0.1. The Macintosh LC II requires version 2.1 of the Apple IIe Card software. Apple recommends that users use 2.1 only if they need System 7 or Macintosh LC II compatibility.

Hard Disk Support

-----

- Apple IIe files and programs can be stored on the Macintosh hard disk.
- Apple IIe ProDOS files and disks can be seen and manipulated on the Macintosh desktop.
- Apple IIe files and programs can be opened by double-clicking their icons.
- Apple IIe files can be moved, copied, renamed, and trashed in the usual Macintosh ways.

#### File Server Support

-----

If a Macintosh LC has an Apple IIe Card installed, you can connect to file servers that contain Apple IIe files and programs.

- When connected to a file server over a network, you can use AppleShare Workstation software to connect to the file server.
- Starting up from a file server (sometimes called "network booting") is much faster than it was using the original Apple IIe.

#### MultiFinder Support

-----

You can run the Apple IIe Card simultaneously with Macintosh programs, switching between them without quitting either.

#### Option Panel Changes

-----

The Option Panel works in the same way. However, many improvements have been incorporated:

- When the Option Panel is open, the menu bar can be used to access desk accessories and, if running MultiFinder, to switch to other programs.
- The Option Panel is in a movable window.
- A new combination keystroke can be assigned to open the Option Panel (in addition to using Control-X-Esc).
- The Auxiliary Slot Memory Card option in the General Controls panel has been removed. To expand the amount of memory, use the Memory Expansion Card.
- There are two new ways to limit access to the Apple IIe Prefs file:
  - The Get Info command in the Macintosh Finder can be used to lock the file to prevent any changes.
  - The file can be hidden by dragging it to the System Folder to prevent anyone from accidentally trashing it.
- The General Controls panel has been rearranged.
- The Mouse panel has two additional options to make the mouse even more sensitive to your movements.

#### Card and Slot Changes

-----

- An AppleShare Card has been added.
- A Printer Card has been added. Use this card to connect the printer to your computer either directly or over a network.
- The Network Printer Card has been removed.
- The Printer Port and the Modem Port cards both have been renamed Serial Cards. (Note that these two Serial Cards should not be used for printers; use the Printer Card instead.)

- The Serial Cards have special settings for both Apple modems.

#### Enhanced Printer Support

-----

You can print to most Macintosh-compatible printers--whether the printer is connected directly or on a network. Also, you can set up and select Apple IIe printers using simple Macintosh methods.

#### Printing Changes

-----

Once the cards, slots, and printing software have been set up, Apple IIe files are printed in much the same way as with the original software. However, the setup method has changed significantly. In the earlier version of the Apple IIe Card software, the Network Printing Card or a Super Serial Card was used. In version 2.0, the Printer Card and a Macintosh desk accessory called Chooser are used. Specific printing changes include:

- The Network Printing Card has been removed from the Option Panel.
- The Printer Card should be used for all printers, whether the printer is connected to your computer directly or over a network. The Super Serial Cards should not be used for printers.
- Regardless of the printer, when using the Printer Card, the Apple IIe program should treat the printer as if it is an ImageWriter II.
- The new printing system supports all Apple printers.
- The Macintosh Chooser desk accessory is used to select the printer.

#### Saving and Printing Apple IIe Screens

-----

- Several menu commands can be used in the Option Panel to save, copy, print, and display Apple IIe screens.

## System 7: Installing AppleShare without Installing File Sharing

Revised: 9/21/92  
Security: Everyone

System 7: Installing AppleShare without Installing File Sharing

=====

Article Created: 16 August 1991

### Article Change History

-----

09/14/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

Can I install AppleShare software on my Macintosh without installing the File Sharing software at the same time?

### DISCUSSION -----

To install AppleShare software without installing the File Sharing software, use the Installer's "Customize" option and select either "System Software for Any Macintosh" or "System Software for [your particular Macintosh model]."

Using the Installer's "Easy" option installs both AppleShare and File Sharing software.

## System 7: Installing on Macintosh Portable RAM Disk

Revised: 7/29/92  
Security: Everyone

System 7: Installing on Macintosh Portable RAM Disk

=====

Article Created: 19 August 1991

### Article Change History

-----

07/29/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

Can I use the RAM Disk on my Macintosh Portable to install System 7?

### DISCUSSION -----

Yes. The Macintosh Portable let you create and use a RAM disk. You can install System 7 on a RAM Disk for faster performance and less hard disk access, which can extend the life of the battery.

To create a RAM disk on the Macintosh Portable:

- 1) Select the Portable control panel from the Control Panels folder.
- 2) Click the box next to "RAM Disk Size" and select the size. If the size you want is not listed, select "other" from the menu and choose the desired size. Note that a minimal System 7 install for a Macintosh Portable is about 971K.

A dialog box appears telling you that the new RAM disk will be created when the system is restarted.

- 3) After closing the control panel, select Restart from the Special menu.

To make the RAM disk the Startup disk with a System Folder:

- 1) Run the Installer program as you would with any other volume.
- 2) When the installation process is finished, open the Control Panels folder and choose the Startup Device control panel.
- 3) Click the RAM disk to use as your startup volume.
- 4) After closing the control panel, select Restart from the Special menu.

Concerned about losing the information on a RAM disk? There are only two ways to erase a RAM disk on the Macintosh Portable:

- Remove all files from the RAM disk and select "none" from the "RAM Disk Size" pop-up menu in the Portable control panel.
- Remove both batteries from the Macintosh Portable.

## Macintosh: How to Slow It Down

Revised: 7/2/92  
Security: Everyone

Macintosh: How to Slow It Down

=====

Article Created: 3 June 1991  
Article Last Reviewed: 2 June 1992  
Article Last Updated: 2 June 1992

TOPIC -----

I am trying to use a Macintosh SE/30 running SoftPC, so I can download from a DOS device directly into the SE/30 through a port. My problem is that the SE/30 is going so fast that it is not reading the information I am trying to dump. Is there some way I can slow it down?

DISCUSSION -----

If you're using System 6, try launching MultiFinder and running one or more applications in the background. This should slow down processing somewhat. In System 7, just launch some applications. Turning on file sharing will also slow down processing.

AppleShare File Server: Forcing Applications to Run Concurrently

=====

Article Created: 3 June 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I tried to install a program on my AppleShare server to run concurrently. I followed the instructions (which basically were to copy it to the server folder and then restart) but cannot get it to show up on the file menu. The program is Netway 3287, which routes CMS printing to the LaserWriter Any hints?

DISCUSSION -----

It's possible to force an application to run concurrently with the AppleShare File Server, but if the application isn't already set up that way, you may run into problems. Contact CMS for the details. For contact information, search the Tech Info Library under "CMS".

## AppleTalk: Internet Router Phase I vs Phase II Fix

Revised: 9/6/91  
Security: Everyone

AppleTalk: Internet Router Phase I vs Phase II Fix

=====

Article Created: 3 June 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

We are running an AppleTalk Phase I network with six zones connected via a Banyan Vines server to an Ethernet network with a single zone. One AppleTalk zone is connected via a Hayes Interbridge to another AppleTalk network in another location. The problem is that the AppleTalk internet router won't cross the Hayes internet bridge to the AppleTalk network at the remote site. My goal is to run Microsoft QuickMail with Banyan's Quick Mail through the Hayes internet bridge to my remote site. If the Internet Router is not compatible with the Hayes internet bridge, then I must find something else.

DISCUSSION -----

You probably have an AppleTalk Phase I versus Phase II problem. Most Hayes Interbridges are Phase I devices, while an unaltered Internet Router is Phase II. An "upgrade utility" -- an INIT -- comes with the Internet Router. Once installed in the System Folder of the router CPU, the INIT lets the Router pass Phase I packets. As a short-term workaround, you can install this to get up and running.

Due to the complexity of the network, we advise upgrading all devices to AppleTalk Phase II. With the zones and routers you mentioned, the Phase II protocols will be more efficient. Usually, this upgrade can be done through software. The Interbridge is the exception: it requires a ROM upgrade.

Apple II: Conflict between Versions of ProDOS and Backup II

=====

Article Created: 4 June 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I backed up my hard disk with Backup II version 1.01, and the drive went down (total loss of data). While trying to restore from the backup I get through 13 of 34 disks, and then I get a DATE/TIME STAMP DO NOT MATCH error. I have looked for the date and time stamp bytes on the disks to no avail.

Can I fix Backup II to not look for a DATE/TIME STAMP? Which bytes should I look for on the bad disks? I have looked at the information on the disks in question and the data is there.

DISCUSSION -----

The actual problem may be with your versions of ProDOS and Backup II. Specifically, versions of Backup II before 1.1.1 are not compatible with any ProDOS version greater than 1.1.1. If your Backup II and ProDOS are incompatible, you have two options:

- Use Backup II v1.1.1, which will read your backup disks
- Downgrade ProDOS to 1.1.1.

The Date/Time stamps for a ProDOS volume reside in bytes \$1C-\$1F of block 2. Matching these against previous volumes may solve the problem.

To help you find block 2, here is a good formula for converting ProDOS blocks to DOS 3.3 sectors:

Block = (8 \* Track) + SectorOffset

|                |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
|----------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Sector:        | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | A | B | C | D | E | F |
| SectorOffset:  | 0 | 7 | 6 | 6 | 5 | 5 | 4 | 4 | 3 | 3 | 2 | 2 | 1 | 1 | 0 | 7 |
| Half of Block: | 1 | 1 | 2 | 1 | 2 | 1 | 2 | 1 | 2 | 1 | 2 | 1 | 2 | 1 | 2 | 2 |

It looks like the bytes you need are on Track 0, Sector 11 (first half of block

Macintosh Classic, Classic II: Screen Brightness Adjustment

=====

Article Created: 4 June 1991  
Article Last Reviewed: 18 May 1992  
Article Last Updated: 18 May 1992

TOPIC -----

I saw that the Macintosh Classic and Classic II's screen brightness is adjusted via System software. If I use System 6.0.3 in my Classic or Classic II, how can I control the screen brightness?

DISCUSSION -----

The Macintosh Classic is incompatible with any System Software version earlier than 6.0.7. Even if there were a way to use the Brightness CDEV with System 6.0.3, the Classic would not start up. The Macintosh Classic II needs to use System 7.01 in order to function correctly.

## Macintosh Classic: Internal Drive Questions

Revised: 11/29/95  
Security: Everyone

Macintosh Classic: Internal Drive Questions

=====

Article Created: 4 June 1991  
Article Reviewed/Updated: 29 November 1995

TOPIC -----

- 1) What is the drive seek time of the Macintosh Classic?
- 2) What is the initial interleaving?
- 3) Can dealers install third-party drives without voiding the computer's warranty?
- 4) Who makes the drives, and does Apple have multiple sources?

DISCUSSION -----

- 1) Question: What is the drive seek time of the Macintosh Classic?

Answer: The seek time for all Apple 1/3-height drives is 25 milliseconds.

- 2) Question: What is the initial interleaving?

Answer: The interleaving is based on how fast the circuits can keep up with the data flow. The Classic has an interleave ratio 1:1.

- 3) Question: Can dealers install third-party drives without voiding the computer's warranty?

Answer: As long as you make no modifications to the Classic (the dealer must use Apple's mounting scheme, not drill new holes, and the like) then yes.

- 4) Question: Who makes the drives, and does Apple have multiple sources?

Answer: Apple cannot comment on drive vendors; vendors may change from model to model. The guarantee is, however, that any hard drive will have an average access time of 25 milliseconds.

Article Change History:

29 Nov 1995 - Updated format.

16 Oct 1992 - Corrected the interleave ratio.

Security: Everyone

Macintosh: Error 51 "Unserviceable Slot Interrupt"

=====

Article Created: 4 June 1991  
Article Last Reviewed: 21 July 1992  
Article Last Updated:

TOPIC -----

What is error ID=51? I get a system bomb when I try to log on to my Ethernet network.

DISCUSSION -----

That error is: "Unserviceable slot interrupt."

In general, this type of error is caused by a corrupt operating system, Ethernet driver, or a software incompatibility between any of these and INITs or CDEVs. Try trashing and re-installing the operating system and Ethernet drivers. If that fails to solve the problem, try removing all unnecessary third-party INITs and CDEVs. If the system works at this point, re-install them one at a time and restart each time to find the culprit.

## Apple IIGS: \$8002 Error

Revised: 9/9/91  
Security: Everyone

Apple IIGS: \$8002 Error

=====

Article Created: 4 June 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I've been getting the "\$8002 error" when I drag anything over to my second partition under GS/OS 5.0.2. After pulling out other cards, I'm left with my high-speed SCSI card and my Applied Engineering memory expansion board. This is on an older GS "01" board.

DISCUSSION -----

There are two possibilities.

The first, less likely, possibility is that there is a soft error somewhere on your hard drive, and it's preventing GS/OS (actually, the SCSI driver) from reading some necessary information from the second partition. If re-installing GS/OS and the High-Speed SCSI drivers doesn't solve the problem, you probably will have to reformat the hard drive.

The second is slightly more likely: Some Applied Engineering cards use the DMA channel to move information. The IIGS has only one DMA channel, and the High-Speed SCSI card may be fighting the AE card for access to the channel.

Here are two things to try: Either turn off the DMA access on the High-Speed SCSI (DIP switch 1) or remove the AE card completely from the system and then test. I believe that Applied Engineering has an update for some of their memory cards to deal with this situation. If you find that this is the problem, try contacting them for a possible fix.

## Macintosh Plus, SE, and Classic: Speed Comparisons

Revised: 7/2/92  
Security: Everyone

Macintosh Plus, SE, and Classic: Speed Comparisons

=====

Article Created: 4 June 1991  
Article Last Reviewed: 17 June 1992  
Article Last Updated:

TOPIC -----

A Macintosh SE seems noticeably faster than a Macintosh Plus. Yet, their spec sheets show the same processor and MHz speeds.

### Macintosh SE Spec Sheet

Processor: MC68000, 32-bit internal architecture, 7.8336 MHz clock frequency

### Macintosh Plus Spec Sheet

Processor: MC68000  
1. 32-bit architecture  
2. 8 (7.8336) MHz frequency

### Macintosh Classic Spec Sheet

- Microprocessor: 8 MHz MC68000 CPU  
- Internal architecture: 32-bit

Is MHz a reliable measure of apparent speed? How does the Classic compare with each of them?

DISCUSSION -----

The clock speed of the computer is not always the overriding factor in performance. For example, a hideously-complicated program can takes an hour to draw a picture, but a better-written program can do it in ten minutes. Here, it depends on how compact the code is, not the processor speed.

The clock speeds are identical, but the software burned into ROM is different, causing the three systems to run at slightly different speeds.

The Macintosh SE is possibly 15 percent faster than the Plus, and the SE/30 is four times faster. In any event, the Classic is faster than the Plus by a maximum of 25 percent. That assumes that you're doing only those functions that have been optimized in the Classic. Usually, you'll see a slight increase in performance, and in some you'll see no difference. It all depends on what you're doing.

There are hundreds of things that influence performance. At the bit level, all three machines process a single processor instruction in exactly the same time. Things like processor caching will decrease the time it takes for that instruction to be loaded from memory, so performance increases a little there. Taking from the example above, if a routine is more compact, then it will do its job in fewer instructions. This means the system does the function faster. All this goes into determining the phrase, "...up to 25 percent faster than the Macintosh Plus."

## AppleShare Print Server: Correcting False Usernames

Revised: 2/12/92  
Security: Everyone

AppleShare Print Server: Correcting False Usernames

=====

Article Created: 4 June 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

We are using AppleShare Print Server as a server for both IBM and Macintosh computers.

But, there are occasions when an IBM user prints, and the statistics for that print job don't appear. That is, the username comes up as "Untitled", and the number of pages isn't correct. What's going on? We are using Apple and DayStar Digital cards in the IBMs. Neither card seems to make a difference.

We tried turning the server off and printing a job from the PC and then one from the Macintosh. Here's what we got: We tried using both Microsoft Word and WordPerfect (on the PC) and WriteNow and MS Word (on the Macintosh). The dialog box we got alternated between "Waiting for LaserWriter", "preparing data", and "printing" until it actually started printing the Macintosh document. There was no mention of the user or document that we were waiting for. So, it appears that the drivers are not doing what they should be.

Another server problem is that there have been occasions when a person prints a paper (on a Macintosh) and the title and username are not correct, but seem to be substituted from a previous job. For example, user "James" prints document "Thesis", and the cover sheet is correct. Then user "Sue" prints document "Junk" and the cover sheet (and name on the server log) is "James". We have replaced the server software already, and this has fixed the problem for a few days, but then it re-appears.

DISCUSSION -----

Both of these problems could be related to a single cause. Following the steps below may solve both problems:

- 1) "Uncapture" any captured printers.
- 2) Restart the server with a diskette (if this server is also an AppleShare File Server, use the Admin diskette).
- 3) Inside the ServerFolder, locate the captured printers' folders and trash them. Their names will be in the format:

Q\_<printername>\_\*

where \* could be a zone name.

- 4) Restart the server again from diskette, rebuilding the Desktop on the hard drive.
- 5) If this is an AppleShare File Server, run the Admin program from the floppy to re-prepare the hard drive and quit immediately.
- 6) Restart as usual, and recapture the printers.

This should solve any type of directory problems the server may be having, and force the Print Server to create new spool folders.

## Macintosh XL: Unwanted Shutdown

Revised: 9/9/91  
Security: Everyone

Macintosh XL: Unwanted Shutdown

=====

Article Created: 5 June 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

My Macintosh XL intermittently dims its screen and shuts off. While the screen dims, the HD still runs. The dim effect is not a normal tube shut-down. Rather, it is the XL dimming the screen just as it does when you normally choose Shut Down from the Finder's Special menu.

The problem is not application-specific and does not seem to follow any type of schedule. It seems random.

DISCUSSION -----

As the intermittent shutdown procedure is the same as a forced-shutdown (via the menu), and that procedure is stored in software rather than firmware, you are looking at a software or software-related cause. On the hardware side, you could have damaged RAM or motherboard, but it's not very likely. You would see many more problems than this if you had a failing component.

We suspect either MacWorks Plus, system software, or (possibly) an INIT or CDEV. Something is either corrupted or conflicting with another piece of software.

Try reloading MacWorks Plus and reinstalling the operating system.

Personal LaserWriter LS: Missing Excel Page Setup Options

=====

Article Created: 7 June 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

When printing from Excel 2.2 or 3.0, some of the Page Setup options are dimmed and not accessible. Do I have a problem with my Personal LaserWriter LS driver?

DISCUSSION -----

No. Microsoft Technical Support has verified that certain options under Page Setup are not accessible when printing from Excel 2.2 or 3.0 to the Personal LaserWriter LS. The inaccessible options include 75% and 50% under the Size option and the Precision Bitmap Alignment option under Printer Effects. There is no workaround at present.

Microsoft Word and Microsoft Works take full advantage of all of the Personal LaserWriter LS options.

Macintosh: Advantages of System 6.0.5 for Some Products

=====

Article Created: 1 May 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Not all Macintosh users will upgrade to System Software 7.0, choosing instead to use System Software 6.0.x. For those users, this article describes the advantages of using System Software version 6.0.5 with some Apple products, including some that are compatible with System Software 7.0.

DISCUSSION -----

The Macintosh IIcx and some display cards require system software version 6.0.5 or later. Additionally, system software 6.0.5 may be appropriate for other Macintosh systems in the installed base. System software 6.0.5 transparently coexists in networked environments with Macintosh system software versions 6.0.2, 6.0.3, and 6.0.4.

The following products require system software 6.0.5 or later:

- Macintosh IIcx
- Macintosh Display Card 8•24 and Macintosh Display Card 8•24 GC
- Third-party software or hardware products that say "Requires 6.0.5 or later" on the box.

Apple recommends 6.0.5 (or later) for the following products:

- Macintosh Portable
- Macintosh IIfx
- 32-Bit QuickDraw

Here is a brief description of the changes made in system software 6.0.5 to better support these Apple products.

- Macintosh Portable

System 6.0.5 fixes two problems associated with the Macintosh Portable.

- 1) A communications problem occurs when the Macintosh Portable is connected to serial devices.  
Symptom - The Macintosh Portable loses track of printers and modems after coming out of Sleep mode.
- 2) A power-consumption problem is encountered when the Macintosh Portable is shut down while connected to AppleTalk.  
Symptom - The battery discharges quickly when shut down under these conditions.

- Macintosh IIfx

System 6.0.5 addresses two compatibility problems.

- 1) Control-break characters received through the serial port cause a system crash.
- 2) 32-Bit QuickDraw version 1.2 is unable to use zero-width characters.  
Music programs and accented characters use zero-width characters extensively.

- 32-Bit QuickDraw

System 6.0.5 increases performance and offers additional dithering capabilities as well as support for variable-resolution PICT images.  
(Font information is stored in PICT images.)

## Macintosh: DiskTwin for Disk Duplexing

Revised: 9/9/91  
Security: Everyone

Macintosh: DiskTwin for Disk Duplexing

=====

Article Created: 5 June 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

This article is about DiskTwin, a product sold by Golden Triangle Computers, Inc.

DISCUSSION -----

DiskTwin is a Macintosh software package that works with a NuBus card and a second SCSI bus, to make a copy of the contents of a primary hard drive onto a secondary hard drive. Technically, this operation is known as disk duplexing.

Disk duplexing is a technology widely used in the mainframe and minicomputer world and in large microcomputer networks to ensure continuous operation where users cannot afford to lose any data or experience down time.

Here are the steps required to use DiskTwin:

- 1) Drop the DiskTwin control panel device (CDEV) into your System Folder.
- 2) Place the DiskTwin NuBus card in your Macintosh.
- 3) Attach a drive of the same kind as your primary disk onto the DiskTwin card. For example, if you have an Apple Quantum 80 internal, connect an Apple Quantum 80 external to the DiskTwin card.
- 4) Restart your computer, and select the drive you want to copy. The twin is invisible to the Macintosh desktop so it can't be used accidentally.

When you do need it, you can immediately mount the twin onto the desktop from the DiskTwin control panel.

DiskTwin runs continuously, creating a copy of your primary disk as often as you save to disk. DiskTwin won't slow your system. When your hard disk fails, mount the twin and you're back in business. Should the Macintosh SCSI hardware fail, your DiskTwin SCSI port remains operational.

You can find the address and phone number for Golden Triangle Computers, Inc. in a separate article in the Tech Info Library.

## System 7: No Need for HeapFixer and HeapTool Utilities

Revised: 8/18/92  
Security: Everyone

System 7: No Need for HeapFixer and HeapTool Utilities

=====

Article Created: 6 June 1991

### Article Change History

-----

08/18/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

How has memory management changed in System 7 relative to system heap and INITs? Specifically, will utilities like HeapFixer and HeapTool still be necessary for people who are running a lot of INITs?

### DISCUSSION -----

HeapFixer and HeapTool don't do anything in System 7. The system has changed such that these utilities won't be needed. The function HeapFixer and HeapTool perform is done by the new boot code in System 7. The system heap will now dynamically grow as extensions allocate more space.

HeapFixer had value with system software version 6.0.X because INITs would add to the system heap, and the heap filled up. Looking at the system bar in the About box and adjusting the size so that enough space is left over won't work any more.

The system software indicator in System 7 includes a lot more than just the system heap, so it can't be used as an indicator of how much space is currently available. And since the system heap is dynamic in System 7, even during startup, any adjustments made by the HeapFixer and HeapTool utilities will just be overridden by the system.

## System 7: Use of Virtual and Physical Memory

Revised: 9/5/91  
Security: Everyone

System 7: Use of Virtual and Physical Memory

=====

Article Created: 6 June 1991

### Article Change History

-----

08/20/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

When using System 7, why can systems that are not 32-bit compatible access 13MB of virtual memory, but only 8MB of physical memory?

### DISCUSSION -----

The memory map in a 24-bit system only allows for 8MB of RAM, 6MB NuBus, and 2MB ROM and I/O. Virtual memory will use the allocated memory of a NuBus card that is not in use. If you were to put more physical RAM in a Macintosh II running in 24-bit mode, the system would use only 8MB, and the rest would be ignored.

## System 7: Rarely Need to Initialize HD Before Installing (5/96)

Revised: 5/27/96  
Security: Everyone

System 7: Rarely Need to Initialize HD Before Installing (5/96)

Article Created: 6 June 1991  
Article Reviewed/Updated: 27 May 1996

TOPIC -----

Do I need to reinitialize my hard disk before installing System 7?

DISCUSSION -----

In most cases, there is no need to reinitialize any hard disk on which you plan to run System 7.0, unless the disk has been damaged in some way.

If you are using a third party hard drive, you should contact the manufacturer to get the suitable driver to update the SCSI driver before installing System 7.

Also, if your Apple drive was updated with an older version of Apple HD SC Setup, your partition size will be smaller, so if you then, update your drivers again with a more recent version of HD SC Setup, you will be told you do not have enough room. If you run into this situation, you will need to reinitialize your hard drive and then install System 7.

If you are planning to run Virtual Memory, use HD SC Setup version 7.0 to update the SCSI driver. This requires that you start up from the Disk Tools floppy disk, choose the target drive, and click on Update. This process takes a second or two to complete, and does not require any reformatting, or reinitializing, of your hard drive.

Note: Be sure to backup your hard drive before you initialize your drive. It is also a good idea to backup before you update to System 7.

### Article Change History:

27 May 1996 - Corrected minor typographical errors.  
30 Oct 1992 - Clarify the use of third party drives and HD SC Setup.

## System 7: Group Upgrade and Compatibility on Novell NetWare

Revised: 12/11/92  
Security: Everyone

System 7: Group Upgrade and Compatibility on Novell NetWare

=====

Article Created: 6 June 1991

### Article Change History

-----

09/15/92 - REVIEWED

- For accuracy.

12/11/92 - REVISED

- Added more compatibility information.

### TOPIC -----

Why does the System 7 group upgrade fail when using Novell NetWare server version 3.11?

### DISCUSSION -----

Version 1.1 of the Migration Guide corrects the Novell NetWare upgrade station problem. With version 1.0 of the Migration Guide, you can't use Novell NetWare servers (both version 2.15 and 386, now called version 3.11) as upgrade stations when performing System 7 group upgrades.

The problem occurs only when the creation time of the System 7 files ends in an odd-numbered second. This is due to the way MS-DOS and the Novell server keep time. They understand only even-numbered seconds. In the released version of System 7, all files have creation times with even-numbered seconds.

Versions of Novell NetWare for the Mac that are compatible with System 7 are:

- Novell NetWare 286 Server, NetWare for the Mac version 2.0 is partially compatible. Version 2.2 is fully compatible.

- Novell NetWare 386 Server, NetWare for the Mac version 3.0.1 or 3.0.1.1.

## SCSI Termination and External Hard Drives

Revised: 9/6/91  
Security: Everyone

SCSI Termination and External Hard Drives

=====  
Article Created: 14 May 1991  
Article Last Reviewed: 22 May 1991  
Article Last Updated:

TOPIC -----

I am having some problems with my Apple 160MB hard drive. I have a Macintosh IIci, two monitors, an internal HD, and a SCSI cable (which is about four feet long with one SCSI extender) with a SCSI terminator attached.

When the system is set up without the external 160MB drive, it works fine. But when I attach the drive, the Macintosh IIci won't start up. I've replaced terminators and swapped some SCSI cables. However, if I put an Apple 40MB hard drive in place of the 160MB drive, it works.

DISCUSSION -----

SCSI termination problems are difficult to diagnose. Besides the suggestions below, there are a number of other articles that may be of help by searching under "SCSI" and "termination".

- 1) Make sure the external drive is turned on before the Macintosh is.
- 2) Make sure the SCSI ID on the external drive is not set to zero. It should be between 1 and 6.
- 3) Try the 160MB drive on another machine, preferably without an internal hard disk. If it has problems it could be the cable or the hard disk.
- 4) Swap the cable and the terminator if necessary.

## AppleTalk Printing: Apple IIe Workstation Card Slot

Revised: 9/6/91  
Security: Everyone

AppleTalk Printing: Apple IIe Workstation Card Slot

=====

Article Created: 14 May 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I want to connect a Macintosh II and an Apple IIe to an ImageWriter II over AppleTalk.

A Workstation card was installed in the Apple IIe, the necessary LocalTalk cables were used, SW-4 was switched for AppleTalk, and AppleTalk was selected in the Chooser. This did not work.

I then installed AppleShare into the Macintosh II. The Macintosh now prints, but the Apple IIe does not. Instead, it gives the message "No boot server -- trying other slots".

What am I doing wrong?

DISCUSSION -----

The Workstation card must be installed in a higher-numbered slot than the disk interface card, otherwise the Apple IIe will try to start up over the network.

- If you WANT the Apple IIe to start up over the network, you must also install the Apple II Setup on the Macintosh II file server. This is a separate disk (AppleShare File Server Apple II Setup Disk). You would also need to copy Chooser.II to the server.
- If you DON'T want the Apple IIe to start up from the server, but rather to print to the ImageWriter II, then move the workstation card to a lower-numbered slot than the disk interface card and boot your workstation disk and run Chooser.II.

One other problem might be that you are running Chooser.II, getting a connection, and then inserting your application disk and restarting. This doesn't work. You have to run Chooser.II from the application disk or launch the application by pathname after running Chooser.II from the workstation disk.

Security: Everyone

EtherTalk: Troubleshooting Slow Performance

=====

Article Created: 14 May 1991  
Article Last Reviewed: 22 May 1991  
Article Last Updated:

TOPIC -----

I am having problems with an EtherTalk card running very slow on my Macintosh. My EtherTalk software is version 2.01.

DISCUSSION -----

The version that you are using should be fine, although there has been a slight upgrade to the driver in the new version, v2.02. This new version is installed by using the Network Products Installer disk and the EtherTalk 2.0 disk.

Make sure the network is properly terminated. Also, try a utility, such as Apple's Inter•Poll to track the network's performance. This will show if an unusual number of packets are getting damaged or lost.

Check software, network (termination, topology, etc.), and the card as well.

## AppleShare Print Server: Stack underflow Is PostScript Error

Revised: 9/6/91  
Security: Everyone

AppleShare Print Server: "Stack underflow" Is PostScript Error

=====

Article Created: 14 May 1991  
Article Last Reviewed: 22 May 1991  
Article Last Updated:

TOPIC -----

Are there any conflicts between AppleShare Print Server v2.01 and  
Microsoft Excel for Macintosh v2.2?

I am having difficulty printing Excel spreadsheets to a captured  
LaserWriter. I get no error messages at the workstation, but I get an  
error page with a message about a 'Stack underflow' error and the job  
doesn't print. If I print the document several times (half dozen or so)  
the job finally prints.

DISCUSSION -----

"Stack underflow" is a PostScript error. Adobe's description of the error  
is: "An attempt has been made to remove an object from the operand stack  
when it is empty. This usually occurs because some operator did not have  
all of its required operands on the stack."

There is no way a user can cause this error. The more likely problem is a  
software incompatibility. Excel 2.2 and AppleShare Print Server 2.01 have  
no known problems. To see if the problem is actually related to the Print  
Server, try a bypass print. If the same document works consistently when  
printing directly, assume there is a conflict with Print Server and  
something else.

The problem could be related to the System file on the server. Reinstall  
System 6.0.5 on the server then use the Network Products Installer disk to  
reinstall AppleShare and Print Server. This process ensures that no  
resources in the System file get downgraded in the installation process.

## AppleShare: IBM Software Can't be Fully Copy-Protected

Revised: 9/5/91  
Security: Everyone

AppleShare: IBM Software Can't be Fully Copy-Protected

=====

Article Created: 14 May 1991  
Article Last Reviewed: 23 May 1991  
Article Last Updated:

TOPIC -----

Is it true that IBM software on AppleShare server cannot be fully copy protected?

I am running an AppleShare file server (v2.01) containing a number of IBM software items. These application files have been marked as "copy protected" using the AppleShare administrator. Logging in from a Macintosh and examining the files with MacTools shows them to have the "protected" bit set. They cannot be dragged to a local Macintosh hard disk; if I try, I get the message "Cannot be duplicated or copied".

However, these items can be copied by IBM users, using normal command-line copy commands! As far as I can determine, there is no way to prevent piracy of any IBM software placed on the AppleShare server.

DISCUSSION -----

AppleShare's copy protection feature was put in as an aid for Macintosh users, and it built on an old feature of the Macintosh file system. MS-DOS is not even aware of our copy protection bits, so there is no way to get a COPY command to respect this level of protection without being extremely intrusive into the operating system (and causing a good chance of incompatibilities with future operating system releases).

We don't know of a way to keep DOS users from copying applications from the server while still having access to run the program.

One solution is to distribute applications to the individual users who need them and use the file server only for data.

Apple Serial Numbers are Mostly Random Digits

=====

Article Created: 14 May 1991  
Article Last Reviewed: 23 May 1991  
Article Last Updated:

TOPIC -----

I'm trying to track down the Macintosh model that these model and serial numbers apply to:

M5525 Macintosh IIfx? sn F3026MEAC40  
M5780 Macintosh IIci? sn F1031DBY740

DISCUSSION -----

It is sometimes impossible to tell what the factory configuration was by the model number printed (or stamped) onto the unit. The model number designates a "family" of computers and has only one absolute requirement: the first letter (M = Macintosh, A = Apple II, etc.). The other digits are essentially random.

That last 5-6 digits in the serial number usually end with the model number, for example, F1234HYD34M5000. The M5000 is the model number.

In some specific cases you can figure it out, though: there was only one Macintosh 128K, for instance. In your case, however, we can't determine what the initial configuration was (which would enable us to discover the Finished Goods part numbers, eventually).

Shiva NetSerial: Capable of NetComm "Hunt Group"

=====

Article Created: 14 May 1991  
Article Last Reviewed: 23 May 1991  
Article Last Updated:

TOPIC -----

I have an AppleTalk network (40 workstations, two servers, bridge, etc.). I need to add about 10 shareable serial ports to bridge into an existing Wang system.

Ideally, I'd like to find some device like a comm-port server; something with up to ten ports that would manage the allocation of the ports. I have considered using ten Shiva NetSerials, but I don't like the "trial and error" method of finding an available NetSerial.

Does anyone make a device like this? Apparently there is something like this in the Novell world, where a PC is dedicated to be a comm server, and manages all shared-port access. Any ideas?

DISCUSSION -----

From your description, it sounds as if you desire a network communication "hunt group"-type service, where if the first communication server is busy, it will hunt automatically for the next available communication server.

You can do this right now with the Shiva NetSerials. Simply choose all of NetSerials you wish have in your "hunt group" via the Chooser, and your call will be routed through whichever NetSerial is available. And of course, because the NetSerial is an independent (after initial configuration) network device, you won't need to dedicate a computer to manage it.

Apple IIGS: Troubleshooting "Out of RAM 04" Message

=====

Article Created: 14 May 1991  
Article Last Reviewed: 23 May 1991  
Article Last Updated:

TOPIC -----

How much memory does an Apple IIGS need to run System v5.0.2?

I was told 768K, but when I tried to boot a system disk on an Apple IIGS with an expansion board installed, and with the entire first bank populated (top line of card full, top jumper not connected, bottom one connected), I got an "out of RAM" 04 message on the Apple IIGS.

I want to run GS/OS 5.0.2 over the net from a server, but if it can't even boot standalone, what do I need to run the net? Is 768K enough? Isn't that what I have? (256 + 512 (logic + add on))

DISCUSSION -----

GS/OS should boot on a standalone Apple IIGS with 512K of RAM. If network services are going to be used, 768K is required.

Check to see if you have a RAM disk created in the Control Panel. Perhaps the RAM on the logic board or the memory expansion card is faulty; try running diagnostics. The card could be misidentifying the amount of RAM (because the jumpers aren't read correctly by the card even though they are set correctly).

## LaserWriter IINTX: Q & A on Storing Fonts on Hard Drive

Revised: 9/5/91  
Security: Everyone

LaserWriter IINTX: Q & A on Storing Fonts on Hard Drive

=====

Article Created: 14 May 1991  
Article Last Reviewed: 23 May 1991  
Article Last Updated:

TOPIC -----

I'm using a 20MB SCSI hard drive with my LaserWriter IINTX. There didn't seem to be any problems, and the Laser Installer software recognized the hard drive as being online to the LaserWriter IINTX.

Then I installed all my Laser fonts to the hard disk, but when I ran the Laser Installer software, it did not recognize any of the fonts installed to the hard disk. It did not even recognize that a hard disk was connected (although the Laser did start up with the hard drive attached, and the drive-active light was on).

The software only gave a readout of the internal laser fonts -- not those installed on the hard disk.

- 1) How do I ensure that the hard drive is correctly connected and available as a font resource?
- 2) Can I install screen fonts on the hard drive, or only printer fonts?
- 3) Do I remove all printer (and screen) fonts from the System Folder on my Macintosh after they are installed to the LaserWriter IINTX hard disk?
- 4) My hard drive crashed, and my System Folder was corrupted while I was installing screen fonts to the system file using Font/DA Mover. What might have caused this? Is there a limit to the number of screen fonts that I can have installed to the system file? Is there a limit to the number of items that I can have in any folder?
- 5) Where do I get more complete information on the installation and support

of this environment?

DISCUSSION -----

It sounds like the problem was either with what fonts were installed or the process you used to install them.

- 1) When you run the LaserWriter Font Utility, if the drive is recognized and does format, then the drive is connected properly and operational.
- 2) No, you can't install screen fonts.
- 3) You will need the screen fonts on the workstation. Downloadable fonts on the workstation are unnecessary, but do not harm anything.
- 4) There is no theoretical limit to the number of screen fonts you could install in your System file, but you would eventually run out of RAM or disk space. The limit of files per folder is 64,000.
- 5) The LaserWriter IINTX manual shows how to make the connections properly and format the disk. If these processes work, the drive is operational.

## LaserWriter IINT: Memory Allocation

Revised: 9/5/91  
Security: Everyone

LaserWriter IINT: Memory Allocation

=====

Article Created: 14 May 1991  
Article Last Reviewed: 23 May 1991  
Article Last Updated:

TOPIC -----

I have a LaserWriter IINT with 2MB of memory. I would like to download additional fonts.

What is the memory allocation for the fonts and what is taken up for the buffer out of the 2MB? When I download three additional fonts, a "not enough memory" message appears.

What can I do to download more fonts?

DISCUSSION -----

Of the 2MB of RAM in a LaserWriter IINT, 616K is used for fonts. Of this amount, approximately 500K is available for downloading additional fonts.

Although there is no memory upgrade for the LaserWriter IINT, you can upgrade it to a LaserWriter IINTX, which can be expanded to 12MB. You can also use the fonts "dynamically" -- which means they are simply placed in the System Folder and the fonts are removed and downloaded dynamically by the operating system.

Lisa: Error 38 is "No Boot File on Disk"

=====

Article Created: 14 May 1991  
Article Last Reviewed: 27 May 1991  
Article Last Updated:

TOPIC -----

When I try to boot a MacWorks disk on my Lisa, I get an error code 38.

This error is placed under an icon with a check in it. It only accesses the floppy for a brief moment and then gives the error code. It then prompts me to continue or to choose a startup device (STARTUP FROM...). When I continue, the above occurs again, over and over. If I choose a startup device, it gives me the option of the floppy only -- not the HD.

What's going on?

DISCUSSION -----

Error 38 is "No Boot File on Disk." It sounds like the MacWorks disk was erased. If the disk was good to begin with, you have a hardware problem with the floppy drive.

Apple II: Wrong Version of Setup Causes Aristotle Problems

=====

Article Created: 14 May 1991  
Article Last Reviewed: 29 May 1991  
Article Last Updated:

TOPIC -----

I'm having a problem in setting up a lab network using a Macintosh SE/30 as a server, with a combination of Apple IIGS and Apple IIe workstations. I am also using Apple II Setup v2.0.1.

I get the following error message when I try to log on to Aristotle as Administrator from an Apple IIGS: "an error occurred loading the file /volumename/System/System.Setup/Cdev.Init".

When I try using a different startup application (such as BASIC.SYSTEM), I get this message: "Bad OS ver 0011" I'm using version 5.0.2 to install Server Network Startup, and Server Quick Logoff.

Also, I've been getting a System Error when setting up a Macintosh SE/30 as a server and installing System 6.0.3 from the Install menu of the File Server installation disk. Reinstalling System 6.0.5 seems to cure this, however.

DISCUSSION -----

The problem you are seeing with Aristotle is a result of using the wrong version of the Apple II Setup. You have to use Apple II Setup v2.1 or 2.1.1, not v2.0.1, when setting up the software.

As for the problem of installing 6.0.3 from the File Server installation disk, it could be that there is something corrupted in the installation scripts for that version. Nothing you described is a wrong procedure.

AppleShare: Server Maintenance and Backup Questions

=====

Article Created: 14 May 1991  
Article Last Reviewed: 29 May 1991  
Article Last Updated:

TOPIC -----

What is the best and safest way to operate a file server? AppleShare 2.0 and an Internet router on a Macintosh IIfx.

When I need to install software on the server, I need access to the Server Folder. I have to shut down the server and start up a floppy. This presents a problem, because the Internet router is running -- which disconnects my users from printer access. I know I could move the Router to another unit, but it seems more appropriate to have it on a dedicated unit.

Also, I need to have the database users log off of the databases in order to do a clean backup, so perhaps an automatic backup software package would be better so it could run at night. Also, the backup software selected must be compatible with AppleShare's concurrent software philosophy.

Other than installing software through a remote node, I don't know of any way of installing software on an AppleShare server short of bringing the server down to do it. Secondly, it seems impossible to back up a database that is in use on a server.

DISCUSSION -----

You are correct in your assumptions of the way the system works. To install the software on the server you must bring the system down, which will cause the router to go down. The best time to do network maintenance and upgrades on a large network or on a network that cannot be brought down is at night or on the weekend.

If you back up a database file that is opened, you will not get a proper backup. Any files that are open will not be saved. It is best to do this after hours, also.

There are many backup programs that start at a specified time. That should be the best solution.

AppleTalk PC Card: Code Versions and Compatibility

=====

Article Created: 14 May 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I want to add some AT&T PCs to my AppleTalk network. I have some old AppleTalk PC cards available (part number M2313). They print all right, but I am worried about conflicts with newer versions of the LaserWriter drivers, etc.

The versions on the PC side are:

- AppleTalk PC DA 1.0
- AppleTalk PC Print driver 1.0
- AppleTalk PC Driver 2.0

Are there newer versions than these, and if so, how can I obtain them on an IBM format disk?

DISCUSSION -----

The cards are the same even though the part numbers are different. The issue is what's bundled with the card. Originally, the card had a utility to handle printing. Then the utility was removed from the package and the card was shipped alone. Currently, the card is shipped with AppleShare PC, so it has a different finished goods part number. You should have no problem using a more current version of the print driver.

The AppleTalk PC card is now referred to as the LocalTalk PC Card. For more information on this card, please contact Farallon.

## Apple II Workstation Card: Magic Slate Printing Issue (11/96)

Revised: 11/21/96  
Security: Everyone

Apple II Workstation Card: Magic Slate Printing Issue (11/96)

=====

Article Created: 14 May 1991  
Article Reviewed/Updated: 18 November 1996

TOPIC -----

When attempting to print from Magic Slate v2.0 using an Apple IIe and a Workstation Card connected to an ImageWriter II, using AppleTalk, we get the message "includeProcSet IWEm 1 1" on the printout. Is there a fix for this problem?

DISCUSSION -----

Magic Slate thinks it is talking to a LaserWriter instead of an ImageWriter II. Because the Apple II Workstation card emulates a Super Serial Card, you should select that interface in the Magic Slate program.

Also, on an Apple IIe, you always have to run Chooser.II before you run an application and without powering off the computer, see below.

- 1) Launch your Apple II workstation disk.
- 2) Choose your printer.
- 3) Quit Chooser.II, but DO NOT power off.
- 4) Launch Magic Slate by ProDOS pathname. For example,  
-/volumename/application name.
- 5) Configure Magic Slate to print to an ImageWriter at the slot that contains the workstation card.

If this doesn't work, perhaps Magic Slate is not flexible in the slot location or is clearing the Chooser.II info on launch.

Macintosh: Troubleshooting ID=10 Trap Error Bombs (4/94)

=====

Article Created: 14 May 1991  
Article Reviewed/Updated: 5 April 1994

TOPIC -----

I am repeatedly getting the system bomb "ID=10" on my Macintosh. What does it mean?

DISCUSSION -----

ID=10 is a line 1111 trap error caused by software problems. The first thing that you need to do is:

- 1) Remove all extensions (INITs) and control panels from the System Folder and restart.
- 2) If you're no longer getting ID bombs, replace the extensions and control panels, one at a time, until you get the error again. The last one put in is likely the cause of the crashes.

If you are still getting the crashes after removing everything, remove the entire System Folder and reinstall a new copy from your System disks using the Installer. If you still get the bombs at this point, determine whether this always happens when using a particular application? If so, replace that application. Also, verify that your application is the most current version available and fully compatible with your Macintosh model.

AppleShare: Slow Startups with CD-ROMs on Network

=====

Article Created: 14 May 1991  
Article Last Reviewed: 31 May 1991  
Article Last Updated:

TOPIC -----

I have a CD-ROM as a volume on my AppleShare network. I normally shut down the server on Friday afternoons and restart it on Monday morning, leaving it on all week. When I first turn on the server and get the message: "Checking volume 'CD-ROM 4.0' this may take a few minutes", it normally takes anywhere from 15 to 30 minutes for the server to come up. Lately I have seen that message for over two hours and have had to give up and restart the server without the CD-ROM. All the time the message is on the screen, the CD-ROM is being accessed, so the Server isn't locking up.

DISCUSSION -----

The newest version of CD-ROM drivers (3.0.2) speed up access to CD-ROM drives from AppleShare File Servers. Actually, the newer drivers don't let AppleShare do all of the prepping beforehand, and will provide that information on demand at a later time.

## LaserWriter II: Printing from DecNet Terminal Server

Revised: 9/3/91  
Security: Everyone

LaserWriter II: Printing from DecNet Terminal Server

=====

Article Created: 14 May 1991  
Article Last Reviewed: 31 May 1991  
Article Last Updated:

TOPIC -----

I'm looking for a product that will allow a DecNet Terminal Server to print to an Apple LaserWriter II.

DISCUSSION -----

If you want to print from a DEC VAX supporting PostScript or from Macintoshes on LocalTalk to a LaserWriter connected to a terminal server port, the following paragraphs may give you some ideas:

Attaching a LaserWriter to a DEC terminal server port is similar to attaching it to the serial port on the VAX. Normally, some steps have to be done by the VAX systems manager to define the terminal server port to be used by the queue manager.

On the Macintosh, you need a cable, with the appropriate pinouts, connecting the LaserWriter to the terminal server port. You have to set the LaserWriter communications settings, such as parity and baud rate, to the same settings as those on the terminal server port. Some installations get by with only 3-pin wiring: transmit, receive, and ground. However, you will lose data when the printer is turned off. You need full modem control port on the terminal server to support all XON/XOFF features.

On the DEC hosts, normally a virtual port is defined for the printer. A command is issued to map the virtual port to the physical port on the terminal server. The physical port on the terminal server should be set as: Accessing mode, Break disabled, Autobaud disabled, and Broadcast disabled. A print queue is then initialized with LATSYM as the name of the processor. PostScript software should be run on the VAX to support PostScript printer queuing. All DEC hosts on the Ethernet with the print

queue defined through the terminal server can print to this LaserWriter.

Only the LaserWriter IINTX can be connected to both the serial port and the LocalTalk port and be switchable between them via soft switches. To allow Macintoshes on LocalTalk to print to the LaserWriter on a VAX queue, you may want to look into PacerPrint from Pacer Software.

## Desktop Manager: Use Only on an AppleShare Server

Revised: 9/3/91  
Security: Everyone

Desktop Manager: Use Only on an AppleShare Server

=====

Article Created: 14 May 1991  
Article Last Reviewed: 31 May 1991  
Article Last Updated:

TOPIC -----

I have heard about a file called Desktop Manager, which supposedly speeds up Desktop maintenance over a network and is included with AppleShare in System 6.0 and later. I have also heard that it can be used on any Macintosh, even a single system.

Can this file be used on a single Macintosh to update the Desktop file faster? I don't have AppleShare. Can this file be distributed as a single file with proof of Macintosh ownership? Or can this file be found elsewhere?

DISCUSSION -----

We recommend using the Desktop Manager only on an AppleShare server; we do not recommend its use in any other manner.

The Desktop Manager that comes with the AppleShare File Server software is not to be distributed freely. It is part of the AppleShare File Server software and is covered by the same software licensing agreement that applies to the AppleShare File Server software.

The Desktop Manager contains an INIT that allows the server to handle directory information faster and more efficiently. This file/INIT appears to work properly with most Macintosh system configurations. The Desktop Manager causes problems with the AppleCD SC and has not been officially tested for compatibility with other software.

## Macintosh 128K and 512K: SCSI Hard Drives

Revised: 9/27/91  
Security: Everyone

Macintosh 128K and 512K: SCSI Hard Drives

=====

Article Created: 14 May 1991  
Article Last Reviewed: 27 September 1991  
Article Last Updated: 27 September 1991

TOPIC -----

Can I connect a hard drive to a Macintosh 512K?

DISCUSSION -----

To our knowledge, there is no plug-and-play hard drive for the Macintosh 512K or 128K currently still being manufactured. The Apple HD20, a non-SCSI drive which does work with the 128K and 512K Macintoshes, was made obsolete by the evolution of SCSI devices which brought about Apple's line of SCSI hard drives around the beginning of 1986. SCSI drives require a SCSI port, which is not included with a Macintosh 128, 512K or 512K Enhanced Macintosh. It was first included with the Macintosh Plus. SCSI drives transfer data many times quicker than non-SCSI drives.

In summary, you either need to find a used HD20 non-SCSI drive, or have a SCSI port installed, which would be a third-party product. Dove is one company that makes add-on SCSI ports.

WARNING: Improper installation of these kits may damage the Macintosh logic board beyond service exchangeability.

On AppleLink, you can find contact information on a company mentioned in this article by clicking the "Library Index" button in the lower-center of the Tech Info Library search window, then opening the "Third Party Company Directory" folder.

Apple IIGS: Using with a MicroNet Hard Drive

=====

Article Created: 14 May 1991  
Article Last Reviewed: 27 May 1991  
Article Last Updated:

TOPIC -----

I'm having a problem getting an Apple IIGS to talk to a MicroNet SCSI 30MB HD. I have an Apple High-Speed SCSI card, MicroNet HD, and a 1MB Apple IIGS. I also have v2.0 of the High-Speed SCSI Card Utilities.

Although my Apple II SCSI Utilities see the HD, I can't get GS/OS (v5.0.2) to see the drive.

DISCUSSION -----

Assuming the hard drive is compatible with the Apple IIGS (check with MicroNet) here's what you need to do:

Make a new bootable System Tools disk, using the Installer from the SCSI utilities disk, and specifically install the SCSI driver from the new utilities disk that came with the SCSI card. This makes the disk realize there is a SCSI device attached. As the system starts up, it looks for SCSI devices and if it finds one that should be readable but is not, it will then ask if you want to initialize.

Make sure the slot the SCSI card is installed in is properly set in the Control Panel. (That slot should say "your card".)

LaserWriter: Driver Versions and Macintosh System Versions

=====

Article Created: 14 May 1991  
Article Last Reviewed: 27 May 1991  
Article Last Updated:

TOPIC -----

I'm told that LaserWriter Driver 6.0 is associated with System 6.0.4.  
LaserWriter Driver 6.0.1 comes with System 6.0.5.

Can you use LaserWriter Driver 6.0.1 with System 6.0.4? If not, why? What about using LaserWriter Driver 6.0 with System 6.0.5?

If one Macintosh on an AppleTalk network is running LaserWriter Driver 6.0 and another is running Driver 6.0.1, will the LaserWriter be re-initialized each time one Macintosh goes to print after the other has just printed? (For instance, if one Macintosh was using Driver 5.2 and another was using Driver 6.x.x.)

DISCUSSION -----

The LaserWriter will reinitialize if it sees someone trying to print with a different version of LaserWriter and Laser Prep, regardless of the size of the difference in version numbers.

The drivers are not truly "associated" with a particular system release, they just happen to be distributed with that release. You can use 6.0.1 LaserWriter and LaserWriter Prep with System 6.0.2 if you like, just as you can use version 5.2 LaserWriter and LaserWriter Prep with System 6.0.5.

Use the suggested print driver that is best for the software, and standardize the whole network on that version to avoid loss of time due to reinitialization of the printers.

## CD-ROMs and Startup Volume's Desktop File

Revised: 9/5/91  
Security: Everyone

CD-ROMs and Startup Volume's Desktop File

Article Created: 14 May 1991  
Article Last Reviewed: 27 May 1991  
Article Last Updated:

TOPIC -----

I am told that the Desktop on the startup volume is updated every time the Finder sees an icon it doesn't already have on its own Desktop . . . but that this doesn't apply to CD-ROMs, due to the amount of info they carry.

That must mean that in the case of exploring a couple of very large capacity hard drives (like 600MB) that are SCSI-chained to a Macintosh, the desktop file on the boot volume must get really huge. And the only way to bring it back to "normal" is to rebuild it after you unchain the external drives.

Also, if there are a number of SCSI drives chained to your Macintosh that are up and running and visible on your Macintosh desktop, and then you restart the Macintosh while holding down Option-Command, what desktop files get rebuilt? Only the boot volume or the other ones as well? How would you rebuild the desktop on a non-startup external SCSI volume? (Doing it to a 3.5-inch disk is easy, but a big MacInStor won't fit in the diskette slot!)

DISCUSSION -----

You're right, the Desktop file on the volume can be huge, depending on what storage devices are attached it. On the other hand, how many of these zillions of files are actually unique? The actual file information (where it is physically, how long it is, etc.) is stored in the Desktop on that volume, not the startup volume. Only the icon (and other related) info is stored in the startup volume's Desktop.

Anyway, you can have a googleplex worth of MacWrite II documents, but the startup volume's Desktop will have only the one icon entry for all of them.

So yes, it can get really large--but probably not as big as you think.

The CD-ROM drivers have patches that keep the Finder from going bonkers over the file information there.

As for rebuilding the Desktop: the Finder looks for the Option and Command keys only during the "moment of mounting" -- which is why you can hold down the two keys while you insert a diskette, and get them rebuilt.

To rebuild attached hard drives, it's safest to just hold the keys down all the way through the startup. To do multiple drives, just keep holding the keys down until all of them are done; you'll actually get separate dialog boxes for each volume, and you can either okay (to rebuild) or cancel (to skip) -- just keep holding the keys down. It really does work. All this also means that the Finder will attempt to rebuild the volumes in mounted order, whatever that may be.

Macintosh LC: Apple IIe Card Enables Network Printing

=====

Article Created: 14 May 1991  
Article Last Reviewed: 3 June 1992  
Article Last Updated:

TOPIC -----

If I connect several Macintosh LC computers via LocalTalk connector kits and have a couple of ImageWriter printers attached, will the software recognize the printer location when using the Apple IIe emulation card?

Specifically, most standalone software for the Apple IIe looks for slot 1 to print. If I use the LocalTalk option card in the ImageWriter and connect up via LocalTalk, will it recognize the placement of the printers? Will I be able to print using the Apple IIe Card and Apple IIe software under this scenario?

DISCUSSION -----

When using the Apple IIe card in the Macintosh LC, you can print to serial devices using PR#1, and print to LaserWriters and ImageWriters on a LocalTalk network.

TOPIC -----

How can I tell if my Macintosh has a coprocessor installed?

DISCUSSION -----

If you want to know if you have an adapter (with a coprocessor) installed in your Macintosh without checking the computer physically, you need to use a software utility: nothing in the Macintosh operating system gives you this information.

There are several shareware CDEVs that report system configuration, as well as many disk and file utilities, such as SUM II and MacTest. Also, some applications (Microsoft Excel is one) report the presence of a coprocessor.

AppleShare: Installing on Macintosh IIfx/IIci

=====

Article Created: 14 May 1991  
Article Last Reviewed: 31 May 1991  
Article Last Updated:

TOPIC -----

I'm about to install AppleShare on a Macintosh IIfx. I've heard that AppleShare requires some 'patches' for the Macintosh IIfx. Is that true?

DISCUSSION -----

There's only one hitch to installing AppleShare on a Macintosh IIfx or Macintosh IIci: You need to use the Network Products Installer diskette to perform the actual installation, rather than the Installer that comes with AppleShare.

The operating system version on the AppleShare Installer diskette is too low to run on the Macintosh IIfx; the Installer on the NPI diskette is 6.0.5 (which will run), and it includes the necessary scripts to install AppleShare File Server, Print Server, Internet Router, EtherTalk, and TokenTalk.

You will still need to have the original File/Print Server (or whichever) diskettes handy, as the NPI has only the scripts, not the actual programs.

## Macintosh: Troubleshooting Error -42 tmfoErr (4/94)

Revised: 4/5/94  
Security: Everyone

Macintosh: Troubleshooting Error -42 "tmfoErr" (4/94)

Article Created: 14 May 1991  
Article Reviewed/Updated: 5 April 1994

TOPIC -----

My Macintosh keeps getting the "Error in printing this document -42". I'm using background printing under MultiFinder printing a Microsoft Works document.

DISCUSSION -----

Error -42 is tmfoErr, or a "too many files open" error. You might have reached the default maximum number of files that can be open at any one time.

During our testing of Microsoft Excel, when we reached the maximum number of open files allowed on our system (40), we couldn't create a print job nor open any other files. We got a variety of error messages: Print Monitor error, "file is damaged" error, or a Print Manager error, and "Error Printing on LaserWriter (driver version) you are using". Other programs that we tried to open trapped the system error and reported it differently.

Many programs open numerous files when launching -- 4th Dimension and Suitcase are two examples -- so you might want to investigate what you have open at the time of the error if this scenario fits.

If you're NOT encountering the maximum number of open files limit, you might have a directory problem. Try running Disk First Aid (or a similar program), or reinitialize and reinstall the software on the hard disk to see if this corrects the problem.

GIFF-to-PICT Conversion: Reduced Resolution Is Lost Lookup Table

Article Created: 14 May 1991  
Article Last Reviewed: 31 May 1991  
Article Last Updated:

TOPIC -----

Why is it that when you convert a 256 color GIFF-formatted graphics file to a PICT file, the image quality is worse (the color mapping is off)?

I've been downloading graphic GIFF files from a variety of public bulletin boards and on-line information services. I want to import these graphic images into Macintosh programs that support PICT files, using such Macintosh programs as PICTureThis and Giffer to convert GIFF files to PICT files.

Invariably, the converted PICT image is worse in image quality than the original GIFF image that is displayed on the Macintosh screen using Giffer. It appears that the colors used in the original GIFF image don't completely map to the colors displayed in the PICT image.

DISCUSSION -----

The problem is that somewhere along the line the color lookup table is being lost. The GIFF file has its own custom lookup table that is either not being converted to the PICT file, or the program used to display the PICT file is not using the custom lookup table.

Contact the vendors of the utilities you are using to see if they know of a workaround.

AppleWorks GS: How to Print Foreign Characters

=====

Article Created: 14 May 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

On an Apple IIGS, why can't I print foreign characters from AppleWorks GS to a LaserWriter?

DISCUSSION -----

The Chooser II application in ProDOS supports only the standard character set. It doesn't print foreign characters displayed on the screen. With AppleWorks GS, anything other than Draft will print as a bitmapped version of what is displayed on the screen. This allows you to print foreign characters.

The only other option is to get an application that supports foreign languages. For more information, search on "Claris".

Macintosh IIci Built-in Video: RAM Should Be Installed in Bank A

=====

Article Created: 14 May 1991  
Article Last Reviewed: 10 July 1992  
Article Last Updated:

TOPIC -----

My Macintosh IIci won't start up when a monochrome monitor is attached to the on-board video port. At first I thought it was a memory problem, so I replaced all four 256K SIMMs -- that didn't help.

Then I found that if I unplug the monitor it starts up fine. I have installed the Macintosh II video card and it works fine.

Will the Macintosh IIci internal video port work with only 1MB of RAM installed?

DISCUSSION -----

The Macintosh IIci's built-in video will function with only 1MB of RAM, provided that the RAM is located in Bank A. You will only be able to select monochrome display in the Monitors CDEV. If the RAM is in Bank B, then the Macintosh IIci ignores the video port entirely.

Macintosh IIfx Upgrade: Some Symptoms of Bad RAM

=====

Article Created: 14 May 1991  
Article Last Reviewed: 14 July 1992  
Article Last Updated:

TOPIC -----

I upgraded my Macintosh II to a Macintosh IIfx by purchasing the Macintosh IIfx logic board upgrade and two 4MB Macintosh IIfx memory upgrades.

This is actually the second logic board that I've ordered. The first was returned to Apple because it had the multichime error sound when first turned on with the full 8MB of RAM. However, it worked properly with only 4MB installed.

The second logic board has a similar problem. If 8MB of RAM is installed, the unit acts strangely. Here are some symptoms:

- The desktop is extremely slow to update at startup, particularly when it tries to read the hard drive.
- When an icon is moved, multiple remnants of the icon are left behind on the desktop.
- Inserting a locked, known good floppy disk into the drive causes a dialog "Disk is damaged and can't be used". Reinserting the same disk into a Macintosh IIci or Macintosh SE results in normal response.
- The system has trouble launching programs and eventually crashes with a system error = 03 or 10 error.
- Disks that were not write-protected were permanently damaged and could not be repaired with Norton Utilities for the Mac. When opened on any other system, the disk would indicate that it had used space, but no icons appeared.

- Disks inserted would often be missing several icons. When those same disks are inserted into other systems or this system running 4MB, all icons appear.

The interesting thing is that if the machine is reduced to 4MB of RAM populated in bank A, it works just fine. It doesn't matter which RAM chips are placed in Bank A -- as long as Bank B is empty, the system is normal.

#### DISCUSSION -----

We have heard of this problem before. It turned out to be bad RAM causing the crashes and erratic behavior. Replace the memory in the back bank with four new SIMMs of a different brand.

Macintosh Volume Drag-Copy: Why Installer May Be Needed

=====

Article Created: 14 May 1991  
Article Last Reviewed: 14 July 1992  
Article Last Updated: 14 July 1992

TOPIC -----

If I completely drag-copy an entire mass-storage volume, including the System Folder, to another volume, do I still need to use the Installer to rewrite the System on the target volume?

DISCUSSION -----

Various Macintosh models have slightly different ROM codes. The Installer determines which model it is installing to, and installs the appropriate ROM patches for each model.

If you have already run the Installer on a volume and you want to transfer that System to another volume that will be used on the same or similar computer, there should be no problem.

Also, if you do a customized install, and choose "System Software for any Macintosh", there should be no problem using that volume on different Macintosh models.

## LaserWriter IINTX: LaserJet Compatibility and Bitmapped Fonts

Revised: 9/4/91  
Security: Everyone

LaserWriter IINTX: LaserJet Compatibility and Bitmapped Fonts

=====

Article Created: 14 May 1991  
Article Last Reviewed: 31 May 1991  
Article Last Updated:

TOPIC -----

I have a Macintosh/DOS cluster running under TOPS with a LaserWriter IINTX as a common printer. The TOPS system is the latest versions. The LaserWriter IINTX is being set up as a LaserJet Plus as described in the manual.

The output from the DOS software is ragged and poorly defined. The resolution looks like it came from a dot-matrix printer (72 dpi).

If the software output is printed to a direct HP LaserJet, the quality of the output is just what I want (300 dpi).

My questions:

- 1) How fully does the LaserWriter IINTX emulate the LaserJet Plus? Is the compatibility only 80-85%, or will the LaserWriter IINTX fully become a LaserJet?
- 2) Is there a limit to the number of times the printer can be reset (resetting from a LaserWriter mode to a LaserJet mode)?

DISCUSSION -----

- 1) Adobe Systems has performed tests comparing LaserWriter IINTX and LaserJet Plus. Their finding is that a LaserWriter IINTX in LaserJet Plus emulation mode is generally faster than a LaserJet Plus, and is more than 95% compatible. The newer ROMs in the LaserWriter IINTX will increase compatibility even more.

The LaserWriter IINTX in LaserJet emulation does not fully support

LaserJet bitmapped fonts, but does support PostScript fonts. This may explain your problems with the "jagged" output, if you're using LaserJet bitmapped fonts.

- 2) The minimum number of "switches" is 100,000, if all performed via software. We don't have the number for the DIP switches, as there are too many variables to take into account.

Apple Scanner: Troubleshooting SCSI Problems

=====

Article Created: 14 May 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

When using an Apple Scanner with my Macintosh SE/30, I keep getting a message about not being able to find any device attached to the SCSI port. I checked the SCSI number to make sure we did not have any conflicts, made sure there was a terminator attached properly, checked the cable itself, and reinstalled the AppleScan software. The serial port is working fine.

The hard drive in the Macintosh SE/30 doesn't always start up the first time the computer is turned on. My dealer said that the hard drive may be the cause of the problem, and that I may need to replace a chip on the I/O board.

DISCUSSION -----

This type of problem is usually a SCSI termination problem that originates in the drive or the scanner. The problem could be with the hard drive, but not with the PROM that needs replacing. (Note: This service program is for replacement of a chip of the drive, not the drive itself.)

First try moving the terminator to another location. If the terminator is on the end of your cable, move it to the scanner's empty SCSI port. If it's on the empty port, move it to the end of the cable. If this doesn't do anything, try removing the terminator completely.

Next, check the scanner to confirm that its internal terminators have been removed. Finally, try using a different hard drive.

Macintosh: Troubleshooting a File that Won't Go Away

Article Created: 14 May 1991  
Article Last Reviewed: 26 May 1992  
Article Last Updated:

### TOPIC -----

I have been trying to delete a mysteriously named file ("tmp.aaa0034") that appeared on my Desktop after a system crash a few weeks back. I have been able to trash the document but it always reappears eventually. I have tried holding down the option key while trashing also, in case it could be locked, but again it reappears.

### DISCUSSION -----

If you trash the file, use the Empty Trash command, and the file still reappears, you have an application program that isn't cleaning up after itself very well. We're not familiar with that particular file name format, so we're not sure what application is causing the problem. We suggest reinstalling those applications you use most often, in the hopes of finally getting rid of whatever corruption there may be.

If the above doesn't work, try rebuilding the Desktop file by holding down the Command and Option keys at startup. If that doesn't help, you will probably have to reformat your hard drive.

AppleShare Print Spooler: Ways to Speed Performance

=====

Article Created: 14 May 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I'm currently running an AppleShare Print Spooler on a Macintosh Plus with an external HD20. Would the speed and throughput of the spooler be increased if I upgraded it to a faster Macintosh or if I added more memory to my Macintosh Plus?

DISCUSSION -----

Anything EXCEPT memory would increase the performance of your spooler. RAM performance improvements are incremental, but usually not enough to justify the cost of the RAM. This depends on how many utilities you may have running on your server, but if you're running a stripped-down server, you don't really need more memory.

Here are the items that will most improve the performance of your server:

- Cabling type (using Ethernet instead of LocalTalk)
- Getting a faster computer
- Getting a faster hard drive

We can't really provide any hard statistics on performance because there are far too many variables and that change from moment to moment during network use.

LaserWriter IINT ROMs: Solving Peripheral Test Problem

=====

Article Created: 14 May 1991  
Article Last Reviewed: 31 May 1991  
Article Last Updated:

TOPIC -----

I've run across a problem with Peripheral Tests, Vol. II, #1. There are LaserWriter IINT boards that work correctly but cannot be tested with this diagnostic (ROM/SIMM tests).

I recently purchased a large quantity of ROMs as I had found they were frequently the problem. Is there something I can do to make those tests work?

DISCUSSION -----

Some LaserWriter IINT I/O boards have serial chip timing problems that prevent the correct timing of the signal sent from the ROM to the serial port and back. This problem affects only the ROM diagnostic -- it has no effect on the LaserWriter's performance.

If the "No Communication" window is displayed in the LaserWriter NT/NTX ROM and SIMM Test, the I/O board may not have detected the LaserWriter II Test Connector. Check the status LEDs on the side of the printer during power up: if the Ready LED flashes briefly and then glows steady, all tests have passed and the I/O board is good.

Apple IIGS: 25-Inch Monitor Not Recommended

=====

Article Created: 14 May 1991  
Article Last Reviewed: 22 May 1991  
Article Last Updated:

TOPIC -----

Is there a way to hook-up an Apple IIGS to a 25-inch monitor?

DISCUSSION -----

Because the Apple IIGS only supports up to 640 x 200 pixel resolution (with no optional video cards available) we don't recommend adding a large screen monitor.

All you would accomplish in any case is magnifying the screen -- no desktop space would be added. Also, the enlarged screen would look grainy.

Macintosh LC: Security Connector

=====

Article Created: 14 May 1991  
Article Last Reviewed: 23 July 1992  
Article Last Updated:

TOPIC -----

The new Macintosh LC seems to have a different type of molded-in security "hole".

Previous Macintosh computers had a hole that would accommodate a clip-in metal eye through which a cable could be run and padlocked to a table. The Macintosh LC has a different kind of security connector, a "slot".

Is the security slot on the Macintosh LC the same as that on keyboards, and will the same gadgets that I now use for the keyboard still work?

DISCUSSION -----

The security connector on the Macintosh LC is best described as an underpass where the security cable would pass under a small bridge of plastic on the underside of the case.

It does not use the plug-in connector as does the Macintosh Plus keyboard.

## Macintosh XL: Connecting to a LaserWriter (10/94)

Revised: 10/17/94  
Security: Everyone

Macintosh XL: Connecting to a LaserWriter (10/94)

Article Created: 14 May 1991  
Article Reviewed/Updated: 17 October 1994

TOPIC -----

How do I connect a LaserWriter to my Macintosh XL?

DISCUSSION -----

The Macintosh XL has AppleTalk built into the ROM so you can print to the LaserWriter as you would from a Macintosh 512k. You need a DB-25 LocalTalk cable to connect to the Macintosh XL's serial port.

Once you have the cabling connected between the Macintosh XL and the LaserWriter, make sure the LaserWriters mode switch is set for "AppleTalk", use the Control Panel to make AppleTalk active, and then use Chooser to select the LaserWriter.

Here are the pinouts needed to make an adapter from a Macintosh AppleTalk Connection Module (DB-9) to a Macintosh XL connector (DB-25).

| Macintosh<br>DB-9 Female | Macintosh XL<br>DB-25 Male | Signal<br>Mnemonic |
|--------------------------|----------------------------|--------------------|
| -----                    | -----                      | -----              |
| 8                        | 19                         | RXD+               |
| 4                        | 20                         | TXD+               |
| 9                        | 3                          | RXD-               |
| 5                        | 2                          | TXD-               |
| SHIELD                   | SHIELD                     | GND                |

A word of caution is necessary. Because there are signal losses in cables longer than 18 inches, the AppleTalk Connection Module cable is supposed to be no longer than 18 inches, and the modules are constructed with an 18-inch cable already on them. There is a risk in connecting an adapter from the module to the Macintosh XL because the extra cable in the adapter might create signal losses that result in erratic operation of the Macintosh XL node. To minimize

this risk, make the adapter's wiring as short as possible.

CAUTION! To avoid FCC Class B signal violation, this cable should be fully shielded, as the data is at a very high rate and is not attenuated by the connection boxes normally used in AppleTalk.

TOPIC -----

Is it safe to print on both sides of the page when using an Apple  
LaserWriter?

DISCUSSION -----

It is NOT recommended that you print on both sides of the paper with the  
LaserWriter.

The reason for this is that when the paper passes through the printer twice  
you are heating the toner again, making it brittle. This toner can then  
break off, getting onto the rollers and then possibly being transferred to  
the next piece of paper through the printer.

It would be probably be better to use a copy machine for that.

Macintosh Display Card 4•8: Color Problems

=====

Article Created: 14 May 1991  
Article Last Reviewed: 9 June 1992  
Article Last Updated:

TOPIC -----

I have a Macintosh with a two page monochrome monitor and a Macintosh Display Card 4•8 video card.

When the control panel has the card set to black-and-white, the monitor drops pixels at random. When the card is set for four shades or 16 shades it works fine.

Is this normal, or should I replace the card?

DISCUSSION -----

That is most definitely NOT the normal function of that video card -- we would recommend replacing it, as the video memory is probably damaged. In fact, you may be able to see slight discolorations (when the monitor is in color mode) in the upper-left corner of the screen because of RAM failure. Even if you don't see the discolorations, we would advise replacing the video card anyway.

AppleShare: Permissions Not Copied Together with Folders

=====

Article Created: 14 May 1991  
Article Last Reviewed: 29 May 1991  
Article Last Updated:

TOPIC -----

I need to copy a subset of a folder hierarchy from one volume on an AppleShare server to another volume on the same server. A straight copy-via-drag did not preserve the AppleShare attributes having to do with access permissions.

What would you recommend I do to accomplish this copy without having to go into each folder copied and reset the AppleShare attributes afterwards? If it can't be done with a standard Apple product or procedure, is there a third-party package or utility that would allow me to do this in one step, short of dumping the folder tree out on a backup and then a subsequent restore?

DISCUSSION -----

Currently, as of December 1991, there really isn't a clean way of preserving access privileges for this type of copy operation.

The privileges are not stored with the files or folders, which complicates the issue. Until a better way comes along, you're going to have to manually reset them after copying.

Macintosh Classic: Should Have Internal SCSI Terminator

=====

Article Created: 14 May 1991  
Article Last Reviewed: 17 June 1992  
Article Last Updated:

TOPIC -----

I recently set up a Macintosh Classic single floppy with an external SCSI hard drive, but could not get the hard drive to boot. When I ran SCSI Probe on that Macintosh it tells me "bus not terminated".

Is the SCSI bus not terminated on the motherboard of the single drive Classic? If not, can I get a terminator that can fit on to the motherboard's SCSI port?

DISCUSSION -----

The Macintosh Classic is (or should be) self-terminated internally, through the use of an internal SCSI Terminator. This is similar to the Macintosh IIIfx Internal SCSI Terminator, and plugs into the internal SCSI port on the Classic's logic board. If you're missing the terminator, or you need to replace it, the service part number is 630-0408.

Laser Fonts: Corrupted Font Problems

Article Created: 14 May 1991  
Article Last Reviewed: 31 May 1991  
Article Last Updated:

TOPIC -----

I'm experiencing an intermittent problem when using the font "Times 12".

It sometimes does not use the whole line. No characters are lost; it simply prints the rest of the line on the next line.

Some documents do work, others don't. Generally if I take a file that does not work and either change the font style or size, it prints correctly. I tried re-installing the fonts with no success. I've taken the "bad" file and printed it on another computer and laser printer and it works!

DISCUSSION -----

This type of problem is usually caused by a corrupt font installed in the System; we would recommend at least replacing the font with Font/DA Mover, if not trashing and reinstalling the operating system with Installer.

If the problem persists, try reloading the application from diskette.

I have Apple IIGS computers (ROM version 01, 512K RAM) on an AppleShare network. When I try to logon to the server from a workstation, I get garbage on the screen that looks like:

```
                                2.1(GS/OS)
00/1179:    00 00          BRK00
A=0201      X=01E0      Y=000E      S01E2      D=0000      P=01
B=00        K=00        m=0c        Q=9E        L=1        m=0        x=0        e=0
```

This occurs about half way through the login process (thermometer bar half way across).

The settings are correct according to the manual (Slot 1 = Your card, Slot 7 = AppleTalk, Startup Slot = 7). My RAM disk is set for 256 Minimum, 256 maximum its only possible setting).

The one Apple IIGS that logs on without a problem has ROM version 3 and 1MB of RAM.

DISCUSSION -----

Your Apple IIGS computers don't have enough memory: they require 768k to run. Check your memory expansion cards and verify that they don't have more than eight chips on the cards.

## ImageWriter II: Problems Feeding Form Paper

Revised: 9/3/91  
Security: Everyone

ImageWriter II: Problems Feeding Form Paper

=====  
Article Created: 14 May 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

My ImageWriter II's four-page form paper is falling out of the sprockets when feeding. I tried cleaning the platen and the bottom guide.

DISCUSSION -----

Assuming you're not using both the friction and manual feed settings simultaneously, there's really only one adjustment you can make: Reset the clear plastic paper guide that mounts on the ribbon carriage assembly.

The rule of thumb is: Loosen the paper guide and put your four-part form AND one additional piece of paper through the printer. Press the paper guide up to the mass of paper -- not too tight -- and tighten the guide's screws. This gives the proper clearance for the four-part form plus a slight amount for margin-of-error. You may also have to run your forms with the paper bail up (not riding the platen).

Apple IIGS: Daisy Chaining DuoDisks

=====

Article Created: 14 May 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

My Apple IIGS has a 3.5-inch drive plugged in to the internal port. Can I daisy-chain a DuoDisk off the 3.5-inch drive or does the DuoDisk need its own separate controller in slot 6?

DISCUSSION -----

Older Apple IIGS computers (ROM 01), you can connect the DuoDisk directly to the SmartPort or to a drive attached to the SmartPort.

Newer Apple IIGS computers (ROM 03) need a DuoDisk interface card.

## Macintosh: Error -61 Write Permissions Error

Revised: 9/6/91  
Security: Everyone

Macintosh: Error -61 "Write Permissions Error"

=====

Article Created: 14 May 1991  
Article Last Reviewed: 21 July 1992  
Article Last Updated:

TOPIC -----

Using a Macintosh IIsi and System 6.0.7, I keep getting an error -61 when playing sound in the Control Panel, especially when recording and saving sound files.

DISCUSSION -----

A -61 error is a "Write Permissions Error" where the Macintosh System is keeping the active application from making changes to a file or directory structure. If the problem is occurring in the Control Panel, this suggests a locked file somewhere in the System Folder (basically, no System file should ever be locked) or a corrupt Desktop.

If all of the System files are unlocked and the problem persists, we recommend trashing and reinstalling the System Folder using the Installer on your system disks.

## Display Card 8•24: How to output NTSC without a converter

Revised: 7/2/92  
Security: Everyone

Display Card 8•24: How to output NTSC without a converter

Article Created: 14 May 1991  
Article Last Reviewed: 9 June 1992  
Article Last Updated:

### TOPIC -----

Can the Macintosh Display Card 8•24 be used to display images from the Macintosh on a video display or a TV without an NTSC converter?

### DISCUSSION -----

The Display Cards 8•24 and 8•24 GC do not use software for switching to the NTSC interlaced mode. To put the Display Card 8•24 into the NTSC mode, a properly configured cable is all that is required. Most NTSC devices use an RCA-type phono-connector, so this diagram uses that as a reference point.

Adjust the phono-connector side to whatever type of connector is used. "Tip" is the pin in the center of the connector (the signal); the sleeve is flanged around the outer edges of the connector (the chassis ground).

| Card Connector                              | RCA-Type Phono-Connector |
|---------------------------------------------|--------------------------|
| -----                                       | -----                    |
| 4        MON.ID1    (sense0) --             |                          |
| 7        MON.ID2    (sense1) --             |                          |
| 11       C&VSYNC.GND -----                  |                          |
| 5        GRN.VID    -----> Tip (signal)     |                          |
| Shell    CHASSIS.GND -----> Sleeve (ground) |                          |

By grounding pin 4 and pin 7 to pin 11, the video cards are told that an interlaced (NTSC) monitor is attached. The actual black and white video signal is on pin 5 and connects to the center (Tip) of the phono-plug. The shell of the card connector connects to the sleeve of the phono-plug.

To acquire a color NTSC signal from any Apple Macintosh display card, an

RGB-to-NTSC converter is required.

For more information, search under "NTSC video encoding".

## System 7: Background Printing and PageMaker

Revised: 12/11/92  
Security: Everyone

System 7: Background Printing and PageMaker

Article Created: 8 August 1991

### Article Change History

-----  
09/02/92 - REVIEWED  
    • For technical accuracy.  
12/10/92 - UPDATED  
    • To include PageMaker 4.2 information.

### TOPIC -----

I want to use background printing with PageMaker 4.0. PageMaker normally uses the Aldus drivers, which don't use PrintMonitor. Is there a way I can do this?

### DISCUSSION -----

You can use the Apple LaserWriter driver by holding down the option key, selecting print from the menu, and then clicking the print button. This uses the Apple driver instead of the APD. The next dialog will be the standard Apple LaserWriter 7.0 page setup dialog followed by the Apple LaserWriter 7.0 print dialog. If background printing has been turned on in the Chooser, it should work, but may not. Aldus Technical Support provided this information.

There are other reasons for selecting the Apple driver instead of the Aldus driver. Apple drivers will print PICT files better, whereas the APD prints TIFF and PostScript better.

Version 4.2 of PageMaker is System 7 savvy. The Aldus print drivers can take advantage of background printing unlike the prior versions.

Contact Aldus Technical Support for further clarification.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

Macintosh: Video Digitizers

=====  
  
Article Created: 3 June 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

This article describes two video digitizers available for the Macintosh.

DISCUSSION -----

MacVision 2.0

-----  
MacVision 2.0 Video digitizer, from Koala Technologies, offers 256 shades of gray and 640 x 480 resolution. It runs on a 512K or later Macintosh.

MacVision allows a user to put digitized pictures and graphics into a Macintosh, or take video images from a VCR or laserdisc player.

Here are the features of MacVision:

- Accepts any video source
- Images both flat and three-dimensional objects
- Ten different scanning techniques
- Compatible with all major software
- Works as both a desk accessory and a desktop application

ComputerEyes

-----  
ComputerEyes Video digitizer, from Digital Vision, Inc., runs on a 512KE or later Macintosh, and requires 1MB of RAM.

ComputerEyes is a hardware and software system that digitizes images from any standard video source (video camera, VCR, videodisc, and others). Under software control, the system scans the video signal and captures images into the graphics memory of the computer. It then displays images on

the screen, and allows modification with several image-manipulation options. Images are saved to disk for use with other graphics programs.

The ComputerEyes system software supports the graphics capabilities of all Macintosh computers. On a Macintosh II, images display with 256 grays for a near-photographic image. On other Macintosh systems, images display with several options of dither patterns to maximize image quality for all types of images.

Captured images may be saved to disk in a number of formats independent of the computer's display capabilities. Formats supported by ComputerEyes include MacPaint, PICT, gray-scale, and bit-mapped TIFF and Encapsulated PostScript.

With these file formats, ComputerEyes images can be imported to graphics programs, desktop publishing programs, image databases, drawing or painting programs, authoring systems, and animation programs for image display or printing.

#### Contact Information

## LaserWriter Utility: Supersedes The Namer Utility (1/96)

Revised: 1/8/96  
Security: Everyone

LaserWriter Utility: Supersedes "The Namer" Utility (1/96)

Article Created: 13 May 1991  
Article Reviewed/Updated: 8 January 1996

TOPIC -----

Is there an upgraded version of "The Namer" that allows me to name a LaserWriter under System 7.x? I have version 2.1 of The Namer application, and I keep getting the alert:

"No printer or device files can be found on your boot disk!"

DISCUSSION -----

The Namer 2.1 utility is not fully compatible with System 7.0 or later. An updated version of The Namer, 7.0 is available online. However to name LaserWriter printers, The Namer was superseded by the LaserWriter Utility. The latest version of the LaserWriter Utility is version 7.7.

The LaserWriter Utility 7.7 is backward compatible with all PostScript Apple LaserWriter printers. The latest version of the LaserWriter Utility can be found on online services.

You must continue using The Namer to name an ImageWriter II printer with a LocalTalk Option Card installed. However, because The Namer is unable to locate the printer driver in the Extensions folder of a System 7.x system folder, use the following workaround to name an ImageWriter II with a LocalTalk Option Card installed:

Step 1  
-----

Move the ImageWriter driver up one level from the Extensions folder to the System Folder. Do this by dragging the AppleTalk ImageWriter II driver from the Extensions folder to your open System folder.

Step 2  
-----

## ..TIL08289-LaserWriter\_Utility-Supersedes\_The\_Namer\_Utility\_1-96.pdf

- Launch The Namer application.
- Click the AppleTalk ImageWriter icon to search for the printer you want to name.
- Click in the Available devices window on the left to select the printer you want to name.
- Name your printer in the New Name of Device text box on the right.
- Click the Rename button.
- Quit The Namer application.

### Step 3

-----

Move the AppleTalk ImageWriter printer driver back into the Extensions folder.

## AppleTalk Internet Router: How To Install with System 7 (3/94)

Revised: 3/23/94  
Security: Everyone

AppleTalk Internet Router: How To Install with System 7 (3/94)

=====

Article Created: 9 October 1991  
Article Reviewed/Updated: 23 March 1994

TOPIC -----

How do I install Internet Router 2.0 on a System 7 Macintosh?

DISCUSSION -----

Important Note: Internet Router 2.0 is NOT compatible with System Software 7.1. Machines running System Software 7.1 will require the Apple Internet Router 3.0 Basic Connectivity Package.

If you are running a system software version prior to 7.1, then there are two ways to correctly install the AIR 2.0 Macintosh running System 7.

The best and easiest way to install the AIR 2.0 on a System 7 Macintosh is to use the latest Network Software Installer (NSI) disk. To do this, run the Installer and select the "Customize" option. Select the "AppleTalk Router (v 2.0) for System 7" option and install. The installer will ask for the AIR 2.0 disk and properly install the software.

The second method is to manually install the files from the AIR 2.0 disk. Here is the installation procedure as found on page 100 of the "System 7 Group Upgrade Guide":

- 1) Install System 7 along with EtherTalk or TokenTalk.
- 2) Insert the AppleTalk Internet Router 2.0 disk.
- 3) Open the System file on the router disk. The System window lists desk accessories and fonts.
- 4) Drag the Router desk accessory to the System Folder icon on your System 7 hard disk. A dialog asks "Put this desk accessory into the Apple Menu Items folder?"
- 5) Click OK.
- 6) Close the System window.
- 7) From the AppleTalk Internet Router 2.0 disk's System Folder, drag the

following files to your System Folder:

- LocalTalk (Modem)
- LocalTalk (Built-in)
- Router

A dialog asks, "Put these items into the places they belong?"

8) Click OK.

9) Restart your Macintosh computer.

Article Change History:

12 Jan 1994 - Updated with information on NSI.

23 Mar 1994 - Updated that 7.1 requires AIR 3.0.

AccessPC v1.1: Requires AppleCD SC Driver v3.1

=====

Article Created: 13 May 1991  
Article Last Reviewed: 31 May 1991  
Article Last Updated:

TOPIC -----

When AccessPC v1.1 is installed, I cannot mount a CD that has been formatted using the ISO 9660 File Access method. Before the CD driver can determine that a different file access method is required to mount the CD, AccessPC takes over and reports the volume an uninitialized.

I am using System 7.0 with the latest CD drivers (Apple CD-ROM extension v3.0).

DISCUSSION -----

We were able to duplicate the problem you describe. The solution is to use the latest version of the AppleCD SC drivers (version 3.1).

## EtherTalk NB Card: System 7 and Compatibility Issues

Revised: 9/10/91  
Security: Everyone

EtherTalk NB Card: System 7 and Compatibility Issues

=====

Article Created: 13 June 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Is the EtherTalk NB Card, Rev K, required for System 7 users or does it not matter?

DISCUSSION -----

System 7 does not pose any compatibility issues for EtherTalk cards. Here is a list of the Apple EtherTalk NB and Ethernet NB Cards that are compatible with the various Macintosh II class systems:

- Macintosh II or Macintosh IIX:

EtherTalk NB Card (M0410LL/A), Rev. J, K, L, or M  
Ethernet NB Card (M0417LL/A)

- Macintosh IICx, Macintosh IISI, or Macintosh IICI:

EtherTalk NB Card (M0410LL/A), Rev. K, L, or M  
(Rev L or M on Macintosh IICI with on-board video)  
Ethernet NB Card (M0417LL/A)

- Macintosh IIfx:

EtherTalk NB Card (M0410LL/A), Rev. K, L, or M (Rev J WON'T work)  
Ethernet NB Card (M0417LL/A)

Note: There is a remaining bug that affects Macintosh IICI owners who use the EtherTalk revision K card. Ethernet performance is adversely affected

when a user starts up the Macintosh IIci in 2-bit (4 colors) or more, using on-board video. To workaroud this problem, the user can use a revision L or M card, or not use on-board video (i.e. use a video card), or use only black-and-white video.

## AppleShare PC: How to Run Microsoft Mail on a UngermannBass LAN

Revised: 9/10/91  
Security: Everyone

AppleShare PC: How to Run Microsoft Mail on a UngermannBass LAN

=====

Article Created: 13 May 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

What is the most reliable setup for running and printing Microsoft Mail over AppleTalk from an IBM that is also on a UngermannBass LAN?

DISCUSSION -----

Here's what we suggest for a setup:

NOTE: There are two lines below that have a character known as the "at symbol", which is above the number 2 on most standard keyboards. When you see "<at symbol>" listed in the code below, you type in the actual symbol, not the string "<at symbol>." AppleLink does not allow use of that character in an article.

- PS/2 80
- 4MB RAM
- DOS 3.3, Windows 3.0
- an UngermannBass Card
- DayStar AppleTalk card
- AppleShare PC 2.01 software
- Microsoft Mail for DOS software.

Here's what happens when under Windows (with the UngermannBass network drivers and Windows already loaded):

- 1) Program Manager calls Mail.PIF
- 2) Mail.PIF calls MSMAIL.BAT
- 3) MSMAIL.BAT loads AppleShare PC software

4) MSMAIL.BAT starts Microsoft Mail for PC.

5) When exiting Microsoft Mail, MSMAIL.BAT unloads the AppleShare PC drivers.

A key thing you'll need to duplicate this setup is the MSMAIL.BAT file.  
Here it is:

```
echo off
D:\ASPC\LSL > nul
    if errorlevel 1 goto aspc_err
D:\ASPC\DSTARLT /NAME=DSTARLT > nul
    if errorlevel 1 goto aspc_err
D:\ASPC\ATALK > nul
    if errorlevel 1 goto aspc_err
D:\ASPC\PAP_WS > nul
    if errorlevel 1 goto aspc_err
d:\aspc\compat > nul
REM *** Memory usage for the above programs is approximately 75K bytes.
goto skip_aspc
:aspc_err
echo *** A fatal error has occurred while loading AppleShare PC. ***
pause *ASPC*
:skip_aspc
d:
cd\msmail2
mail
d:\aspc\anet remove all
```

Here are some autoexec.bat, config.sys, and Mail.PIF files:

```
config.sys
device=C:\himem.sys
device=C:\dasddrvr.sys
shell=c:\command.com /P /E:768
DEVICE=BRIDGE_B.DRV /PS80:1B
device=c:\mouse.sys /Y
device=C:\WIN3\smartdrv.sys 2048 512
device=c:\LANMAN\NETPROG\NETCICOM.DRV
files=30
BUFFERS=10
stacks=0,0
break=ON
lastdrive = z
```

```
autoexec.bat
C:\WIN3\AD-DOS.COM
<at symbol>echo off
set TEMP=C:\temp
prompt $p$g
PATH
```

```
C:\EXCEL3;d:\bat;c:\;c:\dos;c:\win3;c:\winword;D:\ASPC;c:\excel;d:\designer;c:
\
p
hon;c:\lanman\netprog
if exist %TEMP%\~????????.tmp erase %TEMP%\~????????.tmp
net start workstation
goto skip
:bad_pw
echo Please re-enter your password
:skip
net logon t7697 *
net view \\pdosrv1
if errorlevel 1 goto bad_pw
call c:\accessw\startei.bat
win
```

MS Mail Icon calls Mail.PIF. Mail.PIF has the following settings:

Program Filename: MSMAIL.BAT

Window Title: Mail

Optional Parameters:

Start-up Directory: D:\MSMAIL2

Memory Requirements: KB Required 128 KB Desired 640

Display Usage: Full Screen

Execution:

Close Window on Exit: (checked)

Advanced options...

all set to default values

The above is a simple PIF that calls MSMAIL.BAT MSMAIL.BAT follows...

```
<at symbol>echo off
D:\ASPC\LSL > nul
    if errorlevel 1 goto aspc_err
D:\ASPC\DSTARLT /NAME=DSTARLT > nul
    if errorlevel 1 goto aspc_err
D:\ASPC\ATALK > nul
    if errorlevel 1 goto aspc_err
D:\ASPC\PAP_WS > nul
    if errorlevel 1 goto aspc_err
d:\aspc\compat > nul
REM *** Memory usage for the above programs is approximately 75K bytes.
goto skip_aspc
:aspc_err
echo *** A fatal error has occurred while loading AppleShare PC. ***
pause *ASPC*
:skip_aspc
d:
cd\msmail2
mail
d:\aspc\anet remove all
```

## VideoSync: How To Use with System 7 (9/93)

Revised: 9/3/93  
Security: Everyone

VideoSync: How To Use with System 7 (9/93)

=====

Article Created: 13 May 1991  
Article Reviewed/Updated: 3 September 1993

TOPIC -----

VideoSync hangs under System 7 when I launch Monitors Control Panel and select "Options" button (with or without Option key down). When I remove VideoSync things seem to work fine.

DISCUSSION -----

VideoSync is an extension of the Monitors Control Panel. VideoSync needs to be in the same folder as the Monitors Control Panel for the VideoSync controls to show in the Options section of the Monitors Control Panel.

VideoSync stores information in its resource fork. VideoSync expects itself to be at the root level of the System Folder.

For VideoSync to work properly, it needs to be in the same folder as the Monitors Control Panel and be at the root level of the System Folder. With System 6, this isn't a problem, in fact it is the only way it will work. With System 7, you need to be a little more creative. The Monitors Control Panel doesn't resolve aliases, so an alias for VideoSync in the Control Panels folder doesn't work.

One solution is to put a copy of VideoSync in the Control Panels folder and at the root level of the System Folder. This isn't good since the VideoSync INIT is loaded twice at startup.

The best solution is to put VideoSync and the Monitors Control Panel at the root level of the System Folder and put an alias of the Monitors Control Panel in the Control Panels folder (for convenience). Then restart your Macintosh.

Those using the 8•24 GC software will have to remove it.

Article Change History:

21 August 1992 - Revised to clarify explanation of needing VideoSync in two places, and combined with another article of a similar topic.  
3 September 1993 - Added note about 8•24 GC software.

## A/UX 2.0 and 2.0.1: f77 open() Problem Workaround

Revised: 9/16/92  
Security: Everyone

A/UX 2.0 and 2.0.1: "f77 open()" Problem Workaround

=====

Article Created: 13 May 1991

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

The f77 open() BUG is a long-standing problem in the f77 I/O runtime library (libI77.a), and I have seen this problem in other f77 implementations based on UNIX System V. The reason this problem hasn't been fixed is because it doesn't show up in the Fortran Compiler Validation Suite, the principle test suite for f77.

### DISCUSSION -----

Here are two files, named err.o and open.o, you can use while waiting for a version of A/UX that doesn't have this problem. You can either include these files when linking f77 programs, or these files can replace the f77 I/O runtime library files. (Replacing the files makes them a permanent part of the f77 system.)

To include the files in an f77 link, simply add their names to the list of files being linked together by the f77 command. For example:

```
f77 -o test test.f err.o open.o
```

To replace these files into the f77 I/O runtime library, enter the following command (you must be super-user to do this):

```
ar rv /usr/lib/libI77.a err.o open.o
```

Once you replace the files in the library, any f77 programs you link will

be fixed automatically.

This has been fixed in A/UX 3.0.

## A/UX: 14-Character Filename Limit in SVFS (8/94)

Revised: 8/30/94  
Security: Everyone

A/UX: 14-Character Filename Limit in SVFS (8/94)

Article Created: 13 May 1991  
Article Reviewed/Updated: 29 August 1994

TOPIC -----

The filenames on my A/UX partition are limited to 14 characters. If the filename has more than 14 characters it's truncated to just 14.

How can I change this, so that the system lets me use a filename with more than 14 characters?

DISCUSSION -----

In A/UX, there is a 14-character limit in a filename in any SVFS (System V File System) partition. These files must be in an A/UX SVFS partition. However, UFS (Berkeley Fast File System) does not have this limit; it can be up to 255 characters long.

Copy your files to an UFS file system and rename them with a longer filename. Or, convert a SVFS into an UFS:

- 1) Back up all SVFS files.
- 2) Create a new UFS partition.
- 3) Copy the files to the new UFS partition.
- 4) Rename the files to longer filenames in the UFS partition.

## A/UX 2.0.1: Correction to CD-ROM Installation Instructions

Revised: 9/24/92  
Security: Everyone

A/UX 2.0.1: Correction to CD-ROM Installation Instructions

=====

Article Created: 13 May 1991

### Article Change History

-----

08/31/92 REVIEWED

- For technical accuracy.

### TOPIC -----

I've just received the complete A/UX 2.0.1 package and I've found some minors problems installing it.

Just as I did with A/UX 2.0, here's what I'm doing:

- 1) Initialize and partition the disk with Apple HD Setup.
- 2) Install Macintosh System 6.0.7 on the Macintosh partition.
- 3) Copy the contents of the disks "A/UX Startup" and "A/UX Startup Utilities" onto the Macintosh partition.
- 4) Launch A/UX Install from the disk "Floppy Launch".
- 5) Insert the disk "Floppy Root" at prompt.
- 6) Answer the questions and then reboot.
- 7) Launch the application "Read disk".
- 8) At this point I can't find the disk "Kernel Archive". The shipping list doesn't mention this disk. Then, I searched in the installation documentation (which is an A/UX 2.0 version and it indicates that I have to launch "Read disk".

9) Finally, I launch A/UX Startup and the installation is complete.

So, my questions are:

- What is "Read disk" for, since I don't need this application to install A/UX 2.0.1?
- Why doesn't the documentation contain an addendum to indicate the change in the installation procedure?

#### DISCUSSION -----

There is problem when installing a complete A/UX 2.0.1 from CD-ROM by following the installation instructions in the A/UX 2.0 Installation Guide.

When installing a complete A/UX 2.0.1 from a CD-ROM, ignore steps 17 through 20, and double-click A/UX Startup instead. The "Kernel Archive" disk is not included in A/UX 2.0.1, and the "read disk" is no longer needed for installing A/UX 2.0.1

## A/UX 2.0 and 2.0.1: adduser Problem

Revised: 9/18/92  
Security: Everyone

A/UX 2.0 and 2.0.1: adduser Problem

Article Created: 13 May 1991

### Article Change History

-----  
08/31/92 - REVIEWED  
    • For technical accuracy.  
08/31/92 - Updated  
    • To include information on version problem was fixed.

### TOPIC -----

Is there a bug in /etc/adduser, specifically in /usr/lib/addusersub A/UX 2.0?

### DISCUSSION -----

Yes there is a problem with the adduser in both A/UX 2.0 and A/UX 2.0.1.

When adding users in interactive mode the first available UID>=1000 is used. But if an entry in the /etc/passwd has a UID>=1000 and the password field is empty (for example, tom::1007:50:Tom van Peer,ois,,:/users/tom:/bin/ksh), this UID is used for the new user.

This has been fixed in A/UX 3.0.

## MacX 1.1: Command-B Copy Problem

Revised: 9/10/91  
Security: Everyone

MacX 1.1: Command-B Copy Problem

=====  
Article Created: 13 May 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I'm using MacX 1.1 with an HP 9000 via MacTCP. Using a Macintosh IIfx, Macintosh IIfx, and Macintosh IIfx, here is the setup:

- System 6.0.5
- MacX application, memory size 5000K
- 8MB RAM

When I do a Command-B copy in MacX to the clipboard, the graphic pastes to the clipboard only for the Macintosh IIfx--the Macintosh IIfx and the Macintosh IIfx produce a white box in the clipboard.

Any ideas on what may be causing this problem? Is the processing speed of the Macintosh IIfx and the Macintosh IIfx too slow on the network to handle the copy? I'm not copying a large or complex graphic from the HP 9000.

DISCUSSION -----

We haven't seen this problem before. We have a Macintosh IIfx running Macintosh OS 6.0.7 and MacX 1.1. For us, Command-B for copying selected area works properly. We don't see any processing speed slowdowns on Command-B Copy on our Macintosh IIfx either. There is, however, a release note on MacX 1.1 that states:

MacX requires the presence of 32-bit QuickDraw to support one feature: the conversion of color PICTs to X11 selections. If you do install 32-bit QuickDraw on your machine (or have a machine at least as new as a Macintosh IIfx), you will have this capability--MacX will offer to convert clipboard contents to color PIXMAP and COLORMAP style. If MacX can't find the 32-bit QuickDraw features, MacX will only offer to

convert to BITMAP.

Note that 32-bit QuickDraw also adds some performance enhancement and bug fixes on machines older than Macintosh IIci. Also note that 32-bit QuickDraw is built into System 7.0 and later for all machines that support Color QuickDraw.

Is 32-bit QuickDraw installed on your Macintosh IICx or Macintosh IIX?

Since Command-B was not described very clearly, here are steps to follow:

- 1) In MacX, do "Command-B" or select "Copy Screen to Clipboard" from the Window menu. The mouse pointer becomes '+' sign.
- 2) Select whatever area of screen you want. The selected area (graph or text) will be copied to the Clipboard.

## A/UX: Missing Toolbox ROM Routines (9/94)

Revised: 9/9/94  
Security: Everyone

A/UX: Missing Toolbox ROM Routines (9/94)

Article Created: 13 May 1991  
Article Reviewed/Updated: 8 September 1994

TOPIC -----

Using A/UX 3.0, I can't compile my programs because four routines aren't found by the linker.

Here's a sample program that demonstrates missing routines:

-----ttt.c-----

```
#include <printing.h>
#include <osutils.h>

main()
{
    int      rom,machine;

    GetDateTime();
    Environs (&rom, &machine);
    PrStlInit();
    PrDlgMain();
}
```

-----Makefile-----

```
# makefile for testing ttt.c

CFLAGS = -O -I /usr/include/mac -B /usr/lib/big/
LDFLAGS = /usr/lib/low.o -lmac_s -lat -lld -lmr -lc_s /lib/crtn.o \
        /usr/lib/low.ld

SRC = ttt.o
```

```
ttt: $(SRC)
      ld /usr/lib/mac crt0.o /lib/crt2.o -o ttt $(SRC) \
      $(LDFLAGS)

-----StdOut/StdErr-----

$ make
      cc -O -I /usr/include/mac -B /usr/lib/big/ -c ttt.c
      ld /usr/lib/mac crt0.o /lib/crt2.o -o ttt ttt.o \
      /usr/lib/low.o -lmac_s -lat -lld -lmr -lc_s /lib/crtn.o
```

/usr/lib/low.ld

| undefined | first referenced |
|-----------|------------------|
|-----------|------------------|

| symbol | in file |
|--------|---------|
|--------|---------|

|             |       |
|-------------|-------|
| GetDateTime | ttt.o |
|-------------|-------|

|          |       |
|----------|-------|
| Environs | ttt.o |
|----------|-------|

|           |       |
|-----------|-------|
| PrStlInit | ttt.o |
|-----------|-------|

|           |       |
|-----------|-------|
| PrDlgMain | ttt.o |
|-----------|-------|

ld fatal: Symbol referencing errors. No output written to ttt

Make: \*\*\* Error: Update of ttt terminated with exit code 13

Make: [line 10 in /home/dumais/Makefile]

-----

I've found alternate ways of getting the time and the machine type, but I can't find a solution for the printing routines.

Where are these routines implemented in A/UX? I have searched the /usr/lib/libmac.a and /usr/lib/libmac\_s.a libraries for the missing routines.

#### DISCUSSION -----

In A/UX 2.0, 2.0.1, and 3.0 we have verified this problem. The above A/UX Toolbox ROM routines are not included in any of the Macintosh libraries and aren't supported by A/UX.

## Macintosh: Printing from Macintosh OS Via A/UX Spooler (4/95)

Revised: 4/26/95  
Security: Everyone

Macintosh: Printing from Macintosh OS Via A/UX Spooler (4/95)

=====

Article Created: 13 May 1991  
Article Reviewed/Updated: 26 April 1995

TOPIC -----

Can I use an A/UX spooler (Berkeley or System V) to spool AppleTalk printing? For instance, if I'm running under the Mac OS and want to print to a LaserWriter, can I access a spooler on A/UX (as A/UX can do for other UNIX systems)?

DISCUSSION -----

The Columbia AppleTalk Package for UNIX (CAP) from Columbia University does what you want. The CAP package includes CAP libraries and utility programs like:

look - finds and reports AppleTalk entities on the network.

looks - finds "LaserWriters" on the network and returns their status.

papif - spools jobs from UNIX to a LaserWriter over AppleTalk

lsrv/lwsrv/iwsrv - receives jobs from Macintosh by pretending to be a LaserWriter or AppleTalk ImageWriter.

AUFS - stands for AppleTalk Filing Protocol UNIX File Server. It is the server implementation of AFP running on UNIX corresponding to Apple's AppleShare server for the Macintosh. AUFS is not AppleShare, however. AUFS requires that the AppleShare workstation software be installed on the client Macintosh.

For more information about CAP and Kinetic Internet Protocol (KIP), including where to get them, search under "CAP and KIP".

## A/UX 2.0.1: No Toolbox Change from A/UX 2.0

Revised: 9/4/92  
Security: Everyone

A/UX 2.0.1: No Toolbox Change from A/UX 2.0

Article Created: 13 May 1991

### Article Change History

-----  
08/31/92 - REVIEWED  
•For technical accuracy

### TOPIC -----

I need a list of all Macintosh OS managers not supported under A/UX 2.0.1.

### DISCUSSION -----

According to A/UX Engineering, there are NO changes in the support of A/UX Toolbox from A/UX 2.0 to 2.0.1. Therefore, the ROM library support information in "A/UX 2.0 Toolbox: Macintosh ROM Interface" documentation is still accurate.

The following are ROM libraries NOT supported by A/UX 2.0 Toolbox:

- Apple Desktop Bus
- Deferred Task Manager
- SCSI Manager

The following are PARTIALLY supported by A/UX 2.0:

- AppleTalk Manager
- Event Manager, Operating System
- File Manager
- Gestalt facility
- Script Manager
- Segment Loader
- Serial Driver
- Slot Manager
- Sound Manager
- Utility, Operating System
- Vertical Retrace Manager

The following are supported, but the FUNCTIONALITY is not identical:

- Event Manager, Toolbox
- Floating-Point Arithmetic and Transcendental Functions Packages
- Shutdown Manager
- System Error Handler
- Time Manager

For more detailed information, refer to Chapter 5 of Inside A/UX Macintosh in A/UX Toolbox: Macintosh ROM Interface documentation.

## GNU C compiler for A/UX: Where To Find It

Revised: 9/16/92  
Security: Everyone

GNU C compiler for A/UX: Where To Find It

=====

Article Created: 13 June 1991

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

Where can I find the latest version of the GNU C compiler for A/UX?

### DISCUSSION -----

The GNU C compiler for A/UX, a public domain program, is available on both aux.support.apple.com (130.43.6.2) and afsg.apple.com (192.1.34.2) systems via 'anonymous' ftp.

If you are on the Internet, 'ftp' to either of the systems, in aux.support.apple.com, do 'cd aux.patches/unsupported/2.0', in afsg.apple.com, do 'cd pub'

The files you need are:

README.gcc  
gcc-1.39.bin.tar.Z

## A/UX 2.0.1: Description of the International Script Manager

Revised: 9/16/92  
Security: Everyone

A/UX 2.0.1: Description of the International Script Manager

Article Created: 13 June 1991

### Article Change History

-----  
08/31/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

I need a detailed description of the relationship between the International Script Manager and A/UX.

### DISCUSSION -----

According to A/UX Engineering, the following functions and procedures of Script Manager are currently supported under A/UX 2.0.1:

```
PROCEDURE KeyScript (scriptCode: Integer);  
FUNCTION CharByte (textBuf: Ptr; textOffset: Integer): Integer;  
FUNCTION CharType (textBuf: Ptr; textOffset: Integer): Integer;  
FUNCTION Transliterate (srcHandle, dstHandle: Handle; target: Integer;  
                        srcMask: LongInt): Integer;  
FUNCTION GetScript (script, verb: Integer): LongInt;  
FUNCTION SetScript (script, verb: Integer; param: Longint): OSErr;  
FUNCTION GetEnvirons (verb: Integer): LongInt;  
FUNCTION SetEnvirons (verb: Integer; param: LongInt): OSErr;
```

Other functions and procedures of Script Manager under Macintosh OS Toolbox (Inside Macintosh Volume V pages 293-322) are not supported.

## A/UX: TextEditor Problem (8/94)

Revised: 8/30/94  
Security: Everyone

A/UX: TextEditor Problem (8/94)

=====

Article Created: 13 June 1991  
Article Reviewed/Updated: 29 August 1994

TOPIC -----

I just found a new small bug in A/UX. This bug appears when using TextEditor with an extended keyboard. If you hit the HELP key, an alert appears on the screen. In this alert you can read:

Unable to open the help file "MPW.Help".  
#OS error -43 (Error message file not available)

DISCUSSION -----

I have verified the problem. It is a TextEditor bug on both A/UX 2.0 and 3.0.

## A/UX: Manual Pages of launch(1) are Wrong (8/94)

Revised: 8/30/94  
Security: Everyone

A/UX: Manual Pages of launch(1) are Wrong (8/94)

=====

Article Created: 13 June 1991  
Article Reviewed/Updated: 29 August 1994

TOPIC -----

I'm using launch to start Macintosh Applications from a motif menu in a rooted MacX, mwm window. I'm having difficulty with this due to differences between the manual pages and the /mac/bin/launch executable. Specifically, under both A/UX 2.0 and 2.0.1, the manual page for launch[1] gives the options of:

```
launch -p[it] filename document...
```

Commando gives the same options. The usage provided by the command is:

```
usage: launch [-padr] appName [docName ...]
```

Is this a bug?

DISCUSSION -----

There is a conflict with the usage of launch(1) between the manual page and the launch program itself. The usage of manual pages of launch(1) are wrong. This is resolved in A/UX 3.0

Article Change History:  
29 Aug 1994 - Updated for A/UX 3.0.

A/UX: Powerfail Feature Not Supported

=====

Article Created: 13 June 1991

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

I want to use the powerfail calls in A/UX 2.0. I want to use the /etc/powerfail script to clean up when someone pulls the plug on a computer (or hits the reset programmer's switch).

Can the /etc/powerfail script be used this way? Will the system have enough time to execute these commands?

### DISCUSSION -----

The /etc/powerfail doesn't work under A/UX because the Macintosh hardware doesn't have enough backup battery power.

Sony GDM-1901-12 Monitor: Incompatible with Macintosh

=====

Article Created: 13 May 1991  
Article Last Reviewed: 31 May 1991  
Article Last Updated:

TOPIC -----

Can I connect a Sony GDM-1901 (from Masscom) monitor to my Macintosh?

DISCUSSION -----

Sony's tech support has stated that no version of the GDM-1901 will work on any Macintosh.

The GDM-1901 was an OEM product from Sony to a variety of vendors. It is now an obsolete product. When these were manufactured each vendor specified their requirements for timing to Sony; thus, each vendor's version of the GDM-1901 is specific to that vendor's computer system. To find out more about a particular vendor's version, contact Sony's monitor tech support at 408-944-4181.

## Macintosh LC: Jumpers are for Apple IIe Card

Revised: 6/21/94  
Security: Everyone

Macintosh LC: Jumpers are for Apple IIe Card

=====

Article Created: 13 May 1991  
Article Reviewed/Updated: 21 June 1994

TOPIC -----

What are the three jumpers for on the logic board of the Macintosh LC? I believe one is for the Apple IIe card, but I'd like to know what the other two do.

DISCUSSION -----

Installation of a jumper connection on the third set of jumper pins (the ones closest to the "CPE" silk screen marking on the logic board) locks out the Control Panel of the Apple IIe card. The other two sets of jumper pins are reserved by Apple and should never be connected. These jumpers also exist on the Macintosh LC II and Performa 405 logic boards, however the silk screen reads "J17".

When the jumper is installed on the logic board, users will continue to have access to the following Apple IIe Option Panel buttons:

- Quit IIe
- Eject Disk
- Restart IIe
- Return

However, users will not have access to any of the panels used to change Option Panel settings.

Article Change History:  
21 June 1994 - Updated to include information on LC II and Performa 405.

System 7: No Need to Install the Communications Toolbox

=====

Article Created: 13 May 1991

### Article Change History

-----

09/14/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

Do I still need to install the Communications Toolbox with System 7?

### DISCUSSION -----

With System 7.0, you no longer need to install the Communications Toolbox. Everything that previously needed to be manually installed into the System under the 6.0.x is now included with System 7.0.

Also, there is no longer a Communications Folder. All tools are placed in the Extensions Folder instead. If you are upgrading from System 6.0.x to System 7.0, move the tools to the Extensions Folder and delete the Communications Folder.

The System 6.0.x version of the Communications Toolbox is 1.0; only minor changes were made for System 7.0, and that version is labeled 1.0.1. As long as you have the latest version of System 7.0 you'll have the latest version of the Communications Toolbox.

## Macintosh Portable: Screen Dimming with System 7.0 on Network

Revised: 7/29/92  
Security: Everyone

Macintosh Portable: Screen Dimming with System 7.0 on Network

=====

Article Created: 13 May 1991

### Article Change History

-----

07/29/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

I cannot get my Macintosh Portable to dim its screen under System Software 7.0. No matter what the Macintosh Portable Control Panel settings are, the screen never dims. The hard drive does spin down at the appropriate time, however.

### DISCUSSION -----

The reason the screen does not dim is because dimming of the screen will disable your AppleTalk connection, so the decision was made for Macintosh Portable computers connected to a LocalTalk network that the screen will not dim even if the "sleep" timers expire.

If you are not connected to a LocalTalk network, make AppleTalk inactive, and the screen will dim as you would normally expect. Of course, based on the above information, if you are connected to a LocalTalk network you do not want the screen to dim.

## System 7: Edition Manager Edition Files

Revised: 9/22/92  
Security: Everyone

System 7: Edition Manager Edition Files

=====

Article Created: 13 May 1991

### Article Change History

-----

09/22/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

I have a question about how edition files are handled. I experienced the following with both Excel and Resolve:

- 1) Open a spreadsheet.
- 2) Make some columns of data.
- 3) Publish them on my local hard disk.
- 4) Close the spreadsheet, saving changes so the edition file remains.
- 5) Move the edition file to a different place on the hard disk. When I open, modify, and close the spreadsheet, the edition file is properly updated (just to see that the spreadsheet can follow the edition).
- 6) Close the spreadsheet, mount a file server, and copy the edition file to the file server, deleting the edition file on my local hard drive after the copy is complete.
- 7) Open the spreadsheet.

At this point, the application creates a new edition file in the location that the local edition file was last placed, ignoring the edition file on the file server.

Is this behavior application-specific, or is System 7.0 doing this? Am I doing something wrong?

DISCUSSION -----

When an application opens a document, it registers every publisher contained within that document with the Edition Manager. If the Edition Manager cannot find the edition, it creates an empty edition in the last known location, and informs the application that it needs to write to this new file.

Therefore, this is standard behavior enforced by the Edition Manager, and applications using the Edition Manager will most likely conform to this behavior.

For more information, consult "Inside Macintosh", volume VI, pp 4-19.

## HD SC Setup: Multiple Macintosh Partitions (7/93)

Revised: 7/19/93  
Security: Everyone

HD SC Setup: Multiple Macintosh Partitions (7/93)

Article Created: 13 June 1991  
Article Reviewed/Updated: 16 July 1993

TOPIC -----

Is it possible to use HD SC Setup to partition Apple drives for two different versions of the Macintosh OS? Does Apple support multiple Macintosh operating systems on a partitioned hard disk?

DISCUSSION -----

Yes, you can partition one hard disk into multiple partitions having different versions of the Macintosh operating system. However, the HD SC Setup will only allow one of the partitions to be a Macintosh OS partition. This doesn't mean that Apple doesn't support multiple Macintosh OS partitions on the same hard disk. Third-party utilities allow multiple Macintosh partitions and we've never heard of problems with them.

In most cases the typical Macintosh user will equate the terms volume and hard drive. If a hard drive has been partitioned into multiple Macintosh volumes then it's important to distinguish between the terms. Each partition will look like a volume to the operating system. Apple doesn't recommend putting more than one System Folder on a volume. If one hard drive contains multiple partitions then there's no reason why each partition couldn't have a System Folder on it. This would be no different than having multiple hard drives attached, each with a System Folder on it.

Third-party products such as Cobra software or SilverLining can do this. Be aware that many third-party drive software developers are either revising or have already revised their software for System 7.0 compatibility. Be sure you use a version that the developer explicitly states support for System 7.0

Article Change History:

07/16/93 - Revised to expand an explanation of Apple support for multiple Macintosh operating systems on a partitioned hard disk.

## HyperCard IIGS: Script for Setting TextColor

Revised: 9/10/91  
Security: Everyone

HyperCard IIGS: Script for Setting TextColor

=====

Article Created: 13 May 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

What is the HyperCard IIGS script to highlight text on a card field to a certain color?

DISCUSSION -----

Field properties (as listed and documented in the HyperTalk Beginners Guide) include frameColor and textColor. FrameColor cannot be changed using a script.

TextColor can be changed to one of the sixteen current colors in the colorSet. Here is the script:

```
set the textColor of card field field1 to n
```

where n is a number from 1 to 16. The highlight color is always black; the text within the highlight becomes the compliment of the textColor.

Note: Be careful about being misled by the actions of the "color" section of the "field info" dialog where the highlight color is the same as the textColor and the text within the highlight becomes white.

StyleWriter: Use Of Power Converter Suggested Overseas

=====

Article Created: 13 May 1991  
Article Last Reviewed: 31 May 1991  
Article Last Updated:

TOPIC -----

Is a power adapter or transformer necessary to use the StyleWriter in Europe and the Soviet Union? This is to convert 110/60 to 220/50.

DISCUSSION -----

While it is possible to run the StyleWriter on 220V/50Hz with the aid of a power converter (see the AppleLink Tech Info Article "Using Apple Equipment Overseas"), the cleanest solution would be to purchase an Apple AC Adapter (transformer) appropriate to the local power conditions.

Transformers of all kinds can be ordered by any Authorized Service Provider. The current service price list shows transformers available for the following areas:

|           |           |
|-----------|-----------|
| USA       | 699-2050  |
| Japan     | J699-2050 |
| UK        | B699-2050 |
| Australia | X699-2050 |
| Europe    | Z699-2050 |

If you don't have time for a local service provider to order the transformer, it can be purchased from an Apple dealer at your destination.

LaserWriter: How To Determine PostScript Version, ROM Revision

=====

Article Created: 13 May 1991  
Article Last Reviewed: 31 May 1991  
Article Last Updated:

TOPIC -----

Is there a way to determine the version of the PostScript driver on an Apple LaserWriter?

Is there a way to determine the disk driver version on the Hard Drive?

Is special software is used to determine either of the above?

DISCUSSION -----

To determine the PostScript version and ROM revision levels on a LaserWriter, use the code below in a PostScript dump utility. We used PostHaste, but there are many others. Microsoft Word 4.0 will also send PostScript directly to the printer.

```
serverdict begin 0 exitserver
/Helvetica findfont
15 scalefont
setfont
/str 40 string def
72 700 moveto
(LaserWriter Name:  ) show
statusdict begin str printername show
72 675 moveto
(PostScript version:  ) show
statusdict begin version show
72 650 moveto
(ROM revision level:  ) show
statusdict begin revision str cvs show
showpage
```

The output will look something like:

LaserWriter Name: xxxxxxxxx

PostScript version: xx.x

ROM revision level: x

Determining the version of a disk driver is different for each manufacturer. As far as we know, there is no package that will return the information on any drive.

## Personal LaserWriter LS: Total Effective RAM

Revised: 9/11/91  
Security: Everyone

Personal LaserWriter LS: Total Effective RAM

=====

Article Created: 13 May 1991  
Article Last Reviewed: 31 May 1991  
Article Last Updated:

TOPIC -----

I understand that with the standard 256K RAM, the Personal LaserWriter LS will effectively appear to have 1.5MB. With the addition of the 1MB upgrade, does one get an effective 2.5MB RAM?

DISCUSSION -----

The compression/decompression scheme allows the Personal LaserWriter LS to image documents that would not normally fit in 512K of RAM. The amount of compression depends on the image, and is not really predictable. Apple's testing showed that the only pages that could not fit in the standard RAM (U.S. Letter paper) were graphics containing patterns that don't lend themselves to effective compression. It was somewhat easier to overflow RAM when printing on legal sized paper.

With the additional RAM installed (making the total 1MB), Testing was unable to find a document that the printer would not image.

## LaserWriter Driver: Missing BoundingBox Parameters

Revised: 9/11/91  
Security: Everyone

LaserWriter Driver: Missing BoundingBox Parameters

=====

Article Created: 13 May 1991  
Article Last Reviewed: 31 May 1991  
Article Last Updated:

TOPIC -----

Why doesn't Apple software put values in the PostScript EPS file for the BoundingBox parameter? How can I get values inserted there if they cannot be generated? I need this info for output to DEC PostScript printers.

Sample output:

```
%!PS-Adobe-2.0
%%Title: Clone of Contacts
%%Creator: PrintMonitor
%%CreationDate: Wednesday, May 8, 1991
%%Pages: (atend)
%%BoundingBox: ? ? ? ?
%%PageBoundingBox: 30 31 582 761
```

DISCUSSION -----

The %%BoundingBox comment is a PostScript document structuring convention (DSC) used mainly for Encapsulated PostScript Files (EPSF). Its primary purpose is to inform an application importing the EPSF of the actual page mark boundaries. This allows the application to properly prepare for, and clip, the imported image. BoundingBox coordinates are determined by computing the smallest rectangle that would enclose the sum of all pages in a job. This rectangle's coordinates are based on PostScript's default user space: origin at the lower left, with X increasing to the right and Y increasing to the top.

As an example, consider a two-page document. Given the following enclosing coordinates of page 1 and 2, the BoundingBox is the rectangle that completely encloses the sum of both pages:

|             | Lower |     | Upper |     |
|-------------|-------|-----|-------|-----|
|             | Left  |     | Right |     |
|             | X     | Y   | X     | Y   |
| Page 1      | 95    | 102 | 500   | 700 |
| Page 2      | 120   | 225 | 557   | 600 |
|             | ---   | --- | ---   | --- |
| BoundingBox | 95    | 102 | 557   | 700 |

The LaserWriter driver doesn't include the BoundingBox coordinates because it doesn't know what they would be at the time the BoundingBox comment must be generated. We would have to run through the entire print job once to compute the BoundingBox, and then a second time to actually print the document. That would be very slow. What you see instead is that BoundingBox is sent with its question mark arguments, but PageBoundingBox is computed for the first page and sent with the job. Since PageBoundingBox only applies to a single page, its values can be computed for the first page as it is generated. It has little real value in the context of a large (multi-page) document, but it is still included, mainly for historical reasons. We've supplied it since the early versions of the LaserWriter driver.

The only way to create usable BoundingBox numbers would be to supply those that enclose the largest possible rectangle. This would ensure that nothing is ever clipped by the receiving program. The outside borders of any page can be defined by the following BoundingBox:

|  | Lower |   | Upper |     |
|--|-------|---|-------|-----|
|  | Left  |   | Right |     |
|  | X     | Y | X     | Y   |
|  | 0     | 0 | 612   | 792 |

Therefore, supplying these numbers as the BoundingBox would be valid for any printable page or job. Unfortunately there is no simple way to substitute these numbers for the question marks currently used. If the print job were dumped to a disk file, it could be edited to include the numbers, but this seems like it would be very annoying for multiple print jobs.

It seems unlikely that the BoundingBox comment is absolutely required for DEC laser printers, so it would help to know that the information was needed for a spooler or some printer host software. PostScript itself doesn't generally use the BoundingBox comment. As mentioned earlier, it is used so that importing software can know what to expect, and sometimes for spooling software.

It's important to note that our LaserWriter driver performs many PostScript operations that are not compatible with the EPSF format. This is not in any way abnormal for a print driver, but the result of importing a complete LaserWriter job in another document would produce very unpredictable results. The files generated by the LaserWriter driver are not EPSF compliant.

Ethernet: Minimum Packet Lengths and cisco Routers

=====

Article Created: 13 May 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

What is the minimum length of an Ethernet packet?

Since AppleTalk frequently uses small packets for NBP, ZIP, and so forth, does it pad packets to this "minimum" length?

Are there any known interoperability issues with cisco routers, AppleTalk, and minimum length packets?

DISCUSSION -----

The IEEE 802.3 standard specifies that the minimum length of an Ethernet packet is 60 bytes. If the total length of a packet is less than 60 bytes, pad bytes must be added after the data to bring the packet size up to 60 bytes.

An additional four-byte cyclic-redundancy check (CRC) is appended to the end of the packet and is checked by the receiver to determine whether an error occurred.

Traffic less than 64 bytes in length (60 byte packet plus a four-byte CRC) is considered an error by cisco routers and is ignored.

## InBox: Using with Macintosh System Software 7.0

Revised: 7/23/93  
Security: Everyone

InBox: Using with Macintosh System Software 7.0

=====

Article Created: 13 June 1991  
Article Reviewed/Updated: 22 July 1993

TOPIC -----

Can I use InBox with the file sharing capabilities of Macintosh System Software 7?

DISCUSSION -----

The following is from Sun Select (formerly Sitka Corporation):

Sun Select Tech Note 1404: InBox and Apple's System 7.0

Sun Select- 5/22/91

InBox and Apple's System 7.0 InBox for Macintosh and InBox Plus for Macintosh provide full messaging, routing and administrative functionality under Apple System 7.0. Follow the instructions below to install and use InBox under System 7.0.

Upgrading an InBox Client from System 6 to System 7.0

- 1) If InBox is installed as a Desk Accessory, use the Font/DA Mover to remove the InBox DA.
- 2) Use the Apple Installer to upgrade to System 7.0.
- 3) If the Apple Installer moved the InBox INIT to the Control Panels Folder, drag it back to the root level of the System Folder.
- 4) Drag the InBox Preferences file from the Preferences Folder to the root level of the System Folder.
- 5) If you wish to access InBox from the Apple Menu, drag the InBox application into the Apple Menu Items Folder. Do not install the InBox DA

into the Apple Menu Items Folder. The InBox DA should not be used on System 7.0 machines.

Note: The InBox INIT must reside at the root level of the System Folder. You can double-click on it to access the Control Panel settings. If you wish to access it from the Control Panels Folder itself, you can make an Alias for it, and drag the Alias to the Control Panels Folder.

Upgrading an InBox Mail Server Message Center from System 6 to System 7.0

\* No special procedures are required. The InBox Server INIT will be moved to the Control Panels Folder.

Upgrading an InBox File Server Message Center from System 6 to System 7.0

\* No special procedures are required.

Installing an InBox Client on a Macintosh under System 7.0

\* No special procedures are required. If you wish to access InBox from the Apple Menu, make sure you install InBox into the System Folder. Then drag the InBox application into the Apple Menu Items Folder. Do not install the InBox DA into the Apple Menu Items Folder. The InBox DA should not be used on System 7.0 machines.

Note: The InBox INIT must reside at the root level of the System Folder. It can be double-clicked on to access the Control Panel settings. If you wish to access it from the Control Panels Folder itself, you can make an Alias for it, and drag the Alias to the Control Panels Folder.

Installing an InBox Mail Server Message Center on a Macintosh under System 7.0

\* After using the InBox Administrator to create a Mail Server Message Center on a machine running System 7.0, you must drag the InBox Server INIT from the root of the System Folder to the Control Panels Folder, in order to access the Server INIT from the Control Panel.

Installing an InBox File Server Message Center on a Macintosh under System 7.0

\* Copy the InBox Administrator to the hard drive of the Message Center Macintosh launch it from there. Do not launch the Administrator from a floppy disk when creating a File Server Message Center under System 7.0.

Note: To Create a File Server Message Center over the network under System 7.0 (those wishing to create a File Server Message Center on an AppleShare Server might wish to do this), launch the InBox Administrator from an AppleShare Client Macintosh. When you attempt to open the remote volume in the Administrator, you will get the following message: "That name is already used by a folder." Click OK. The remote volume will still be selected in the list box. Click once inside the text box, enter the name of the Message Center, and click the SAVE button.

The System 7.0 Compatibility Checker: If you run the System 7.0 Compatibility Checker on an InBox Client, the InBox INIT will be placed in a folder called "May Not Work with System 7.0". If you run the System 7.0 Compatibility Checker on an InBox Mail Server Message Center, the InBox Server INIT will be placed in this folder as well.

## System 7: Novell's Notify Extension is Incompatible (10/93)

Revised: 10/22/93  
Security: Everyone

System 7: Novell's Notify Extension is Incompatible (10/93)

Article Created: 2 July 1991  
Article Reviewed/Updated: 22 October 1993

TOPIC -----

The Notify extension from Novell is incompatible with System 7.x.

DISCUSSION -----

The Notify extension version 2.1 from Novell causes severe performance degradation on Macintosh systems running System 7.x. These performance problems extend beyond network performance slowdowns and include actions as simple as opening your hard drive. You should use the latest release of the Notify INIT which is version 3.0.

Below is an excerpt from the Read Me regarding the release:

"NOTIFY v 3.0

This version of the Notify INIT addresses several issues. It includes the fix for a problem with Notify loading on a System 6.x Macintosh with over 8 MB of RAM. It resolves several performance issues when running System 7. And the frequency at which it polls the Netware server for messages has been decreased, which resolves some performance problems on large networks."

Article Change History:

## StyleWriter: Screen Dimmers May Cause Lost Characters

Revised: 9/12/91  
Security: Everyone

StyleWriter: Screen Dimmers May Cause Lost Characters

=====

Article Created: 5 July 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

The StyleWriter printed output occasionally is missing characters. How do I fix this?

DISCUSSION -----

Start up from a floppy and print some directories. Also use TeachText to print out the Read Me files on the startup disk. If these files print with no problem, check for screen savers or timeout INITs

Screen dimmers that timeout when the machine is processing a job for the StyleWriter can interfere with the print job transmission and processing to create these intermittent lost characters.

## System 7: Features and Benefits

Revised: 8/18/92  
Security: Everyone

System 7: Features and Benefits

Article Created: 5 July 1991

### Article Change History

08/18/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

This article describes the features and benefits of System 7, and the upgrade offers available.

### DISCUSSION -----

System 7 works on all Macintosh computers from the Macintosh Plus on. System 7 is compatible with most of the more than 4,000 Macintosh applications currently shipping, and has inspired many new products.

### Benefits

Customers who upgrade to System 7 will receive the immediate benefits of new features such as TrueType™ font technology, Virtual Memory, File Sharing, System 7 Finder®, Multitasking, Balloon Help™ and 32-Bit Addressing.

### TrueType

System 7 offers all Macintosh users high-quality text at any size on any Macintosh screen and on the printed page with TrueType, Apple's outline font technology. TrueType is compatible with most existing applications and bitmap fonts and provides users with smooth type quality on the screen and on any output device such as PostScript® and non-PostScript printers, imagesetters, and film recorders.

## Finder and Balloon Help

-----

The System 7 Finder, also known as the user's desktop, has been simplified so that customers can quickly locate and use their information. All aspects of the Finder--including fonts, desk accessories, control panels and even the System--can be opened by double-clicking on them. In addition, the new System 7 Finder facilitates system management and set-up: files, folders, and applications can now be added to the Apple Menu; users can have outline views of all files and folders; and fonts, system extensions, and control panels, can easily be installed by dragging them to the System Folder.

System 7 also provides Macintosh users with an interactive System-wide Help system. Apple's Balloon Help is non-modal, allowing users to get help while continuing to work. When customers turn on Balloon Help and point to any object on the screen, a balloon appears that describes the object they are pointing to and how to use it. Macintosh software application developers are also incorporating Balloon Help into new releases of their programs. This feature will enable users to learn applications more quickly by providing an easily accessible reference to more features.

## Finder and File Sharing

-----

The new Find capability offers users fast and easy access to their files. The user can select Find, then type a word or phrase, and the system searches the disk for files whose names include the word or phrase. Find also offers more advanced options so users can perform more detailed searches. For example, users can find all files that they worked on today or files that were labeled with a specific color.

File sharing allows any user to share designated items (files, folders, and even whole volumes of information) with any other user over the network, without a dedicated file server. File sharing follows Apple File Protocol (AFP) standards, which means that any System 7 user can share files with any Macintosh System 6 user, and--by using third-party products-- with DOS and Windows users. File Sharing includes a complete security model that lets users provide levels of access and password protection.

Aliases allow all Macintosh users to organize their systems the way they prefer and makes it easier to access information. An alias, usually about 2K in size, of a file, folder, application, or volume (even a file server), acts as a pointer to the original object. With aliases, users can have access to documents, folders, and applications from more than one location. For example, a user may work with a particular word processor each day and would like to have it on the desktop but also organized within an applications folder. With aliases, users can do both without taking up much additional space on the hard disk.

Aliases and file sharing work in combination to provide more capabilities. For example, Macintosh users can carry an "office on a disk" by making an alias of their hard disk, placing it on a floppy disk, and when the user

goes to any system on a network (across the hall, downstairs, or anywhere else) the user has access to the hard disk by double-clicking on the alias and typing a password.

#### Memory and Multitasking: Virtual Memory and 32-Bit Addressing

-----

Multitasking is a standard part of Macintosh System 7, allowing users to work on several tasks concurrently. For example, a user can recalculate a spreadsheet, print a file, sort a database, and upload a file to a network while continuing to work on a word processor document. System 7's Virtual Memory expands the Macintosh's memory through software so that Macintosh users can run more and larger applications. Virtual Memory uses the hard disk as an extension to RAM, providing users with more memory when it's needed. In addition, 32-bit addressing allows users to install and access more than 8MB of RAM. The additional memory users can access will provide additional power for large applications and tasks such as animation, computer-aided design, and scientific visualization.

#### Publish and Subscribe

-----

In 1984, the Apple Macintosh introduced the concept of "copy and paste," allowing users to share graphics and text among different files within different applications. With System 7, Apple has taken "copy and paste" one step further with dynamic document links known as "publish and subscribe." Publish and Subscribe enables users to link any two documents--regardless of the application--to automatically update the information. This capability of System 7 even works over a network.

#### Apple Events

-----

Apple events is the underlying messaging language that applications use for communication with other applications. It provides the foundation for applications to seamlessly work together sharing information and features on the same machine or over a network. Through new applications that support Apple events, users will be able to use features of a variety of applications while working in one application. For example, an accounting package can pass inventory data to a spreadsheet, instruct the spreadsheet to graph the data, and retrieve the graph for display in its own report.

#### Data Access Manager

-----

The Data Access Manager, which ships as a standard component of System 7, provides Macintosh applications with the underlying technology that enables data access from remote host computers, regardless of the host computer, the connecting networks, or the database software.

#### Upgrade Path

-----

System 7 offers all existing Macintosh users an upgrade path. Apple's design goals required that System 7 run on all Macintosh computers from the Macintosh Plus, Portable, and Classic on up to the latest, most powerful models. In addition, Apple has developed a suite of tools for customers that make the transition to System 7 as easy as possible.

## Before You Install

-----

Apple developed a HyperCard® stack called Before You Install, to give users a better understanding of System 7 and system compatibility. Before You Install features two sections of information: What's New in System 7, and Compatibility Checker. What's New in System 7 helps customers find out more about System 7 and explore some of the new features before upgrading. The Compatibility Checker provides customers with an automated tool for checking application, desk accessory, and control panel compatibility before moving to System 7. The Compatibility Checker, available in the United States, includes information on over 650 products. A printed Compatibility Guide is also available.

## Network Install

-----

As part of the System 7 Group Upgrade Kit, Apple includes a network-install version of the software. Users will be able to upgrade multiple systems over a network with the Macintosh one-button install. This process will alleviate the network administrator's task of manually upgrading many systems in sequence.

## Upgrade Kits

-----

System 7 works with all Macintosh computers--from the Macintosh Plus, Portable, and Classic on up--with 2MB of RAM (though 4MB is recommended) and a hard disk. System 7 is available to users in two versions: the System 7 Personal Upgrade Kit, and the System 7 Group Upgrade Kit.

The Personal Upgrade Kit includes ten floppy disks containing System 7 software, the Before You Install stack, and HyperCard version 2.1. The kit contains 90 days of upgrade phone support, new user manuals, and the System 7 Compatibility Guide.

The Group Upgrade Kit includes everything that is in the Personal Upgrade Kit, plus a System 7 CD-ROM, 180 days of upgrade phone support, site license, and Group Upgrade Guide. The System 7 CD-ROM includes a System 7 configuration that can be installed over a network, an array of utilities, and on-line documentation. The Group Upgrade Guide offers network administrators a resource for upgrading small and large groups of users in varied network environments.

## Trademarks

## System 7: Creating Groups for File Sharing

Revised: 9/10/92  
Security: Everyone

System 7: Creating Groups for File Sharing

=====

Article Created: 18 July 1991

### Article Change History

-----

09/10/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

How do I create Groups for file sharing?

### DISCUSSION -----

Whenever more than one user needs access to a particular folder on your system, you can create a group. The group contains the names of all the users who belong to it. Each user can be a member of as many groups as desired. Once the group is created, access permission can be controlled at the group level.

After creating all the individual users, create a group to which they all belong. Here's how to create a group:

- 1) Open the Users & Groups control panel.
- 2) Choose New Group from the File menu. A new double-headed icon appears, ready to have a name typed in to replace the default name "New Group". Type in whatever you want to name the group.
- 3) To include each user you want in the new group, drag the user's icon onto the group icon. Note that even though the user is added to the group, the user's icon stays in the Users & Groups window as well.
- 4) Open the group icon to see who is in the group. To remove a user from

a group, drag the user's icon out of the group and throw it away.

- 5) When you open the user icon after a user has been added to a group, the names of the groups to which that user belongs appear in the user's Groups box.

Remember that anyone who walks up to your system can change file sharing passwords and permissions. You may want to consider getting a System 7 compatible password locking screen saver.

## System 7: What is Disk Cache? (4/96)

Revised: 4/26/96  
Security: Everyone

System 7: What is Disk Cache? (4/96)

=====  
Article Created: 18 July 1991  
Article Reviewed/Updated: 26 April 1996

TOPIC -----

What is disk cache?

DISCUSSION -----

Disk cache is a static area in RAM set aside to help the Macintosh work more quickly and efficiently.

When a program asks for data from the disk (such as a part of a document), many times the next piece of data the program will need (such as the next part of the document) can be anticipated. Therefore, instead of transferring from disk to memory only the amount of data you are immediately working with, the system puts a larger amount (the size-of-disk-cache) of data into memory. This way, instead of spending the time to search for data on the disk again, the next piece of information will already be available. Disk cache works better on non-fragmented disks.

It may seem that the size-of-disk-cache should be configured to be quite large so that the need to search on the disk is greatly reduced. But this is not so because the memory allocated to disk cache cannot be used for opening more applications or documents. Thus, giving disk cache a huge amount of memory only makes that unavailable for use as RAM; it will not result in an increase in performance.

If the total memory of your system software appears to be very large under "About this Macintosh..." you should consider decreasing the memory allotted to disk cache. Open the Memory control panel, and click the down arrow in the Disk Cache box.

## System 7: Notes on File Sharing

Revised: 9/10/92  
Security: Everyone

System 7: Notes on File Sharing

=====

Article Created: 18 July 1991

### Article Change History

-----

09/10/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

Here is some information you need to know when you use the Sharing option from the File menu to share a folder.

### DISCUSSION -----

Even after you have configured your Sharing Setup control panel, no one, not even the Guest account, can gain access to your system until you have configured folders or disks to be shared. File sharing won't happen until you give access to something to be shared--either folder or disk.

The appearance of a shared folder changes. When a folder has been configured to be shared, there will be network cables pictured at the bottom of the folder. When another user is using the folder, faces appear on the folder.

Once a folder has been shared, no folder above it in the disk hierarchy, or the disk itself, can be shared. If you try to do this, a dialog box will tell you the item could not be shared.

For example, if you share a folder on a hard disk, and then try to share the hard disk, the system will complain. You must turn off sharing on the folder before the system will allow you to mark the entire disk for sharing.

However, the opposite is not true. If folder A contains folder B, and folder A is shared, you may still share folder B. This enables you to set different permissions on folder B from those on folder A.

## System 7: Permission Decisions for File Sharing

Revised: 9/10/92  
Security: Everyone

System 7: Permission Decisions for File Sharing

=====

Article Created: 18 July 1991

### Article Change History

-----

09/10/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

Once you have configured disks or folders for file sharing, you need to make decisions on file access permissions.

### DISCUSSION -----

First decide who is allowed to share on your system.

The center section of the Sharing dialog box determines the permissions of the files and folders within the folder or disk you are sharing.

There are three categories of users to define and specify permissions for:

- Owner is defined, by default, as the owner of the system as configured in the Sharing Setup control panel. The Owner name is a pop-up menu containing all of the users you have defined on your system. Defining someone else as the owner of a shared item will allow them to change all permissions pertaining to that folder or disk. You should change the owner of a folder or disk with care.
- The User/Group box allows either a user or a group to have the specified permissions set in the three check boxes.
- The Everyone category covers those users who are not defined in the Owner or User/Group category. This includes the user named Guest.

By default, the Guest may log on to any system on the network without a password.

Therefore, for maximum security, always set the Everyone permission settings to off.

If the item you are sharing is a folder inside an already shared folder, you will have a "Same as enclosing folder" check box. Clicking this check box copies the same privileges of the enclosing folder to the currently selected folder.

Once permissions are set, you can click "Make all enclosed folders like this one" to make the same privileges to all folders beneath the folder on which you are setting permissions.

Second, decide what those users and groups can share.

For each of the three categories -- Owner, User/Group, and Everyone -- you must decide what permissions you wish to grant.

- The permission See Folders indicates that users will have the icons of folders visible when they log on to your system. If this box is not checked, the corresponding user will not see any folders inside the shared item.
- The permission See Files is the same as See Folders, but pertains to files. Without this box checked the corresponding user category will not see any files. Users who can see a file can also copy it.
- When checked, the permission Make Changes allows the corresponding user to alter or throw away files and folders. Otherwise, the user will be able to open the file for viewing but not save any changes.

Once you have checked the permission boxes to reflect how you want your system configured, close the box in order for the changes to take place. Dialog boxes will appear, confirming your changes. Click OK to save your changes, or Cancel to disregard them.

Important: If you do not change any permissions when you select an item for sharing, the default configuration is to have the folder or disk open for view, change, and removal by anyone on your network.

=====

Article Created: 26 July 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

When using TrueType, is there a limit to how large text size may be?

DISCUSSION -----

One of the benefits of TrueType is that characters can now be generated at any point size up to 32,000 points. However, almost all applications currently limit text size to 127 points. Also, some limit the number of size selections possible. Some applications do their own scaling for sizes above 60 points.

## System 7: Program Linking and InterApplication Communication

Revised: 4/12/93  
Security: Everyone

System 7: Program Linking and InterApplication Communication

=====

Article Created: 26 July 1991

### Article Change History

-----

08/18/92 - REVISED

- To include text of another article detailing steps of setting up program linking.

### TOPIC -----

When do I need to turn on Program Linking? Is Program Linking necessary to send AppleEvents between programs?

### DISCUSSION -----

With AppleEvents, there are two possible configurations to take into account. The two communicating applications can be on the same computer, or they can be on different computers.

If the two applications are on the same computer, they simply use AppleEvents to communicate, with no other setup needed.

However, if the two programs are on different computers, permissions must be put in place to regulate the other system's ability to communicate with the programs on your system. When others are actively linking to your programs, your system may be slower to respond than usual.

You must turn on Program Linking to enable the InterApplication Communications (IAC) features of applications that are System 7-compatible. Program Linking is the switch that lets applications communicate with each other by sharing commands and data over AppleTalk networks. It provides security measures that prevent unauthorized use of programs and data from remote computers. To activate IAC, permission must be granted at System and Application levels.

### How to Turn On Program Linking

-----

To respond to events from remote computers, you must explicitly let network users link to your computer. To do this, follow these steps:

- 1) Open the Control Panel folder.
- 2) Open the Sharing Setup Control Panel.
- 3) Enter your name, password, and your computer's name.
- 4) Click the Start button for Program Linking.

The Sharing Setup Control Panel then states "Program Linking is on. Click Stop to prevent other users from accessing shared programs." To prevent other computers from initiating sessions, click Stop underneath Program Linking.

### Selecting Specific Applications

-----

Here's how to select specific applications:

- 1) Select an application from the Finder.
- 2) Choose Sharing from the File menu.
- 3) Click the Allow Remote Program Linking checkbox.

### What Else You Must Do

-----

In addition to letting remote users initiate conversations between applications via Program Linking, you must:

- Permit physical access to their programs and data by enabling File sharing from the Sharing Setup Control Panel
- Choose which other users to interact with via the Users and Groups Control Panel.

To establish access for other users and guests, follow these steps:

- 1) Open the Users & Groups icon in the Control Panels folder.
- 2) To specify a particular new user, choose New User from the File menu.
- 3) Type the user's name and password.

## System 7: Program Linking versus Publish and Subscribe

Revised: 9/22/92  
Security: Everyone

System 7: Program Linking versus Publish and Subscribe

=====

Article Created: 26 July 1991

### Article Change History

-----

09/22/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

How does publish and subscribe differ from program linking?

### DISCUSSION -----

Publish-and-subscribe uses a transition file called the edition file. In program linking, the two programs talk directly to each other.

You probably would publish a report generated from a database, but not the cells of the database. For example, a word processor gets the top ten salespeople from a database.

Publish and subscribe, by which a change in one document effects a change in another document, has some of the flavor of program linking. However, it is important to note the differences, and corresponding strengths, of each feature.

The publish and subscribe feature is good for allowing programs (and their documents) to share data, while program linking using AppleEvents allows programs to communicate with each other--not only to send and receive data, but also to provide services to and request services from the other program.

Publish and subscribe are used when:

-----

- you would otherwise copy and paste the same data;

- the data involved will probably not be changed by the users who subscribe to it;
- the data is likely to be widely distributed--as in a large writing project;
- one document needs data from several other documents.

Applications use AppleEvents to:

- 
- get data from another program if the details of the request change slightly each time;
  - get another program to manipulate and return a set of data;
  - configure and control a variety of programs.

## System 7: Program Linking versus File Sharing

Revised: 9/10/92  
Security: Everyone

System 7: Program Linking versus File Sharing

=====

Article Created: 26 July 1991

### Article Change History

-----

09/10/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

How is program linking different from file sharing?

### DISCUSSION -----

File sharing and program linking both provide the ability to manipulate files, but program linking is a more comprehensive approach to the task.

File sharing strengths are based on the accessibility of files to others on your network. File sharing can make folders, hard disks, and CD-ROMs available to others. Users manipulate the files as if the files were local to their systems.

Program linking, on the other hand, is an automated programming effort in which applications are working with and manipulating other applications.

In configuring program linking, one element is similar to file sharing. To make a program available for linking, you choose Sharing from the File menu. There is never a conflict between the two because you may share only disks or folders, and you may link only application programs.

## NetWare for Macintosh 3.0

Revised: 9/12/91  
Security: Everyone

NetWare for Macintosh 3.0

=====

Article Created: 10 July 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

On February 11, 1991, at NetWorld in Boston, Novell, Inc. announced NetWare for Macintosh 3.0, a complete AppleTalk protocol-suite implementation that fully integrates Macintosh desktop systems into the NetWare v.3.11 network computing environments (formerly named NetWare 386 v.3.x).

Apple does not endorse or recommend any third-party products mentioned in this article, which was first published in AppleGram, May 1991.

DISCUSSION -----

NetWare for Macintosh 3.0

-----

NetWare for Macintosh 3.0 provides file and print services to Macintosh clients in a NetWare environment using the AFP and PAP, AppleTalk protocols. This means Macintosh users connect to a NetWare v.3.11 server in the same way as they connect to any other AppleShare® file server--by logging in and selecting volumes through the Chooser. Printing to a PostScript printer connected to the Novell server is also done in the familiar Macintosh way.

NetWare for Macintosh 3.0 provides Network Administrators easy and complete solutions for integrating Macintosh systems into NetWare v.3.11 environments. The implementation of the full AppleTalk® stack as a set of NetWare Loadable Modules (NLMs) provides the architecture necessary for integrating Macintosh with other Novell services, such as NetWare Communications.

Macintosh Integrates Into Multivendor Networking Environments

-----

NetWare for Macintosh 3.0 is an important milestone for Macintosh users in multivendor networking environments. Macintosh users can now share resources with DOS, Windows, OS/2 and UNIX® desktops when in an advanced networking environment. NetWare for Macintosh 3.0 also offers enhanced security, fault tolerance, and high performance to all client desktops. Macintosh users in this large network environment will find accessing these remote network resources as easy as accessing their local file servers and printers.

#### Macintosh Administration Capabilities

-----

Additional features of NetWare for Macintosh 3.0 include:

- Macintosh client software that allows any Macintosh user on the network to control NetWare capabilities such as setting rights, assigning trustees, managing print queues and sending messages to other networked users
- Macintosh client software that allows designated Macintosh users to perform administrative tasks such as adding or deleting users and groups, assigning passwords, and setting file attributes
- Support for AppleTalk Phase 1 and Phase 2

#### AppleTalk Routing

-----

NetWare for Macintosh v.3.0 includes an AppleTalk Router as one of its core technologies. That means that users can share AppleTalk resources on different AppleTalk networks that are connected by the server.

#### NetWare for Macintosh 3.0

-----

AppleShare products are the ideal solutions in environments that are primarily Macintosh and where the network services required are primarily file and printer sharing. NetWare for Macintosh uses the same AppleTalk protocols and user interface model as Apple's AppleShare products. Using Apple's model, Novell is able to integrate many of the advantages of AppleShare into a more advanced networking environment where multivendor connectivity, enhanced security, fault tolerance, and high performance are critical user requirements.

## System 7: Running the Compatibility Checker

Revised: 9/3/92  
Security: Everyone

System 7: Running the Compatibility Checker

=====

Article Created: 15 July 1991

### Article Change History

-----

09/02/92 - REVISED

- To add information about flagging new software as incompatible and version 1.1.

### TOPIC -----

How do I run the System 7 Compatibility Checker and how does it work?

### DISCUSSION -----

The Compatibility Checker is a HyperCard stack that checks the programs on your system against a database of applications contained within the stack. It then reports the compatibility status as provided by developers. Note that if your software is brand new, the Compatibility Checker may flag it as incompatible simply because it doesn't recognize the new version number. Also, check that you have version 1.1 of Compatibility Checker, which adds much new software to the list and updates existing information.

Here's how to use it:

- 1) Open the Before You Install stack.
- 2) Click Compatibility Checker.
- 3) Click the Set Up button.
- 4) Select the disk(s) to check.
- 5) Click the Start Checking button.

The stack starts checking: first for viruses, then for applications, INITs, cdevs, rdevs, and DAs. Depending on the number of items, this may take a while. The stack displays progress on a bar chart.

- 6) Once the check is complete, you are given a choice of moving any potentially incompatible items out of your System Folder. Click the Move Items button if you want the Compatibility Checker to move the items for you. Click the Don't Move Items button if you prefer to move them yourself.
- 7) The program provides a report, which lists all of the items checked and their compatibility status.
- 8) Click the Print Report button to print the report, or the Save Report button to save the report to disk.
- 9) Click the Quit button to exit the stack.

## System 7: Activating Finder Windows

Revised: 9/11/92  
Security: Everyone

System 7: Activating Finder Windows

=====

Article Created: 15 July 1991

### Article Change History

-----

09/11/92 - UPDATED

- To give additional tips.

### TOPIC -----

I've noticed that directory windows sometimes become active when I release the mouse. Is this a new feature of System 7?

### DISCUSSION -----

Yes. This is an enhanced feature of System 7. It prevents active windows from getting in your way while you are moving icons.

To make a window active, simply click the window. If you click an icon, the window activates when you release the mouse button. If you click elsewhere in the window (not an icon), the window activates when you press the mouse button.

This is different from System 6, in which windows are always activated on mouse-down.

This allows you to move an icon from an inactive window to another window without having the inactive window become active and possibly cover other items on your desktop.

Moving an icon from an inactive window to another inactive window leaves the currently-active window active. This way you can move an icon from an inactive window to an inactive window without making either active. Also, if you want to move a window without making it active, hold down the

# ..TIL08368-System\_7-Activating\_Finder\_Windows\_(TA46813).pdf

Command key and drag the window (by clicking in the title bar).

## System 7: Findable Attributes

Revised: 9/11/92  
Security: Everyone

System 7: Findable Attributes

=====

Article Created: 15 July 1991

### Article Change History

-----

09/11/92 - REVISED

- To add additional information.

### TOPIC -----

Can I use the Finder's Find command to search for files by attributes?

### DISCUSSION -----

Yes. The Find command seeks out the file you want to locate and selects it based on a variety of file attributes, allowing you to refine your searches to be as specific as you want. For example, you can find all the files created between May 21 and July 27 that are larger than 15K.

You can search for files by:

- Name
- Size
- Kind
- Label
- Date Created
- Date Modified
- Version
- Comments
- Lock

You can find files using any or all of the criteria above, singly or in combination. (Warning: rebuilding the desktop removes all comments on a drive.) If you want to search using multiple attributes, just do your first search, checking the "all at once" box. Then, with all the selected files

still highlighted, do another search for your secondary attribute. You may do this until you narrow the search down to the desired level.

The Search pop-up menu near the center of the dialog box lets you search on any currently mounted disk or server.

The choices available in a pop-up menu depend on the contents of the pop-up menu(s) to its left.

## System 7: Customized Installation

Revised: 9/21/92  
Security: Everyone

System 7: Customized Installation

=====

Article Created: 10 September 1991

### Article Change History

-----

09/14/92 - REVISED

- For technical accuracy.

### TOPIC -----

How do I do a customized installation of System 7?

### DISCUSSION -----

You may want to custom install:

- To limit the installation of certain features (for example, File Sharing)
- To minimize the amount of disk space the system occupies

The following instructions are for an installation from floppy disk.  
(Installation from CD-ROM is similar, except that you don't have to swap disks.)

- 1) Restart your Macintosh with the Install 1 disk in the floppy drive.
- 2) Open the Installer application on the Install 1 disk.
- 3) Click OK to proceed past the welcome box.
- 4) Verify that the disk named on the Installer screen is the drive on which you want the software to be installed. Click Switch Disk if you want to install on a different drive.

- 5) Click the Customize button.

The custom installation screen appears, showing the parts of the system software and a choice of standard or minimal system files for each model of Macintosh.

- 6) Scroll through the list of items and Shift-click the ones you want to install. As you select items, their names appear in the lower-left portion of the dialog box.
- 7) Click Install to install this software configuration onto the selected disk.

The Installer will decide which disks are required, and then prompt you to insert them as needed.

- 8) Click Quit when you see a message indicating that the installation was successful.
- 9) Click Restart in the dialog box that appears when you quit the Installer.

Note: When installing on an external hard drive that might be used on another system, it's best to choose the "For any Macintosh" option.

Security: Everyone

System 7: Keyboard Navigation

=====

Article Created: 15 July 1991

### Article Change History

-----

08/24/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

System 7 provides shortcuts to navigate around your files. This article tells how to use these techniques.

### DISCUSSION -----

Here's where you can use navigation shortcuts:

- In Finder windows
- In the Chooser
- In the list displayed in a directory dialog box
- On the desktop

Typing any alphabetic character moves the selection to the first item whose name begins with that character, or the next closest successive character in the alphabet.

For example, if you type the character "s", your selected icon may be the System Folder, if no other files or folders come before the word System in alphabetical order.

The speed at which you type in the characters is important. If there are

several files beginning with the character "s", you can type more of the name to select the desired icon. If you type too slowly, though, the system will think you want an icon beginning with a letter other than "s".

Pressing the Tab key moves the selection to the next icon in alphabetical order. Pressing Shift-Tab moves the selection to the previous icon in alphabetical order.

Finally, the arrow keys select the next icon in the direction of the arrow.

## System 7: Pop-up Title Bars

Revised: 9/11/92  
Security: Everyone

System 7: Pop-up Title Bars

=====

Article Created: 16 July 1991

### Article Change History

-----

09/11/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

In the Finder, pop-up menus provide another shortcut for quickly moving around your desktop.

### DISCUSSION -----

To access the pop-up menu of the active window, simultaneously:  
- hold down the Command key,  
- put the pointer over the name at the top of the window, and  
- press the mouse button.

The pop-up menu not only shows you the path of the active window, but if you choose a folder from the pop-up menu, the system makes that window active. If the window is not already open, it opens and is made active.

To simultaneously choose a new window to open and to close the currently active window, hold down the Option key as well as the Command key.

## System 7: How to Use Control Panels

Revised: 9/13/91  
Security: Everyone

System 7: How to Use Control Panels

=====

Article Created: 10 September 1991

### Article Change History

-----

08/25/92 - REVIEWED

- For technical accuracy; edited.

### TOPIC -----

This article explains how to use control panels in System 7 to customize your system.

### DISCUSSION -----

In System 7, control panels open as though they were applications. Just double-click their icons, and you have access to the control panel you want.

An alias for the Control Panels folder is in the Apple Menu Items folder, making the control panels even easier to use. The alias in the Apple menu also provides interface compatibility for System 6.0.x users. You can have more than one Control Panel open at the same time.

To install a new control panel, simply drag its icon onto the System Folder icon. It will automatically be put into the Control Panels folder. (You can move control panels directly to the Control Panels folder yourself, of course.) Control panels can be put anywhere for quick access: on the desktop, in a folder, in the Apple menu, and so on. But if a control panel has INIT code that needs to be loaded at startup, it must be in the System Folder or the Control Panels folder.

Some functions that once were adjustable only with ResEdit™ can now be modified by control panels. The settings you can adjust in the control

panels include, but are not limited to:

- Font and type size used by the Finder for icon names
- Icon size and attributes listed in list views
- Icon layout in icon views
- Memory control
- Pattern and colors of the desktop
- Date, time, and display of time
- Speaker volume and alert sound
- Relative distance the pointer moves on screen when you move the mouse
- Relative positions of multiple monitors
- Number of colors or shades of gray displayed
- Disk drive to be used for startup (startup volume)
- Label names and colors available for icons
- Special aids for using the keyboard and mouse
- File sharing setup and program-to-program connections  
(available to Macintosh computers on a network)
- Remote user access

## System 7: Installing Fonts and Sounds

Revised: 9/13/91  
Security: Everyone

System 7: Installing Fonts and Sounds

Article Created: 17 July 1991

### Article Change History

-----  
08/25/92 - REVISED  
• To make more clear. Added topic.

### TOPIC -----

What is the correct way to install fonts and sounds in System 7?

### DISCUSSION -----

In System 7, there are two ways to install a font or sound:

1. Drag the resource icon onto the System Folder icon.
2. Drag the resource icon into the open System file (in System 7, the System file can be opened as if it were a folder).

To have the system software automatically install the font or sound in the correct location:

- 1) Quit all programs that are currently open.
- 2) Select the icon of the font or sound you want to install.
- 3) Drag the selected icon onto the System Folder icon of your startup disk. A dialog box appears asking if the item should be installed in the System file.
- 4) Click OK to complete the installation.

To install the font or sound yourself:

- 1) Quit all programs that are currently open.
- 2) Open the System file. Opening the System file may take some time, if the file is large.
- 3) Select the icon of the font or sound you want to install.
- 4) Drag the selected icon into the System file window.
- 5) Close the System file.

You get a warning if you try to install a resource when any applications (other than the Finder) are open. If you don't get a dialog box after dragging a sound to the System Folder icon, the sound is probably the wrong resource type. Open the System Folder and see if the sound was left sitting inside that folder instead of being installed in the System file itself.

## System 7: Removing Fonts and Sounds

Revised: 9/10/91  
Security: Everyone

System 7: Removing Fonts and Sounds

=====

Article Created: 17 July 1991

### Article Change History

-----

08/25/92 - REVIEWED

- For technical accuracy; edited.

### TOPIC -----

A new feature of System 7 allows you to remove fonts and sounds by dragging the resource icon out of the open System file. This article details how to do this.

### DISCUSSION -----

Fonts and sounds are removed by dragging them out of the System file.

- 1) Quit all programs that are currently open. You'll get an error message if you try to remove a font or sound when any programs (other than the Finder) are open.
- 2) Open the System file. This may take a few moments if the file is large.
- 3) Select the icon of the font or sound you want to remove.
- 4) Drag the icon out of the System file window. To discard the font or sound, drag it into the trash. To save it for future use, drag it anywhere outside of the System file.

## System 7: System Sounds

Revised: 9/10/91  
Security: Everyone

System 7: System Sounds

=====

Article Created: 17 July 1991

### Article Change History

-----

08/25/92 - REVISED

- To provide more detail; rewrote topic.

### TOPIC -----

How do I recognize a sound file? How do I play a sound when it is installed in the System Folder?

### DISCUSSION -----

Sounds are identified by their unique icons. Under System 7, you can play a sound by double-clicking the sound file, whether it is inside the System file or loose on the disk.

Sounds installed in the System file must be sound resources, in particular, resources with the type "snd". (You can check the resource type by using ResEdit.) If you are able to drag a sound file into the System file, then it is in the proper format. There are several third-party sources for sound resource conversion applications.

To change the system alert sound:

- 1) Open the Sound control panel. This is usually located in the Control Panels folder within the System Folder, or accessed via the Control Panels menu item in the Apple menu.
- 2) Click the name of the sound you want. The sound is played.
- 3) Adjust the volume, if desired. The alert sound is played to

demonstrate what it sounds like at the new volume.

## System 7: Changes to the System File

Revised: 9/13/91  
Security: Everyone

System 7: Changes to the System File

=====

Article Created: 17 July 1991

### Article Change History

-----

08/25/92 - RETITLED  
• For clarity.

### TOPIC -----

In System 6.0.x, you had to use the Font/DA Mover to open the System file. In System 7, the System file behaves as an ordinary folder that can be opened from the Finder.

### DISCUSSION -----

To open the System file, double-click it. When open, the System file displays all of the fonts, keyboard layouts, and sounds installed in it -- as though it were a folder. While fonts and sounds are actually resources, they are treated as though they were simply files within a folder. (Because resources are special files, aliases cannot be substituted for them.)

You can double-click any font to see a sample of that font. You can double-click any sound to hear the sound.

Many of the functions that used to be contained in the System file have been moved to specific control panels. Modifying such things as icon layout no longer requires manipulation of the System file with ResEdit or other tools.

## System 7: Edition Files

Revised: 9/22/92  
Security: Everyone

System 7: Edition Files

Article Created: 17 July 1991

### Article Change History

-----  
09/22/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

This article discusses operations performed with edition files.

### DISCUSSION -----

You, the user, make the choice of when a publisher will update its edition file. Generally, the two choices are to update the edition either:

- automatically when the file containing the publisher is saved, or
- manually when the Send Edition Now button is pressed from the Publisher Options dialog.

Different applications may have different options. Links between publishers and their edition files are effective until they are specifically canceled. If an edition file is thrown away without canceling the link, a new edition file will be created when the document containing the publisher is saved.

You cannot directly change the edition files, though you can open them to examine their contents. When you open an edition, the contents of the file are displayed and you get a dialog box asking if you want to open the publisher, presumably to make changes.

You also make the choice of when a subscriber will receive edition updates. Again, there are generally two options; a subscriber may update:

- automatically when the file containing the subscriber is opened, or
- manually when the Get Edition Now button is pressed from the Subscriber Options dialog.

If you cancel a subscriber, the current information will remain, but it will no longer be updated. If a subscriber's linked edition file has been removed, a warning dialog is issued.

The System software keeps track of which edition files are linked to which publishers and subscribers, in the same way it keeps track of alias files. If an edition file is moved, the system updates its pathname. Making a copy of an edition file does not copy its linkages, however.

Publishing is different from program linking. Publishers update an intermediate file, and subscribers update from that intermediate file. In program linking, an application sends commands (AppleEvents) directly to another application; there is no intermediary.

## System 7: Using Stationery

Revised: 9/10/91  
Security: Everyone

System 7: Using Stationery

=====

Article Created: 17 July 1991

### Article Change History

-----

08/18/92 - REVISED

- Combined two articles into this one.

### TOPIC -----

What is stationery? How can I use it? Does it work with all applications?

### DISCUSSION -----

Stationery is a System 7 feature with which you create "template" documents. For example, if you have a memo form that you use frequently, you can create a stationery document that gives you a fresh version of the memo every time you open it.

Stationery works with all applications. Some applications are stationery-aware. That is, you can specify whether a document should be treated as stationery when you first save the document using the "Save As..." command. Although other applications are not stationery-aware, there is another way to create a stationery document.

### How to Create a Stationery Document

-----

Follow these steps:

- 1) Create your template document in your application. For example, you might have a document that has "From:" "To:" and "About:" lines.
- 2) Save the document to your disk.

- 3) Switch back to the Finder (desktop).
- 4) Select the document's icon.
- 5) Choose Get Info from the File Menu.
- 6) Click the box marked "Stationery" in the Get Info window.
- 7) Close the Get Info window.

When you open the stationery document, you get a copy of the document for your use.

A stationery pad can be opened like any other document -- by double-clicking its icon, by selecting it and then opening it from the File menu, or by opening it from within an application.

When a stationery pad is opened for an application that supports this feature, a new file with the title "Untitled" is created. This file is a copy of the stationery pad, containing all the formats and information of the original. You make changes to the "Untitled" document, naming it when you save the new document. The new document is saved as a regular document -- not as a stationery pad -- unless you specify otherwise.

For applications not yet supporting the stationery option, you name the new document when you open the stationery pad. Double-click the icon of the stationery pad you want to open. A dialog box appears asking you to name the document. Type a name for the new document. After saving the document, you can then proceed to make the desired changes.

You can make changes in a stationery pad by turning off the "Stationery pad" attribute through the Info box, making the desired changes, then turning the attribute back on.

## CD-ROMs: Accessing Multiple Discs Remotely

Revised: 9/13/91  
Security: Everyone

CD-ROMs: Accessing Multiple Discs Remotely

=====

Article Created: 12 July 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have a lot of essential data on several CD-ROMs. Rather than carry them all -- plus a drive -- with me on customer calls, I'd like to keep them in a multi-disc CD-ROM changer in my office and access them with my Macintosh Portable from remote sites. What hardware and software would I need?

DISCUSSION -----

What you propose is very workable.

Hardware and Software Requirements

-----

At Your Home Base:

- a Macintosh system with Timbuktu Remote installed
- a modem connected to a telephone line
- a multi-CD changer (such as the Pioneer DRM 600)
- multiple CD-ROMs mounted on the desktop

The Remote System:

- a Macintosh (Portable or other model) with Timbuktu Remote installed
- a modem connected to a telephone line

The Procedure

-----

Use the remote system (with Timbuktu Remote and modem) to dial in to the home base. You can then manipulate the home-base system as though you were there. You will have access to the information on all of the CD-ROMs (as well as resources such as printers, file servers, etc.) back at your office.

For Further Information

-----

For contact information, search the Tech Info Library on "Farallon"  
(Timbuktu Remote) and "Pioneer".

## System 7: How to Customize the Puzzle

Revised: 9/11/91  
Security: Everyone

System 7: How to Customize the Puzzle

=====

Article Created: 12 July 1991

### Article Change History

-----

08/25/92 - REVIEWED

- For accuracy.

### TOPIC -----

Can I customize the color Puzzle in System 7's Apple menu?

### DISCUSSION -----

Yes. Start by making a duplicate of the Puzzle, so that after making a custom Puzzle, you'll still have the original.

- 1) Put a graphic, one that is about the same size as the Puzzle itself, on the Clipboard.

Some possible sources:

- a HyperCard or MacPaint bitmap
- a screen dump or other PICT copied using System 7's new TeachText program.

- 2) Open the Puzzle, and choose Paste from the Edit menu. The graphic is copied from the Clipboard into the Puzzle, and scrambled.  
(To see the graphic unscrambled, choose Show Clipboard from the Finder's Edit menu.)

## System 7: Starting Filenames with Space Character

Revised: 9/11/92  
Security: Everyone

System 7: Starting Filenames with Space Character

=====

Article Created: 12 July 1991

### Article Change History

-----

09/11/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

Earlier versions of Macintosh system software didn't allow filenames to begin with a space character, but System 7 does allow this.

### DISCUSSION -----

If you begin a filename with a space character, then use "View by Name", that file will appear at the top of the list. This is a good way to force important files to the top of the alphabetical list.

## System 7.x: Changing Sequence of Apple Menu Items (2/95)

Revised: 2/21/95  
Security: Everyone

System 7.x: Changing Sequence of Apple Menu Items (2/95)

Article Created: 25 July 1991

TOPIC -----

I have installed so many desk accessories in my Macintosh system that my Apple menu is longer than my monitor is high. Further, some of the menu items I use most often are near the bottom of the list, and scrolling to them is annoying. Is there a way to force a few of my menu items to the top of the alphabetical list -- without renaming them?

DISCUSSION -----

There is an easy way to force a few of your menu items to the top of the alphabetical list - without renaming them.

For example, if you change "Scrapbook" to " Scrapbook" (with a leading space), then it appears in the Apple menu ahead of "Alarm Clock" and "Chooser".

In the Finder, open your System Folder, then your Apple Menu Items folder, and change the names of the menu items as you would any other filenames.

You might also want to experiment by putting various punctuation symbols at the beginning of the items in your Apple menu to see how this affects the sequence. If you still feel the menu is cluttered, make an empty folder named simply with a row of hyphens (or any other character) and use it as a divider (with leading spaces to position it appropriately) between, say, folder aliases and application aliases in your menu.

## LattisNet System 3000

Revised: 9/13/91  
Security: Everyone

LattisNet System 3000

=====

Article Created: 7 June 1991  
Article Last Reviewed:  
Article Last Updated:

### TOPIC -----

This article describes the LattisNet System 3000, manufactured by SynOptics

### DISCUSSION -----

SynOptics' Network Utility Architecture defines local area networks as utilities, and combines three elements: connectivity, internetworking and network management. Physical layer connectivity includes access methods such as Ethernet, Token Ring and Fiber Distributed Data Interface (FDDI). Internetworking, used in larger networks, refers to bridges and routers. Network management systems keep complex networks running reliably and efficiently.

The LattisNet System 3000 provides integrated LAN data Communications, internetworking and network management functions within a single network utility. Modular components satisfy a variety of network needs.

System 3000 concentrators provide a common platform to support the Network Utility Architecture. The Model 3000 Premises Concentrator and the Model 3030 Department Concentrator hold the modular components that provide basic connectivity, integrated bridging, and network management utility functions.

A modular backplane supports IEEE 802.3-compatible Ethernet at 10 megabits per second (MB/s) and IEEE 802.5 Token Ring at 4MB/s and 16MB/s. System 3000 concentrators offer increased LattisNet module and port density to support more nodes with less equipment.

System 3000 host modules offer network connectivity. Ethernet host modules

provide media flexibility by offering twisted pair and FOIRL fiber optic interconnections. Token Ring host modules operate over twisted pair wire. Auto-partitioning functions disable port connections under specific Ethernet fault conditions to ensure network integrity. Front-panel LEDs indicate link status, partitioning, and network management activity. System 3000 Token Ring ring-in/ring-out modules connect to other Token Ring-compatible devices to create larger LANs. Ethernet retiming modules help satisfy the IEEE 802.3 repeater function.

The bridge hardware and bridge management software provide integrated modular local bridging capabilities. LattisNet Ethernet local bridge modules have attachment unit interface (AUI) and fiber optic connector options to interconnect network segments and form single, transparent LattisNet networks. LattisNet local bridges filter operator-defined data packets and include a Spanning Tree Algorithm function which provides a redundant network path for rapid recovery from bridge or link failures.

The network management capabilities include planning, data monitoring, problem determination and fault isolation from a centralized console. Network management modules offer AUI and fiber optic connector options. Real-time network information is displayed graphically as a network hierarchy with Expanded Views of individual concentrators. A report generator captures and stores specific data on request. LattisNet Network Management permits individual port partitioning. It also allows the network manager to set module- and port-level activity and fault thresholds based on media access control (MAC)-level parameters and statistics.

LattisNet products implement IEEE 802.3-compatible Ethernet over twisted-pair wire and fiber optic cable. They also support both IEEE 802.5 Token Ring and 802.5-compatible networks over twisted-pair wire.

You can find the phone number and address for SynOptics in a separate article in the Tech Info Library.

## Network Guidelines

Revised: 9/13/91  
Security: Everyone

### Network Guidelines

=====

Article Created: 11 June 1991  
Article Last Reviewed:  
Article Last Updated:

### TOPIC -----

This article offers some guidelines for getting the best service from a network.

### DISCUSSION -----

- All devices on Ethernet need to be using the Phase II EtherTalk driver.
- Be sure that computers using Ethernet have EtherTalk cards, revision L or later.
- If you are using Ethernet, don't crimp or tightly wrap the cables. This degrades network performance.
- Install Responder in the System Folder of any Macintosh running 6.0.x. (Responder is built into System 7.)
- All Macintosh IIfx computers must have the Macintosh IIfx Serial Switch INIT in the System Folder. Set the Serial Switch to compatible mode to work with dial-up-connection applications and the old Star Controller model.
- Be sure all System 7 users have the same version, and no versions older than Beta 4. Inter•Poll can help find out what versions are in your network group.
- Don't daisy-chain any devices. This creates a heavy load on the network that often exceeds the capacity of the specifications.
- All spoolers must be on the same network (not just zone) as the

LaserWriter they spool to.

- Use Inter•Poll to observe the workgroup use and traffic patterns on the network.
- Check the types of software used on the network. A beta-test environment can degrade network service.

## Macintosh: Displaying Same Image on Two Monitors (12/95)

Revised: 12/20/95  
Security: Everyone

Macintosh: Displaying Same Image on Two Monitors (12/95)

=====

Article Created: 14 June 1991  
Article Reviewed/Updated: 20 December 1995

TOPIC -----

I have two video cards installed in my Macintosh II with two monitors attached.  
Can I display the same image on both monitors?

DISCUSSION -----

With the base Macintosh hardware and software, it is not possible to display a mirror image on two different displays. Video mirroring is built-in on some PowerBooks, and an add-on option to both the Macintosh LC 580 and Power Macintosh 5200 and 5300 computers.

Apple offers another solution for video mirroring called the Apple Presentation System. This external device attaches to any standard Macintosh DB-15 video port and allows you to mirror your screen on a second monitor or to a standard NTSC device such as a television or VCR.

Article Change History:  
20 Dec 1995 - Added information on the Apple Presentation system.  
30 Nov 1994 - Updated information on video mirroring.

## System 6.0.6: Don't Use It

Revised: 9/13/91  
Security: Everyone

System 6.0.6: Don't Use It

=====

Article Created: 14 June 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

How come I shouldn't use System 6.0.6 on ANY Macintosh? And why should I use System 6.0.7 only on newer Macintosh computers?

DISCUSSION -----

System 6.0.6 has compatibility problems with the new Macintosh computers. System 6.0.6 was pulled from production and replaced by System 6.0.7. There are a few versions of System 6.0.6 floating around that were sent out before the software was pulled from production.

You should use System 6.0.5 (or System 7) on most Macintosh computers made before the Macintosh Classic, Macintosh LC, and Macintosh IIsx. System 6.0.7 has features in it that only benefit newer Macintosh computers. This does not mean that you can't use System 6.0.7 on older products, it just means that it is not the recommended system.

## Display Card 8•24 GC: Compatibility With Other Video Cards

Revised: 6/11/92  
Security: Everyone

Display Card 8•24 GC: Compatibility With Other Video Cards

=====

Article Created: 14 June 1991  
Article Last Reviewed: 10 June 1992  
Article Last Updated:

TOPIC -----

How do I use a Macintosh Display Card 8•24 GC in conjunction with a third-party video card? Specifically, I'm trying to use a RasterOps Video ColorBoard 364 with the Macintosh Display Card 8•24 GC. With both cards in a Macintosh, only one card works -- depending on which slots I've put the cards in. The card that's in the slot closest to the power supply is the one that's recognized, while the other card doesn't work at all.

RasterOps says that the Macintosh Display Card 8•24 GC might not be releasing control of the bus to other graphics cards. Is this what's happening?

DISCUSSION -----

The card nearest the power supply becomes the "bus master". If your Macintosh Display Card 8•24 GC is in the bus master slot, it will take control of the bus and prevent another card with a processor on it to run.

If your third-party card is in the bus master slot, the third-party card may or may not release control of the bus, depending on its design.

Essentially, you can have only one accelerator card running at a time. If you turn the acceleration of the Macintosh Display Card 8•24 GC off, you should be able to use both video cards.

AppleShare: Finder Copying Causes ID=1 Errors

=====

Article Created: 14 June 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

When I do a Finder copy of files onto my AppleShare server folders, why do I get an ID=1 error?

DISCUSSION -----

This is because you're putting information onto your server without AppleShare being "aware" that you've done this. When you put information on the hard drive of the server with AppleShare off, the AppleShare PDS file doesn't update correctly.

You need to run the AppleShare Admin program and verify the volume to update the PDS file. A way to prevent this is to copy files to your server over the network. This updates the PDS file as your files are copied.

AppleShare: Problems Installing with System 6.0.5

=====

Article Created: 14 June 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I'm trying to set up an AppleShare file server on a Macintosh SE/30 with System 6.0.5. I used the Installer on the AppleShare File Server Installation disk, choosing only the AppleShare installation (in other words, not using the Macintosh System installation option). So far so good.

However, when I attempt to load files from the Server Administration disk, I get the message that the System file on that disk is not a recent enough version (it was System 6.0.3).

DISCUSSION -----

You need to run the Installer from a System 6.0.5 disk and create a new floppy using the option to install minimum system files for the Macintosh SE/30. After you create that startup disk, drag the AppleShare Admin program onto that floppy. You'll then be able to start up from the floppy and run the AppleShare Admin program.

Apple IIGS: How To Start Up from Floppy Disk Using Aristotle

=====

Article Created: 14 June 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I'm using Apple IIGS computers with a menu management program and a Macintosh file server. The menu management program is set as the startup application. I'm not using a network startup or "boot disk" and I don't want to. Here's my setup:

|         |           |
|---------|-----------|
| Slot 1  | AppleTalk |
| Slot 7  | AppleTalk |
| Startup | AppleTalk |

I don't want to reconfigure my Control Panel just to be able to start up from a floppy disk. But with my current settings, if I press Control-Open-Apple-Reset, the floppy drives don't do anything.

I need a way to start up from a floppy without changing any of my Control Panel settings. Can I create a program in BASIC and put it in my menu management program? Would this BASIC program, when selected, cause my Apple IIGS to start up from the floppy drive?

DISCUSSION -----

There are two ways to do what you want:

First Method

-----

- 1) Interrupt the boot process by pressing Control-Reset while the system is booting. This will give you the "]" prompt.
- 2) Type "PR#6" to tell the computer to start up from the controller card in slot 6. (If you're starting up from a 3.5-inch floppy disk, use

5 instead.)

## Second Method

-----

To do the same thing through Aristotle, simply create a BASIC program with the following line:

10 PR#6

Save this program and set it up as an Aristotle menu item. The problem here is that you must start up all the way into Aristotle before you'll get back to the ability to boot from a local drive. Control-Reset will give you the ability to boot from a local drive much sooner.

## Macintosh: Desktop Manager

Revised: 9/13/91  
Security: Everyone

Macintosh: Desktop Manager

=====

Article Created: 14 June 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have more than 1000 files on my Macintosh hard drive and am running System 6.0.5. I have an ongoing problem with fragmentation and am constantly optimizing, formatting, or reinstalling all data on my hard drive.

I've read that the Desktop file was designed back in the 400K floppy days. Should I put "Desktop Manager" in my System Folder (from the AppleShare disk)?

DISCUSSION -----

The Desktop file is capable of managing 64,000 files. The Finder really bogs down if you have more than 800 files per folder level. The Desktop Manager is not needed for only 1000-2000 files. On the other hand, it won't hurt to have it and it might increase the reliability and even make some functions more efficient.

EtherTalk 2.0.2: Where to Find ENET Driver

=====

Article Created: 14 June 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Where can I find an EtherTalk 2.0.2 driver?

DISCUSSION -----

The .ENET driver resource file installs as part of the System file when the EtherTalk driver is installed using the Network Products Installer disk that is shipped with all new computers.

Remember, there are two different drivers: one is the actual EtherTalk driver, which you can see in the System Folder; the other is the .ENET driver, which you cannot see.

If you have an older version, 2.0.2 can be acquired from AppleLink or any Apple Authorized Dealer.

Macintosh IIfx: NuBus/SCSI Speed

=====

Article Created: 14 June 1991  
Article Last Reviewed: 14 July 1992  
Article Last Updated:

TOPIC -----

I'm a little confused about SCSI data transfer. Several sources say that the speed of the SCSI port on a Macintosh IIfx is between 1.4MB and 4.0MB per second. I know that synchronous mode is needed to obtain the higher rates, but if a drive is only rated at 13 kilobytes per second with an access time of 11.9 milliseconds, how do I get rates of 2 or 3 megabytes per second?

Also, if the NuBus slots are rated at 10MB per second, wouldn't I gain by using these slots?

DISCUSSION -----

It's not the access time of the drive that matters, but rather the sustained transfer rate. Any SCSI hard drive that can sustain transfer rates above 1.25MBps will operate faster on a Macintosh IIfx compared to any other Macintosh system. None of Apple's present drives take advantage of this potential.

If a SCSI card was designed to operate with NuBus it would be limited to 10MB per second, which is faster than the Macintosh IIfx's 3MB per second spec, but much faster than any of our other drives, at this point.

Apple IIGS: System Software after 4.0 Requires 512K RAM

=====

Article Created: 14 June 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have a 256K Apple IIGS. What's the latest Apple IIGS system software version for a 256K Apple IIGS without a memory expansion card?

When I try to load System 4.0 through 5.0.2, I get a "RAM Disk Too Large" error message. When I go into the Control Panel, RAM disk is set to 0K, 84K RAM in use, and 171K free. Why is this?

DISCUSSION -----

Apple IIGS system software after version 4.x requires at least 512K of RAM. Without at least this much you'll be limited to version 3.x or earlier of system software.

We strongly suggest that you upgrade to at least 512K of memory, even if you're only going to use the earlier system software.

## Macintosh LC: Maximum Video Depth

Revised: 7/24/92  
Security: Everyone

Macintosh LC: Maximum Video Depth

=====

Article Created: 14 June 1991  
Article Last Reviewed: 23 July 1992  
Article Last Updated: 12 February 1992

TOPIC -----

What is the maximum video depth the Macintosh LC's built-in video supports?

DISCUSSION -----

The Macintosh LC's built-in video supports a maximum video depth determined by two variables:

- The size of the monitor connected to the Macintosh LC, and
- The amount of video RAM installed in the Macintosh LC.

If the Macintosh LC has 256K of video RAM installed, then the bit depth for the Macintosh 12-inch RGB display will be 8 bits per pixel, and for the 13-inch High Resolution RGB Monitor, the depth will be 4 bits per pixel.

If the Macintosh LC has 512K of video RAM installed, then the bit depth for the Macintosh 12-inch RGB display will be 16 bits per pixel, and for the 13-inch High Resolution RGB Monitor, the depth will be 8 bits per pixel.

Four bits per pixel will give you 16 colors or shades of gray on the screen at one time. Eight bits will give you 256 colors or shades of gray. Sixteen bits will give you thousands of colors.

It's possible to achieve 24 bits per pixel on the Macintosh LC through third-party Macintosh LC PDS video cards.

## Macintosh LC: Using with Third-Party Color Monitors

Revised: 10/28/92  
Security: Everyone

Macintosh LC: Using with Third-Party Color Monitors

=====

Article Created: 14 June 1991

### Article Change History

-----

10/28/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

I want to get more than the 256 colors on a Macintosh LC. Will the optional 512K VRAM SIMM that provides 32,000 colors on an Apple 12-inch RGB monitor be any benefit to a third-party monitor?

Is it true that a third-party monitor won't be "plug and play" on a Macintosh LC without an additional video card?

### DISCUSSION -----

Yes, the expansion option will benefit other monitors. The amount of pixel depth will depend on the size of the monitor. For a 12-inch monitor, there will be 32,000 colors; a 13-inch monitor will have 256 colors.

Third-party compatibility depends on the monitor. If the monitor matches scan rates and resolution, it should work. Ask the manufacturer for compatibility information.

Macintosh LC: Expansion Board Not Necessary for RAM Upgrade

=====

Article Created: 14 June 1991  
Article Last Reviewed: 23 July 1992  
Article Last Updated:

TOPIC -----

My Macintosh LC Owner's Manual says that the Macintosh LC comes with 2MB of RAM on the motherboard that can be upgraded by adding another board AND THEN adding SIMMs to this additional board.

It certainly looks like I can put two or more 1MB SIMMs right onto what looks like two SIMM slots on the system board. To the left of these slots is a big chip. Is that the 2MB of RAM is this a ROM chip? If it's a ROM chip, are those four little chips to the left of that the RAM?

DISCUSSION -----

The Macintosh LC doesn't need a memory expansion card. If the manual states that, it is incorrect. Simply adding two SIMMs will upgrade the memory.

Macintosh LC RAM is on four chips on the other side of the ROM SIMM socket. These RAM chips are labeled "DRAM".

To see the possible memory chips and configurations for the LC, search under "DRAM Specifications".

## Macintosh II Family: Monitor Noise at Startup is Normal

Revised: 9/16/91  
Security: Everyone

Macintosh II Family: Monitor Noise at Startup is Normal

=====

Article Created: 14 June 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Many Macintosh II monitors make a loud noise when powering up. The high-resolution monochrome and color models seem to make this noise consistently. Is there a problem with these monitors, or is this just a characteristic of the monitor?

DISCUSSION -----

The sound that you hear is the degaussing coil being activated on power-up. Color monitors are subject to impurities from other magnetic fields. This is countered by putting a neutralizing field around the front of the CRT on power-up or by pressing the degaussing coil button on the back of the monitor.

The sound is simply the coil energizing and is in no way a sign of current or future problems.

## Apple High Resolution RGB Monitor: Technical Q&A

Revised: 9/16/91  
Security: Everyone

Apple High Resolution RGB Monitor: Technical Q&A

=====

Article Created: 14 June 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have some technical questions about the Apple 13-inch High-Resolution RGB monitor:

- 1) What is the pixel size?
- 2) What's the pixel interleave?
- 3) How much time does it take to turn pixels on and off?
- 4) What's the wavelength range from blue to red?
- 5) What's the maximum brightness of the screen?
- 6) Can the Macintosh hardware handle programming to command video cards to display objects on the desktop (circles, squares, and so on, with different colors?)

DISCUSSION -----

- 1) Pixel size (also known as "dot pitch" or "grill pitch") is 0.25mm.
- 2) There are no specifications on pixel interleave. If the request is for the sequence of placing pixels on the screen, then the following discussion should assist in understanding how the monitor works.

Video cards that drive the AppleColor High Resolution RGB Monitor use an approximation of the RS343 display signal. (RS video standards are set by the Electronic Industries Association.) The RS343 display standard is essentially a monochrome video signal combined with a

composite sync signal (horizontal and vertical scan control) with timings that produce a non-interlace, or progressive, scan. This means that the horizontal and vertical scan rates are timed to cause the display electron guns to produce even progressively horizontal scans. This is by comparison to the interlaced video standards. The importance of the RS343 standard is its provision for a timing and voltage level signal that allows the display and generation of high resolution video.

While the Macintosh II version of the RS343 signal varies somewhat, it essentially follows the guidelines necessary for connection to RS343 display devices. The major differences are:

- the separate TTL level composite sync signal found on pin 3
- the separate video lines used to produce RGB color
- a vertical scan rate of 66.67Hz to reduce screen flicker
- a voltage white level of 1 volt for its red and blue signals and 1.3 volts on its green signal

RS343 provides for a 60hz signal but has been changed to 66.67Hz on the Macintosh II Video Card, to prevent the screen flicker visible at 60Hz.

- 3) The pixel clock frequency is 30.24 MHz. The only other specification that would appear to relate to this issue is phosphor persistence, which is rated by phosphor vendors as medium-short.
- 4) Due to contractual agreements, this information is not available.
- 5) Luminance level is 20 footlamberts with the brightness control in the center detent position. With the brightness control in the full-open position, the luminance level is 25 footlamberts.
- 6) The Macintosh firmware (the Macintosh Toolbox) has QuickDraw routines to handle the creation of the desired objects. Typically, the video cards are not "commanded" to display objects. Video cards will display the information that is placed in the video buffer. QuickDraw is used to place the information in that video buffer. The only possible exception is when a graphics coprocessor card is placed in the Macintosh. However, the Macintosh interface to these specialized video cards is still through QuickDraw. Although, now QuickDraw is being executed by the graphics coprocessor, not by the system's primary CPU.

PostScript: How To Create PostScript Text Files

=====

Article Created: 14 June 1991  
Article Last Reviewed: 15 July 1992  
Article Last Updated: 15 July 1992

TOPIC -----

I want to output PostScript files from my Macintosh to a VAX. I plan to use a conversion utility to interpret the PostScript file and translate it into SIXEL graphic data for output to a laser printer.

How do I get the Macintosh to create this PostScript text file?

DISCUSSION -----

Here's how to print a PostScript image "to disk" rather than to a printer:

First, use the Chooser to select a LaserWriter. Then, choose Print... from the File menu.

Under System 7, click "PostScript File" instead of "Printer" in the Destination option of the Print dialog, and click Okay.

Under System 6, click Okay, then immediately hold down the Command key and press either:

- The "K" key (to dump a PostScript image with LaserPrep), or
  - The "F" key (to dump PostScript without LaserPrep).
- Hold the keys down until you see the Print Status dialog box.

A text file will appear containing the PostScript text.

Macintosh II Family: Specifications for Rear Case Screw

=====

Article Created: 14 June 1991  
Article Last Reviewed: 25 June 1992  
Article Last Updated:

TOPIC -----

On the back of all Macintosh II computers, there's a hole where a small machine screw can be threaded. A screw can go through this hole when the cover is on and lock the cover down.

I want to use special security screws in these holes so that no one can remove the cover. I need to know the proper screw size and length to use for the Macintosh LC, Macintosh IIsi, Macintosh IIfx, and Macintosh IIfx.

DISCUSSION -----

The case screw size (identical for all Macintosh II systems including the Macintosh II, IIfx, IIfx, IIfx, IIfx, and IIsi) is M 3.5 x 0.6 x 8.

The Macintosh IIsi and the Macintosh LC are shipped without case screws. It was determined during the design phase that no screw was needed, so it was left off. However, the case was not changed and the hole in the power supply of the Macintosh IIsi remained.

It is possible that the hole will not be present in future revisions. In that case, if a power supply had to be replaced, it would be possible to receive one without the hole. This would make it impossible to use a case screw. The Macintosh LC has a screw hole in the case, but it does not align with anything inside the system. Therefore, no screw can be used in the Macintosh LC.

AppleShare: Dealing With "No Valid Startup Volume Found" Message

=====

Article Created: 14 June 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I've been using a Macintosh AppleShare File Server for about six months with no problems. Suddenly, when it was restarted after a power failure, I got a message that I needed to run AppleShare Admin again.

I ran the Admin program, then after restart, I got the error message "No valid startup volume found".

DISCUSSION -----

Here are the steps you should take:

- 1) Do a file-by-file backup of your volume. Keep in mind that a file-by-file backup will not retain access privileges, so you'll have to recreate them if you need to restore from this backup.
- 2) Since the volume is not available to the application, you will have to re-prepare the volume for use with AppleShare and recreate the parallel directory structure (PDS). You will lose access privileges doing this -- but you'll lose no data. This should get you back to a functioning server.
- 3) If the problem persists, reinitialize your volume, prepare for use with AppleShare, and restore all your files from the backup you did before starting.

Article Last Updated: 21 July 1992

TOPIC -----

My Macintosh keeps giving me a "Non-Apple Disk Error" when I insert a floppy disk, and asks me if I want to reformat the disk.

DISCUSSION -----

If it occurs only with one or two diskettes, there may be a problem with those disks and not the drive. If this problem only occurs when using disks of a certain brand or density, consider trying another brand of diskette. If a given diskette produces the same error in another computer, then almost certainly the problem is with that disk.

However, if this happens no matter what disk you insert - even master application disks - the problem most likely is with the disk drive itself.

IBM SCSI Drives: Using them in a Macintosh

Article Created: 14 June 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Is there a difference between Apple SCSI and everyone else's SCSI? What are the differences between IBM SCSI and Apple SCSI, particularly with hard drives? Can I use an IBM 20MB SCSI hard drive in a Macintosh? Any warranty problems (would it void your warranty or AppleCare)?

DISCUSSION -----

If you swap just the hard drive mechanism, it should work. The controller will be different--the ROM in particular.

There really isn't an Apple SCSI vs. Standard SCSI. ANSI determines the SCSI standards, and Apple provides input to the standard. The problem is that SCSI is an evolving standard.

ANSI is the American National Standards Institution

This would not be an approved repair for an Apple Warranty or AppleCare.

Ultrasonic Humidifiers and Computer Equipment (11/94)

=====

Article Created: 14 May 1991  
Article Reviewed/Updated: 10 November 1994

TOPIC -----

The inside of my computer is coated by something other than dust. The only source of contamination seems to be my cool mist humidifier.

Is there any information regarding ultrasonic humidifiers and their effects when placed close to computers? Specifically, can the mineral mist be attracted to the electrical components inside a Macintosh or LaserWriter?

DISCUSSION -----

Dust in general is not good for computers: it causes heat build up and gets between the various connectors, particularly the SIMMs which can cause errors or other operational problems.

An ultrasonic humidifier should not cause any more damage than common dust.

Apple IIGS: Use Third-Party Memory Cards with HyperCard

=====

Article Created: 14 June 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

We have a classroom with 15 original Apple IIGS computers and one instructor station. Each workstation has an Apple 1MB board installed. We will be teaching using HyperCard for the Apple IIGS. What is the cheapest way to add more memory to our computers?

DISCUSSION -----

Apple does not offer a memory expansion card for the original Apple IIGS that goes beyond 1.25MB of memory. There are several third-party memory cards for the Apple IIGS that can handle HyperCard's memory requirements.

Check the Redgate Macintosh Registry on AppleLink for further information.

Apple Monitors: Nearby Interference can Cause Horizontal Lines

=====

Article Created: 14 June 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Why is there a horizontal scan line that keeps cycling across my 12-inch color monitor screen?

DISCUSSION -----

The line you are seeing is caused by a 60Hz noise somewhere near the monitor. The horizontal scan rate of the monitor is 60.15Hz so it is very susceptible to external noise in the 60Hz area. The only solution is to find the source of the noise and move it or the monitor. The noise could be from a lamp or anything else plugged into a nearby outlet.

You may also want to try turning the monitor in different directions to see if things improve at all. The interference may change due to magnetic fields regarding the north and south poles.

Display Card 8•24 GC: Problems with PC 5.25 Drive Card (11/94)

=====

Article Created: 14 June 1991  
Article Reviewed/Updated: 10 November 1994

TOPIC -----

I've been having problems with my Macintosh Display Card 8•24 GC with a PC 5.25 Drive card. I removed the Apple PC 5.25-inch Drive card from my Macintosh, re-accelerated the Macintosh Display Card 8•24 GC, and everything works fine.

DISCUSSION -----

The Apple PC 5.25 Drive sometimes clashes with the NuBus clock. This happens because the card has a 13-inch trace and six leads on that line. Symptoms of this issue include other installed NuBus cards not functioning properly. For example, NuBus video cards do not appear installed, and networking cards do not provide access to a network.

Putting the card in slot \$E helps minimize the problem. If you experience a problem, try running with the PC 5.25 Drive card in slot \$E.

## Apple IIe Card: Macintosh Compatibility (11/96)

Revised: 11/15/96  
Security: Everyone

Apple IIe Card: Macintosh Compatibility (11/96)

Article Created: 14 June 1991  
Article Reviewed/Updated: 14 November 1996

TOPIC -----

Which Macintosh computers are compatible with the Apple IIe Card?

DISCUSSION -----

The Apple IIe card is only compatible with computers that have the LC style processor direct slot (PDS) and do not require 32-bit addressing. This includes:

- Macintosh Color Classic
- Performa 400 series
- Macintosh LC/Performa 500 series computers (except the Macintosh LC 580 and Performa 580)
- Macintosh LC series computers except: Macintosh 630 family, Power Macintosh 5200 and 5300 LC, Macintosh Performa 5200, 5300, 6200, 6300 series.

The Macintosh LC 580, Macintosh 630 Family, Power Macintosh 5200 and 5300 LC, Performa 5200/5300 and 6200/6300 series only operate in 32-bit addressing mode. Since the Apple IIe card is not compatible with 32-bit addressing, the Apple IIe Card is not compatible with these computers.

The Power Macintosh 5400 and 6400 series and the Macintosh Performa 6400 series and 6360/160 computers do not have LC-PDS slots. These computers have PCI expansion slots. Thus, they do not support the Apple IIe card.

Note:

The following computers are in the Macintosh 630 family: Performa 630, Performa 635, Performa 636, Performa 637, Performa 638, LC 630, and Quadra 630.

Begin\_Table

Compatibility Table

TOPIC -----

What are the limitations regarding the Macintosh Classic and third-party internal hard drives, specifically power consumption and physical size?

DISCUSSION -----

An internal hard drive for the Macintosh Classic drive must not be more than "1/3 height" (meaning one inch) in height. There simply isn't any room for larger hard drive.

The exact power figure for the Macintosh Classic's drive connector is 10 watts, but power consumption isn't an issue for most 1/3 height drives.

Laser Prep: Must Be In Sync With LaserWriter Driver

=====

Article Created: 14 June 1991  
Article Last Reviewed: 15 July 1992  
Article Last Updated: 15 July 1992

TOPIC -----

I'm having problems with printing from my Macintosh since upgrading my Laser Prep file. I keep getting "Print Monitor unexpectedly quit" errors and lock-ups.

DISCUSSION -----

There is no upgrade of just the Laser Prep file. LaserWriter and Laser Prep must be upgraded together. For example, you need to use LaserWriter 5.2 with Laser Prep 5.2 or LaserWriter 6.0 with Laser Prep 6.0.

Note however that Laser Prep is no longer required as of version 7.0 of the LaserWriter driver. The System 7 version of the driver sends the prep information along with each print job. Any Laser Prep files that for some reason remain in the System Folder will not cause any damage, but also will not help printing. They can be trashed.

Macintosh II Family: Improving Sound Sampling Rate

=====

Article Created: 14 June 1991  
Article Last Reviewed: 25 June 1992  
Article Last Updated:

TOPIC -----

I want to get better sound quality out of my Macintosh IIsi. I've read that the Macintosh IIsi can sample sound at 11kHz and 22kHz. How can I change my sampling rate to 22kHz? Can I also upgrade my sound chip from 8-bit to 12-bit?

DISCUSSION -----

The sampling rate for the Macintosh IIsi is set at 11khz by the software that comes with the Macintosh IIsi. Third parties will be delivering software that will take advantage of the greater sound capabilities of the Macintosh IIsi in the near future.

There's no way for you to upgrade the Macintosh IIsi sound chip as it is soldered to the logic board. Any upgrade has to be done by Apple at the factory.

In terms of hearing a better output, you hook up your Macintosh to a stereo system, or simply attach some speakers to the Sound Port on the back of the Macintosh. Bose is one company that makes speakers that are popular with the Macintosh.

Third-Party Hard Drives: Changing Their Desktop Icons (4/95)

=====

Article Created: 14 June 1991  
Article Reviewed/Updated: 03 April 1995

TOPIC -----

Even though I've completely reformatted my third-party hard drive, the drive keeps appearing on my Desktop with the third-party's icon. How can I do a low-level drive format to remove their icon?

DISCUSSION -----

Apple does not supply a low-level formatting utility with any of our system software. This level of formatting is handled by the third-party vendor before they ship their drives. Apple's drive utility software only initializes the drive.

You might want to try Silverlining from LaCie. Silver Lining can give you back the generic icon. There are also some icon altering utilities.

To locate a vendor's address and phone number, use the vendor's name as a search string in the Tech Info Library.

Article Change History:  
03 Apr 1995 - Corrected wording of Silverlining.

Macintosh IIfx: Problems Getting Internal Hard Drives to Start

=====

Article Created: 14 June 1991

### Article Change History

-----

11/04/92 - UPDATED

- To explain that there is a small power trace difference on the Macintosh II and Macintosh IIfx logic boards.

### TOPIC -----

My internal hard drive stopped working after upgrading my Macintosh II to a Macintosh IIfx. The drive just clicks and won't spin up.

I've been told by the drive's manufacturer that this is because the power trace on the Macintosh IIfx motherboard is half the size of the same power trace on the Macintosh II. Is this correct?

### DISCUSSION -----

There is small difference in the power trace from the Macintosh II to the Macintosh IIfx. However, the difference would be within the limits of the power draw specifications that we require drive manufactures to meet.

If your particular drive is drawing more than Apple allows, you'll need to swap drives for one that does not require so much power to spin up.

AppleShare: Macintosh LC vs. Macintosh SE/30 Performance

=====

Article Created: 14 June 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

What are the advantages and disadvantages of using the Macintosh LC as an AppleShare file server compared to a Macintosh SE/30 or Macintosh II (besides the available expansion slots in the Macintosh II)? Does AppleShare take advantage of the MC68881/MC68882 math co-processors? Are there any compatibility problems between AppleShare 2.01 and the Macintosh LC?

DISCUSSION -----

Compared to a Macintosh SE/30, the Macintosh LC is slower. The Macintosh LC uses a 68020 chip where the Macintosh SE/30 uses the 68030 processor.

There are no known compatibility issues between AppleShare 2.0.1 and the Macintosh LC. If speed is not an issue and price is, the Macintosh LC would be a good choice for a file server.

AppleShare really doesn't utilize a math co-processor so this is not really a factor.

## Macintosh: Troubleshooting Multiple Hard Drive Icons (12/95)

Revised: 12/6/95  
Security: Everyone

Macintosh: Troubleshooting Multiple Hard Drive Icons (12/95)

=====

Article Created: 14 June 1991  
Article Reviewed/Updated: 05 December 1995

TOPIC -----

When I start up my Macintosh, multiple icons of my hard drive mysteriously appear on my Desktop.

DISCUSSION -----

There are several causes of this symptom, including SCSI ID conflicts, damaged system software, or corrupted PRAM.

The most common cause is having a SCSI device with a SCSI ID 7, which is the same address reserved for the computer. To resolve this, check to see if either the internal or external hard drive or other SCSI device has a SCSI ID 7. If so, change it to a unique number; all devices on the SCSI bus must have different SCSI ID numbers.

Next, try starting up from the system software CD or Disk Tools floppy disk. If you do not see multiple hard disk icons when starting up this way, then you likely need to reinstall your system software. If you still see multiple hard disk icons, use HD SC Setup or Drive Setup to update the hard disk driver.

If the multiple SCSI disk icons persist, then reset the PRAM. To do this, hold down the Command-Option-P-R keys simultaneously as you start up the computer. Do not release the keys until you hear two startup chimes.

### Article Change History:

05 Dec 1995 - Updated with additional causes.  
24 Oct 1994 - Revised to show that any SCSI device can cause the problem.

AppleShare: Problems Using Chooser with Apple II Computers

=====

Article Created: 14 June 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I recently set up an AppleShare Network with Apple II and Macintosh computers. All seemed well except for a small item on the Apple II side.

Using Aristotle, everything works fine except the Chooser.

When trying to use Chooser, the window opens to show the application just short of finishing. The Chooser then stops with a message that it cannot load or open:

/System/System.Setup/ATInit

How can I repair the above file without reinstalling the entire AppleShare network?

DISCUSSION -----

If you're using Apple IIGS computers, you don't need to use the Chooser anymore. Select printers with the Control Panel.

If you're using Apple IIe computers, be sure you use the AppleShare Apple II Setup Disk 2.1.1 or greater when setting up your server.

Macintosh: Opening Documents and Differing Application Versions

=====

Article Created: 13 June 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

When I double-click on a document, the Macintosh Finder also launches the application that created the document. However, when there is more than one copy of an application on a volume, the copy of the application that gets launched isn't predictable.

- 1) How does the Finder determine which application to launch?
- 2) Can I control which version of the application will be launched?

This problem is especially annoying when still working with HyperCard 1.2.x and 2.x.

DISCUSSION -----

- 1) There are two different answers to this question, one for System 6 and one for System 7:

In System 6, a volume that has two or more copies of an application, or where there are different versions that use the same creator, the last copy installed on that volume is the one that launches.

In System 7, the application with the most recent creation date is the one that launches.

- 2) There is no way to change this. However, a sure way to eliminate the version confusion is to change the Creator of the applications you don't want to launch.

For example, use ResEdit to change the creator of HyperCard from "WILD" to "FRED". When you double-click on a stack, the system will go looking for the application whose creator matches the creator of the document (stack). If you have another copy of HyperCard (say, 2.0v2) on a mounted device, it will be launched. Saving files from the changed application is unaffected (they still have "WILD" for their creator).

So, your solution is to change the creator of all non-current HyperCard applications to something other than "WILD" (try "DLIW"; it's probably not used by other applications). All stacks launched will come up in HyperCard 2.0v2. Opening the stacks in other versions is done by launching the application and using "Open..." in the file menu.

A/UX 2.0.1: Solution for "syschk" Error Problem

Article Created: 13 May 1991

### Article Change History

-----  
08/31/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

I'm having a problem with the System Checker disk of the A/UX v2.0.1 release: the shell script syschk is not executable (protection 444 instead of 555). I changed the protection to the right value and then I got an error message when running the syschk command: "Message too long".

### DISCUSSION -----

We have verified the problem. The 'syschk' Korn Shell script file in the A/UX 2.0.1 distributed System Checker disk seems to be missing some "echo" statements before the displayed error message. The echo statements should be inserted before the displayed message, around lines 145 and 168 in the syschk script file. They should be changed to the following:

```
        if [-n $noopt"]; then
        echo "\n          <===== inserted
Error - insufficient room in / partition.
At least $need more free blocks needed to install optional files.
Optional file (manuals, games) disregarded in calculations.
"          <===== inserted

        if [-n $noopt"]; then
        echo "\n          <===== inserted
Error - insufficient room in /usr partition.
At least $usrneed more free blocks needed to install optional files.
Optional file (manuals, games) disregarded in calculations.
```

"

<===== inserted

Note: If the script was written in Korn Shell not Bourne Shell, use 'ksh syschk' instead of 'sh syschk'. The 'syschk' file is unnecessarily changed to executable if it is invoked by 'ksh syschk'. The "Message too long" message results from the Bourne Shell.

## A/UX Sockets and FASYNC Signal

Revised: 9/24/92  
Security: Everyone

A/UX Sockets and FASYNC Signal

Article Created: 13 June 1991

### Article Change History

-----  
08/31/92 - REVIEWED  
o For technical accuracy.

### TOPIC -----

I'm trying to port a BSD sockets-based application to A/UX. I'm running on Sun and DEC Ultrix platforms.

My problem is I can't find support for sending asynchronous signals via sockets. Other platforms have a flag in the file control header /usr/include/fcntl.h called "fasync". The flag is needed to send asynchronous signals.

Does Apple support this feature?

### DISCUSSION -----

We looked into the /usr/include/fcntl.h file on an Apple Campus UNIX machine (apple.com, a BSD 4.3 UNIX system), and the FASYNC flag is defined in the /usr/include/fcntl.h header file. In A/UX, instead of defining in the /usr/include/fcntl.h file, it is defined in the "/usr/include/sys/file.h" file with this statement:

```
#define FASYNC 0x00000040 /* signal pgrp when data ready */
```

Therefore, we think it is supported in A/UX because the BSD socket library is supported under A/UX.

MacTCP: Broadcast Address Ranges, Problems & Workarounds (6/94)

Article Created: 13 June 1991  
Article Reviewed/Updated: 29 June 1994

TOPIC -----

I am running into a problem with the TCP connection tool. I'm trying to run MacX and Telnet/TCP. Both are failing. I can run Telnet that uses its own TCP/IP, so I know that the physical connection is there.

When I try to run MacX, I get the message, "none of the connection tools are working at the moment...". And with Telnet/TCP 2.3, I get the familiar flash of the screen and then it quits to the Finder. I've worked with MacX and MacTCP on several occasions, so I don't think it's an installation Error.

I have gotten this same error message when a gateway has been down. That leads me to believe that there is a configuration problem on the host/network side.

Host:  
Sun 128.0.0.2  
subnet FFFF0000  
broadcast 128.0.0.0 had them change to 128.255.255.255

- 1) What are the valid IP address ranges for class A, B, and C IP nodes?  
Is this documented in any specific RFC?
- 2) Is it true that if a host TCP/IP implementation uses zeros for broadcast address bits, that:
  - Can't interoperate with it and A/UX or MacTCP?
  - The host must have a new implementation of TCP/IP added to make it interoperable?
- 3) Do you know of any "standard" written down in an RFC?

DISCUSSION -----

MacTCP does NOT support 0's as broadcast address bits, so your systems need to be reconfigured to support 1's as broadcast bits. Changing your Sun and MacTCP values fixes the problem:

Hosts:

Sun: 128.1.1.1

subnet: 255.255.0.0

broadcast: 128.0.255.255

Macintosh: 128.1.1.4

subnet: 255.255.0.0

broadcast: 128.0.255.255

MacTCP-based application error messages often leave out the most common error possibility -- an invalid address. MacX, for example, gave the error message to check installation of the MacTCPTool, when in fact it was the IP addressing scheme itself that was wrong.

MacTCP DOES accept "INVALID" TCP/IP addresses without complaining, and will then fail to attempt any connections with those addresses. You can configure "invalid" addresses, like 128.0.0.0 or 0.0.0.255, without any complaints, but there will not be any support for application services on top of them.

1) Here are the valid IP address ranges for:

Valid Class A IP addresses: 1.0.0.1 through 127.255.255.254. In a class A IP address, the first octet contains the network number. The second, third, or fourth octet must contain a non-zero value. Examples of valid addresses include: 17.5.0.0; 45.0.0.200; and 50.0.120.0.

Valid Class B IP addresses: 128.0.0.1 through 191.255.255.254. In a class B IP address, the first and second octets contain the network number. The third or fourth octet must contain a non-zero value. Examples of valid addresses include: 135.0.17.0; 160.0.0.210; and 180.22.120.0.

Valid Class C IP addresses: 192.0.0.1 through 223.255.255.254. In a class C IP address, the first, second, and third octets contain the network number. The fourth octet must contain a non-zero value. Examples of valid addresses include: 221.5.0.1; 198.0.0.200; and 202.0.120.23.

Also internet addresses in the range 128.0.rrr.rrr, and 192.0.0.rrr are reserved. MacTCP doesn't allow use of this address, and issues a "bac ip or LAP configuration error".

2) MacTCP, under the Macintosh OS, uses 255 for broadcasts, not zero. In other words, a broadcast on a class network would use an address like this: 17.255.255.255, not 17.0.0.0. A/UX, or MacTCP running under A/UX, can be configured to use zero for broadcasts (for example 17.0.0.0).

You cannot use MacTCP, under the Macintosh OS, on a network that does

not use 255 for broadcasts.

3) RFC 1166 is the document with the information you need.

## A/UX 2.0.1: Problem Recognizing 800K Drives with Macintosh IIfx

Revised: 8/17/93  
Security: Everyone

A/UX 2.0.1: Problem Recognizing 800K Drives with Macintosh IIfx

Article Created: 13 June 1991  
Article Reviewed/Updated: 17 August 1993

TOPIC -----

I am using A/UX on a Macintosh II that has been upgraded to a Macintosh IIfx.

A/UX seems to think my 800K floppy drive is a 400K drive and that it is bad. In fact, we can format floppies to 800K and otherwise use the drive. But the A/UX Finder and DOSMounter certainly believe that the drive is 400K and will only format it or use it as 400K.

An Apple Macintosh IIfx with an FDHD and an 800K drive, booting under A/UX release 2.0.1 version SVR2 has the following symptoms:

- The 800K floppy drive is only recognized as a 400K drive.
- Part of the message from the A/UX kernel during boot reads "FD:floppy driver ver. 1.9; iop swim, D1 is 400K (1 head), D0 is an FDHD drive."  
"FD: D1 400K drive unusable."
- If the unit is not booting under A/UX, the 800K drive operates as expected.

DISCUSSION -----

It is a floppy driver incompatibility in A/UX 2.0.1 with a Macintosh IIfx. On a Macintosh IIfx, the driver incorrectly identifies the drive as a 400K drive, and claims it's unusable because 400K drive hardware isn't supported on the Macintosh II series systems. If you insert a blank floppy, however, you can format it, but only as 400K single-sided floppy. The drive is still usable as a 400K drive.

You can still read and write existing 800K floppies, even though the drive says you can't.

This problem has been fixed with A/UX 3.0 and above.

## Color Picker: Relationship of Values to RGB Gun Voltages

Revised: 6/15/92  
Security: Everyone

Color Picker: Relationship of Values to RGB Gun Voltages

=====

Article Created: 13 June 1991  
Article Last Reviewed: 22 May 1992  
Article Last Updated:

TOPIC -----

Is there any relationship between the 65535 values (for example, of the Color Picker) and the analog voltages of RGB guns in color monitors?

DISCUSSION -----

There isn't a direct relationship between the two, but there is a proportional relationship.

A zero setting of the Color Picker's red field causes minimum volts at the red gun of the monitor. The 65535 setting of the Color Picker's red field gives maximum voltage at the red gun. The same is true of the blue gun and the green gun.

No two monitors have the same voltage settings, because of differences in the gamma tables, the analog adjustments of the monitor, and the monitor's voltage specifications.

(The following discussion assumes the ability to measure the voltages of the guns in the color monitor.)

To get the exact voltage relationship to Color Picker values requires selecting the uncorrected gamma table in the Monitors CDEV.

- 1) Hold down the option key while selecting the option button in the CDEV.
- 2) Once the uncorrected gamma table is in use, set each of the red, blue, and green values of the Color Picker to 0 (zero). Measure the voltage of the guns. This will be the minimum voltage of the guns.

- 3) Set each value of the red, blue, and green Color Picker fields to 65535. Now measure the voltage of the guns. This will be the maximum voltage produced by the guns.

As long as the uncorrected gamma table is in use, there should be a linear relationship between the Color Picker values and the gun voltages.

However, the analog adjustments of the monitor can affect the linear nature of this relationship. Also, if a corrected gamma table is selected, the linear relationship is further perturbed.

## System 7: Virtual Memory and Largest Unused Block (9/93)

Revised: 9/23/93  
Security: Everyone

System 7: Virtual Memory and Largest Unused Block (9/93)

Article Created: 13 June 1991  
Article Reviewed/Updated: 23 September 1993

TOPIC -----

My Macintosh has 4MB of RAM, and I set it to 24-bit addressing mode with 13MB of virtual memory. I see the following distribution of RAM according to "About This Macintosh."

|                      |         |
|----------------------|---------|
| Built-in memory      | 4,096K  |
| Total memory         | 13,312K |
| System Software      | 1,577K  |
| Largest Unused Block | 7,319K  |

System Software added to Largest Unused Block equals 8,896K. This leaves 4,416K missing.

When I set the Macintosh to 32-bit mode, I see the following distribution of RAM:

|                      |         |
|----------------------|---------|
| Built-in memory      | 4,096K  |
| Total memory         | 13,312K |
| System Software      | 1,577K  |
| Largest Unused Block | 11,712K |

System Software plus Largest Unused Block equals 13,289K.

Why does there appear to be more memory available with 32-bit addressing turned on?

DISCUSSION -----

Virtual memory in 24-bit addressing mode fragments the memory available when you set the memory size to greater than 8MB. Virtual memory in 32-bit addressing doesn't face this limitation. The following examples show how

this happens.

#### 24-Bit Addressing

-----  
Setting your Macintosh to 24-bit addressing mode makes 16MB available to the computer. Here's what the memory map looks like in 24-bit mode:

| MB    | Function               |
|-------|------------------------|
| --    | -----                  |
| 1-8   | Physical & Virtual RAM |
| 9     | ROM                    |
| 10-15 | NuBus slots            |
| 16    | I/O                    |

When you set virtual memory greater than 8MB, the location of ROM in the memory map fragments the free memory. So the largest block available will always be 8MB minus memory any running applications use, until you exceed 8MB. After exceeding 8MB, the largest available blocks are the memory mapped into NuBus slot space.

The memory available to applications (application heap) includes the first 8 megabytes, plus any memory the NuBus cards (10-15) aren't using that has been mapped as memory by virtual memory. This is where the RAM available under virtual memory becomes fragmented. In the example of RAM distribution for 24-bit addressing, 11,735K of RAM is really available for the application heap even though the Largest Unused Block shows as only 7,319K.

#### 32-Bit Addressing

-----  
Setting the Macintosh to 32-bit mode prevents fragmenting available memory because it maps ROM and I/O to the top of the memory map. This makes 1GB available to the computer. Here's what the memory map looks like in 32-bit mode:

| Memory | Function               |
|--------|------------------------|
| -----  | -----                  |
| 1GB    | Physical & Virtual RAM |
| 256MB  | ROM                    |
| 2.5GB  | NuBus slots            |
| 256MB  | I/O                    |

Virtual memory in 32-bit mode only accesses the 1GB RAM memory space. This leaves the memory space between system heap and ROM available. The application heap is a contiguous block in the top thousand megabytes of the memory map. In the example for 32-bit addressing, the Largest Unused Block (11,712K) is equal to the total RAM available for the application heap.

HyperCard 1.2.5: Workaround for Sound Problems with System 6.0.7

=====

Article Created: 13 June 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I've read somewhere that HyperCard 1.2.5 doesn't run properly under System 6.0.7, especially when sound is involved.

System 6.0.7 is required for a Macintosh LC, so how can one resolve this problem without going to HyperCard 2.0 for the time being?

DISCUSSION -----

It's true. HyperCard 1.2.5 is not fully compatible with System 6.0.7. If you never "play" a sound, it works fine, but because Apple can't guarantee that sounds will never be played, the software is listed as "incompatible".

Claris suggests turning the volume all the way down; in effect, turning the sound off.

Here's another workaround for turning the sound down: add the following two handlers to Home's stack script:

```
on play
    --stops most play commands getting through to HyperCard, it's unlikely
    --that a stack would have used "send play ... to HyperCard".
end play

on beep -- flash the menu bar instead of beeping
    type space with commandkey
    type space with commandkey
end beep
```

PostScript: Displaying Output on Macintosh Screen

=====

Article Created: 13 June 1991  
Article Last Reviewed: 26 May 1992  
Article Last Updated: 26 May 1992

TOPIC -----

I want to create a PowerPoint presentation using a "screen shot" from a VAX workstation. I've made a PostScript file on the VAX that I downloaded to my Macintosh as a text file. On my Macintosh, the file shows up as a series of PostScript commands, as opposed to an image that the Macintosh can display properly.

Other than Display PostScript, do you know of any way to read in a PostScript file and have it displayed on-screen as it would appear on the printer? Is there a utility that would 'interpret' the PostScript file into a QuickDraw-generated screen display?

DISCUSSION -----

It is possible to display an EPS (Encapsulated PostScript) file with many Macintosh applications, including Adobe Illustrator.

To display full PostScript files under the Macintosh OS, use an application like LaserTalk from Emerald City Software or PostShow from Lincoln & Co.

It's possible that your PostScript files generated on the VAX wouldn't be well-behaved enough to work with PostShow. Extremely complex images can have problems. It also may not be worth it to buy this product for a one-time need. Many users duplicate the displays of non-Macintosh computers by hiring an artist to draw it using a Macintosh graphics program. The decision is usually based on how many times the conversion will be required.

## LaserWriter II: Intelligent Controller Box

Revised: 7/27/93  
Security: Everyone

LaserWriter II: Intelligent Controller Box

=====

Article Created: 13 June 1991

TOPIC -----

Is there an intelligent controller box for a LaserWriter II that allows both AppleTalk and serial communications without resetting the printer?

DISCUSSION -----

BridgePort, from Extended Systems, allows input from RS-232, parallel, and LocalTalk sources. Unfortunately, BridgePort only outputs via parallel or RS-232. This works with a LaserWriter, but does not take advantage of the LocalTalk port. You can use it with non-Apple PostScript printers that don't have a LocalTalk interface.

## Macintosh IIfx: Problems Using with UB MaxTalk

Revised: 7/15/92  
Security: Everyone

Macintosh IIfx: Problems Using with UB MaxTalk

=====

Article Created: 13 June 1991  
Article Last Reviewed: 14 July 1992  
Article Last Updated:

TOPIC -----

I am using Ungermann-Bass Access/One to connect Macintosh computers via the LocalTalk port to the UB MaxTalk card. Everything works fine with all Macintosh models except the Macintosh IIfx. The connection is weak or very slow.

I've installed the Serial Switch CDEV, and that solves the problem. My Macintosh computers are using only AppleShare Workstation software and System Software 6.0.7 to connect to the AppleShare server.

Some questions:

- 1) Have you heard of problems with the Macintosh IIfx and the UB MaxTalk Card?
- 2) Can you give me more details on the Serial Switch CDEV?
- 3) Is this an Apple problem or because the Ungermann-Bass product doesn't follow AppleTalk guidelines?

DISCUSSION -----

- 1) Ungermann-Bass Tech Support confirms the problem. They also state that using the Serial Switch CDEV solves the problem.
- 2) The Serial Switch CDEV for the Macintosh IIfx lets you bypass the IOP for the SCC chip, enabling compatibility with serial devices that don't work with the IOP. The I/O Processor (IOP) is an Apple custom IC designed to provide intelligent support for I/O controllers. There are two of these IOP chips in the Macintosh IIfx computer: one for the SWIM

and ADB and one for the SCC. The IOP sits between the main processor and the I/O controllers.

The features of the IOP include:

- A built-in microprocessor (6502 running at 2 MHz)
- A 17-bit timer
- Two DMA controllers: one for each serial I/O channel (only used in the Serial IOP)
- Address and data buses for RAM used by the IOP and host processor
- Two digital I/O ports for controlling the ADB (on the SWIM-ADB IOP)
- 32K of external memory of IOP code and data storage

The 68030 communicates with the IOP through a set of control registers in the IOP that are mapped into the main processor's I/O space. The main processor can interrupt the IOP using a bit in one of the control registers, whereas the IOP can interrupt the 68030 by using an interrupt line.

Each IOP has 32K of external RAM that holds the driver and acts as a buffer for the data processed by the processor. The IOP contains a 16-bit auto-incrementing address register and an 8-bit data port that the host processor uses for access to the shared RAM.

- 3) It's not AppleTalk guidelines that need to be followed, but serial port guidelines. The reason Apple put an SCC IOP in the Macintosh IIIfx was to handle the interaction with both serial ports. The SCC IOP handles LocalTalk to relieve the CPU from interrupts created by the LocalTalk transmission. Unfortunately, many applications accesses the SCC chips directly instead of the serial driver. Therefore, the Serial Switch CDEV was distributed for those applications to bypass the IOP.

We're not sure what the UB software does exactly and could not get the information from UB, but it is likely that they might be accessing SCC directly.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

X Window System for A/UX 2.1: Xt and Athena Widget Set

=====

Article Created: 23 August 1991

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

X Window System for A/UX 2.1 supports Xlib and the X Toolkit. Is the X Toolkit the same as the Xt toolkit? Does the X Toolkit include the MIT Athena Widget set? What makes up the MIT Athena Widget set, and what is its relationship to X Toolkit?

### DISCUSSION -----

The X Toolkit in X Window System 2.1 for A/UX is the standard toolkit from MIT known as the X Toolkit. The Xt is short for X Toolkit.

In order to better understand the components of X, here is a summary of each component:

- Xlib (/usr/lib/libX11.a)  
The standard C language library interface to X, which defines an extensive set of functions that provides complete access and control over the display, windows, and input devices such as mouse and keyboard.
- X Toolkit (/usr/lib/libXt.a)  
The high-level toolkits designed for use with X to build applications easily.

The X Toolkit consists of two parts:

- The Xt Intrinsics

Xt Intrinsics supports many different widget sets. Yes, X Window System 2.1 for A/UX supports the Athena Widget Set from MIT.

- The X Widgets set

The X Widgets set implements user interface components which include scroll bars, menu, and buttons. The Xt Intrinsics provides a framework that allows the programmer to combine these components to produce a complete user interface. The entire MIT Athena Widgets Set for X Window System 2.1 for A/UX has been built and kept in the /usr/lib/libXaw.a library. You can see all modules (Box, Form, Scrollbar, and so on) of the Widget set from the output of "ar-tv /usr/lib/libXaw.a".

Both the Xt Intrinsics and the X Widgets set are written in C and built on top of Xlib. In short, the X Toolkit includes a layer known as the Xt Intrinsics which defines an architecture for combining user interface components known as widgets to create an application user interface.

A/UX: Uses 7-bit Character Set for Filenames

=====

Article Created: 22 August 1991

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

Does A/UX 2.0.1 support an 8-bit or a 7-bit character set? I would have guessed 8-bit, but I've not been able to use special characters in filenames.

### DISCUSSION -----

ASCII is a 7-bit character set code with values ranging from 0 to 127. Binary data uses the 8-bit character set, with code values ranging from 0 to 255.

A/UX supports 8-bit binary files, which are usually executable applications and binary data files. A/UX 2.0.1 recognizes only 7-bit filenames, which means you can't create filenames with character values greater than 127. Special characters prohibited by 7-bit ASCII include '/', '|', and so on.

However, Macintosh HFS filenames can use the 8-bit character set.

The Stationery feature seems to have a counter-intuitive user interface. If I check both Stationery and Locked in a document's Get Info box, and then open the document, I get an untitled document with the contents of the selected Stationery document. Is this how it should work?

### DISCUSSION -----

Yes, this is how it should work. But the application must support Stationery for it to work correctly. If the application doesn't provide support, the Finder substitutes fundamental actions. What you see are the Finder actions taken in the absence of Stationery support from the application.

When you double-click a Stationery Pad in the Finder, you open a copy of the document. If a document is marked as Stationery, the Finder checks the application to see if it supports Stationery. If the application doesn't support Stationery, the Finder creates a new document from the template and prompts you for a name. The Finder then makes a copy of the document and displays the copy dialog.

When you open a Stationery document from an application that doesn't support Stationery, an alert box warns that you are opening the Stationery Pad itself, not a copy of it. Opened from the application, you make changes to the Stationery document as if it were an ordinary

document. It is possible in such a case to change a Stationery document even when you didn't intend to alter the template.

If the application supports Stationery, the Finder won't perform auxiliary actions. The application takes responsibility for what happens. The specifications for Stationery support require that the application copy the template's contents into a new document and open the document in an untitled window.

Grimes Security Kit: Macintosh LC Requires Two Loops

=====

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Here in Sweden, we sell a Grimes Universal Security Kit. It's supposed to fit all Macintosh computers, but it doesn't cover both the Macintosh LC and its keyboard because the kit includes only one loop. Can we get a second loop separately?

DISCUSSION -----

Grimes is in the process of repackaging their security product. The current kit contains one keyboard loop. To use the product on a Macintosh LC, you need two loops. Contact Grimes for additional loops.

You can find the address and phone number for Grimes, Inc. in a separate article in the Tech Info Library.

Macintosh Display Cards: Identifying PAL-Compatible Versions

=====

Article Created: 15 August 1991  
Article Last Reviewed: 12 June 1992  
Article Last Updated:

TOPIC -----

There are PAL versions for the Macintosh Display Cards. The label appends "/A" for NTSC, and "/B" for the PAL version.

Is there a visible difference on the card to identify the PAL version?

DISCUSSION -----

The Macintosh Display Card 8•24 GC (M0122LL/C) has always had PAL capability. The current ROM version is 1.1.

On the other cards, there is no visible difference (8•24 M0507PA/B; 4•8 M0121PA/B). The only change is a ROM revision.

Apple introduced a new ROM for the Macintosh Display Cards 4•8 and 8•24 in July. The card uses sense-pin combinations to determine NTSC or PAL. We ship all new cards with this ROM (version 1.2, part number 341-0868). You can get upgrades for older cards (fee involved; see the August Service Mailing).

| Desktop                    |         | < 42 dB              |
| Macintosh Portable         |         | < 51 db              |
| Macintosh PowerBook Family |         | See Notes            |

#### Notes

-----

\*The floppy disk drives were not reading a disk during the "floppy system" tests; the hard drives were spinning and seeking during the "hard disk system" tests.

\*\*The hard drive noise levels vary within the same model from the same company and may result in slightly different results than that reported above.

When we use drives from a manufacturer not listed above, our desire is to keep the overall noise level emitted by Macintosh SEs or Macintosh SE/30s containing those drives at or below 40-41db.

\*\*\*The test results for the Macintosh SE with the updated fan apply equally to a Macintosh SE with 800K drives or SuperDrives -- they use the same fan. The noise level was not checked with the drives

reading or writing to a disk.

The noise levels in the Macintosh IIfx will vary since it uses a variable speed fan:

| Macintosh IIfx configuration | db   |
|------------------------------|------|
| -----                        | --   |
| 1 NuBus card                 | 39   |
| 1 NB card/1 internal HD      | 42.5 |
| 6 NuBus cards                | 42.5 |
| 6 NuBus cards/1 internal HD  | 44   |

PowerBook computers are noise free except for floppy or hard disk use.

#### Article Change History:

02 Aug 1996 - Added CLW 12/600 and LW 12/640.

31 Aug 1995 - Added LaserWriter 4/600 and 16/600 noise specifications.

03 Jan 1995 - Removed speed ratings from Power Macintosh models.

Security: Everyone

Printing PostScript From a PC

=====  
Article Created: 13 August 1991  
Article Last Reviewed: 26 May 1992  
Article Last Updated:

TOPIC -----

I need to print, on an Apple LaserWriter, some Macintosh PostScript files that were transferred to an IBM. Do you know of any programs for the PC that can send a PostScript file to a PostScript printer (similar to SendPS on the Macintosh)?

DISCUSSION -----

The nature of connections between PCs and printers eliminates the need for a SendPS type of utility. On a Macintosh, SendPS sets up a PAP session with a LaserWriter and downloads the specified file. With a PC, the LaserWriter connects to one of the serial ports directly, or via a network card that allows mapping of COM or LPT ports to the LaserWriter. In either case, you can COPY a desired file to the port to print it.

Assuming your LaserWriter is connected serially, these are the required steps:

- 1) Set up the COM port with the MODE command. Typical settings are 8 data bits, 1 stop bit, and no parity.
- 2) With these settings, and assuming the use of COM1, the command looks like this:

```
MODE COM1:9600,n,8,1,p
```

Note that you execute this command only once each time you start the computer. Because the settings remain until the next startup, this command is frequently placed in the AUTOEXEC.BAT file.

## ..TIL08557-Printing\_PostScript\_From\_a\_PC.pdf

3) To print a PostScript file to the LaserWriter, use the COPY command:

```
COPY myfile.ps COM1
```

## Improving Server Performance

Revised: 9/12/91  
Security: Everyone

Improving Server Performance

=====

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Which makes more sense to increase network performance when getting files from the hard drive of a file server?

- Upgrade the server to a faster CPU? (e.g. from a Macintosh II to IIfx)
- Add SCSI Cards to speed up performance of the disk drive?

DISCUSSION -----

It depends on what part of the system is currently the bottleneck and how much you want to spend. Since the target is the CPU and I/O, we assume you're already using EtherTalk and not LocalTalk. This is the most obvious first step to improve performance.

The next step depends on what the most important application is on the server. Upgrading the CPU from a Macintosh II to a Macintosh IIfx can help a number of server operations a little, but it won't make dramatic differences. If a high percentage of the server's time is spent waiting for the disk drive to complete seek operations (such as with multi-user database applications), then speeding up this waiting won't do much good, and you should consider a higher performance disk drive. This may consist of a disk drive with faster seeks and throughput, but could also be a caching SCSI card such as the DayStar SCSI PowerCard with several megabytes of cache RAM. Each contributes unique advantages.

A combination of all of these upgrades would give the highest performance improvement. Since we haven't performed any benchmarks on this subject, we can't provide you with real numbers for comparison. Our recommendation is to obtain a caching SCSI card for evaluation and decide if it provides

the necessary performance improvements.

## Mactivity 1991: Jim Groff's Keynote Address

Revised: 9/12/91  
Security: Everyone

Mactivity 1991: Jim Groff's Keynote Address

=====  
Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

This article summarizes the Mactivity keynote address titled "Macintosh Connectivity: Perspective and Directions" delivered by Jim Groff, Director of Marketing, Enterprise Systems Division.

DISCUSSION -----

Jim opened with a brief review of 1991 so far:

- Apple Ethernet cabling system
- AppleTalk and DAL licensing programs
- The formation of ESD to address large organizations' needs
- System 7.0 with file sharing and IAC
- Additional developments in the Apple/DEC alliance such as Desktop ACMS
- The introduction of Mac SNA•ps
- The recently announced letter of intent with IBM

Next, he reviewed the roots of the business from Apple's perspective--  
PERSONAL computing.

In reality, there are two sets of expectations forming around personal computers, the end-users, and IS. End-users say "I want connection to my organization and my organization's data." IS says "I want a graphic delivery platform for existing host applications, and I want more, cheaper MIPS." Jim noted that these expectations in today's organizations were either overlapping or colliding, depending on your point of reference.

Thus, Apple believes that personal computing is splitting into two businesses: individual personal computing (where miniaturization and mobility are the keywords), and enterprise personal computing (where

standards and control are key).

Broadly speaking, Apple's N&C goals are:

- To address a wide range of users' needs (from very small and mobile, to plug and play LAN, to enterprise-wide).
- To provide the best user experience.
- To build architectures and core products.
- To enable and evangelize network application development.

Jim made a specific point of the "architectures" issue versus products. In reference to the whole, he said "We can't do this all ourselves; no one vendor can."

Next, Jim outlined our four major areas of N&C investment:

#### 1) AppleTalk Network System

Is a benchmark for Macintosh network experience.  
Is the de facto standard.

- Directions:
  - New and enhanced AppleTalk services
  - AT network management
  - Remote network access
- AT services in a "standards" context:
  - "Standards" context includes both OS and net protocol issues. Aggressive AppleTalk licensing.
  - Cross platform integration is a key goal of this program.
  - Macintosh, DOS, Windows, VAX, UNIX, Novell, DEC.
  - LANManager is a key goal.
- Both client/server and peer-to-peer architecture support:
  - A/UX will have a strong role in future client/server architectures.

#### 2) Macintosh in Enterprise-Wide Computing

Four platforms: IBM, Digital, TCP/IP, OSI

- Apple/DEC:
  - No backing away from this relationship is implied in the IBM announcement.
  - PATHWORKS as core product.
  - Highlight DEC's announcement of Desktop ACMS (an on-line transaction processing tool) with strong System 7.0 DAM support.
- Apple/IBM:

- Letter of intent.
- One key goal is to bust myths (only one part of wide ranging goals).  
that Macintosh is a toy.  
that Macintosh can't connect.  
that Macintosh isn't a standard.
- There will be products from Apple, IBM, and ISVs.
- Apple/TCP/IP:
  - Foundation is MacTCP.
  - X, net management are development directions.
  - Customer asked about ship date for MacTCP under System 7. Jim responded "It's on a schedule."
- Apple/OSI:
  - X.25 today.
  - X.400, X.500, X transports, X net management are "areas of significant investment."

### 3) Standards-Based Systems and Networking

- Many very tough issues from customers in this area:
  - Cross platform development
  - Network and systems management
  - Multi-vendor networking
- Both OS and net protocol issue: UNIX, TCP/IP and OSI
- Customers want standards without compromising user experience!
  - It must look like a Macintosh and act like a Macintosh.
  - It must walk, talk, and smell like a standard.
- The problem is that today's standards are "heavy on the plumbing" and "light on the services," whereas today's Macintosh and AT are so much heavier on the services.
- Investing very heavily in this area with A/UX gives the best of Macintosh plus the best of open systems.
- This will also be an area of joint development with IBM.

### 4) Client/Server Tools and Target Applications

- Jim positioned existing products like MacX, MacWorkStation, DAL, APPC on a standard graph showing terminal emulation, front-ending, database access, and full cooperative processing.
- When asked during Q&A "Will Apple step to the client server model fully with a diskless Macintosh and a server to support it?" Jim answered "You will see Apple step up much more strongly to the

client-server proposition in the future, as the relationship with  
IBM moves from letter of intent to contract."

Cellular Modems from Cellabs

=====  
  
Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I would like to use my Macintosh Portable with a cellular phone in the car to access the network in the office. Any ideas?

DISCUSSION -----

Cellabs makes two products that allow you to access your office network using a cellular phone. Both products tie into an existing cellular phone between the handset and base unit.

- One product is Cellmodem 2400. If you don't have a modem, Cellmodem 2400 can provide both 2400 baud modem and Datajack capabilities in one unit.
- Another product, Datajack, allows a cellular phone to work with any internal/external modem you already have.

You can find the address and phone number for Cellabs in a separate article in the Tech Info Library.

Security: Everyone

MacX Server and X Client Source Code

=====

Article Created: 20 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Is there any way to take the source code of an X application and move it to a Macintosh so that the client piece as well as the server piece both will run on the Macintosh?

I know I can run MacX to another X client, but the X client does most of the processing. I want the Macintosh to do all of the processing.

DISCUSSION -----

No, currently there is no way you can take the X client source code compiled under Macintosh OS and run with the MacX server under Macintosh OS. No X11 library and Xt intrinsics are available for Macintosh OS, and there is no way to compile the X client under Macintosh OS. Only the MacX "server" environment is supported under Macintosh OS.

## Macintosh Monitors: Compatibility with MS-DOS PCs (12/95)

Revised: 12/15/95  
Security: Everyone

Macintosh Monitors: Compatibility with MS-DOS PCs (12/95)

Article Created: 21 August 1991  
Article Reviewed/Updated: 15 December 1995

TOPIC -----

Can a Macintosh monitor be used on a MS-DOS personal computer? I have the pinouts for the Macintosh monitors. If I made a special cable to meet the pinout specifications, could it be done?

DISCUSSION -----

It is unlikely that any video card for MS-DOS computers would work with Apple displays other than the Apple Multiple Scan displays or those that support a VGA output.

The video cards for MS-DOS computers have different timing than the Apple video cards. With the exception of Multiple Scan displays, Apple monitors are locked into a specific scan rate, which matches the Apple video cards, and cannot be changed.

Many third-party monitors adapt to a variety of scan rates, just like Apple's Multiple Scan displays. We do not have a reference list of third-party monitors that are Macintosh and MS-DOS compatible. Contact the monitor manufacturer to determine a monitor's ability to work in both environments. Generally, monitors used with MS-DOS computers are known as EGA-, VGA-, CGA- (or similar "xGA-") compatible.

## Macintosh Access to Btrieve on Netware

Revised: 9/19/91  
Security: Everyone

Macintosh Access to Btrieve on Netware

=====

Article Created: 15 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

We have a Novell network (currently upgrading to 3.11) using SoftPC, MagicPC and Btrieve. We would like to use applications that are resident on the Novell server. What can we use to access Btrieve files created in DOS format from a Macintosh? Can we run applications? Will there be a performance penalty?

DISCUSSION -----

Accessing Btrieve files from a Macintosh workstation cannot be done directly from the Macintosh OS as we don't know of an implementation of Btrieve that is Macintosh OS compatible. There are other B-tree library solutions like c-tree Plus from FairCom, but they are not file-compatible with Btrieve. There are, however, several solutions for executing DOS programs on a Macintosh, and these could be those same Btrieve-based applications used on the PCs.

The classic solutions for executing DOS applications on a Macintosh are SoftPC (from Insignia Solutions, Inc.) or a DOS coprocessor card. The coprocessor cards, such as the Orange Micro Mac286 or Mac386, are PCs on a card that plug into a Macintosh and are accessed via a Macintosh program. These hardware solutions tend to be faster, but are also much more expensive.

A third and more recent solution is Novell's Netware Access Server. This product installs on the Netware server and allows up to 16 simultaneous virtual DOS sessions to be distributed over the network to workstations. The workstations run client software that provides the DOS session in a Macintosh window. Since you already have a Netware server installed, this might be the way to go.

Performance of each solution depends on the application. The Mac386 card is likely to give the best performance, but this isn't very cost effective if a number of users need them. The performance potential of the Novell solution is good, especially if the Btrieve files are located on the Netware server with the DOS session server. The only network traffic is for user input and screen updates. With a database application, this may even outperform the DOS coprocessor cards.

We recommend that you first try the PC applications with SoftPC, since you already have that. If the performance isn't to your liking, you may wish to try another solution. Either way, it sounds like you're already very close.

On AppleLink, you can find contact information for the various vendors by clicking the Tech Info Library's 'Library Index' button to view the folder structure. An alphabetic listing of vendors is in the Third Party Company Directory folder.

## SNA•ps: 510 Error on SDL\_C Connection

Revised: 10/14/92  
Security: Everyone

SNA•ps: 510 Error on SDL\_C Connection

Article Created: 20 August 1991

### Article Change History

-----  
10/15/92 - REVIEWED  
• Reviewed for technical accuracy.

### TOPIC -----

I'm trying to get an SDL\_C connection from the SNA•ps Gateway across an Apple Serial NuBus card. The 3270 Emulator instantly put up a 510 error on connect, and the Message log from SNA•ps Admin indicated a successful connection to Host 01.

The Mainframe people at the remote host site got nothing at all on their FEP port. Communications attached a breakout box to the line and said that the Clear to Send line was held low (although I don't believe that was coming from the Serial card).

Should I use port 2 (A or B) on the Hydra cable instead of Port 1A?  
Can you confirm whether this is the problem?

### DISCUSSION -----

As you might already know, the Apple Serial NB cards, as shipped, are configured with ports 1A and 1B as high-speed V.35/RS-422 types of ports, and ports 2A and 2B as low-speed RS-232-C ports. If you plan to use port 1A or 1B also as RS-232-C ports, you have to remove two small components, called R-paks, from the card. Refer to the Apple Serial NB Card Installation Guide for the location of these R-paks. If you use the V.35 modems, you can use port 1A. Otherwise you need to select ports 2A or 2B in the SDL\_C Line Screen. See if the R-paks were removed from your card, and/or configure the ports correctly, and try again.

## Ethernet NB Card and DECnet INIT (11/94)

Revised: 11/10/94  
Security: Everyone

Ethernet NB Card and DECnet INIT (11/94)

Article Created: 20 August 1991  
Article Reviewed/Updated: 10 November 1994

TOPIC -----

In testing the Apple Ethernet NB Card with PATHWORKS to load the DECnet INIT, the system crashes with a bus error. Is a fix available?

DISCUSSION -----

We were able to load DECnet for Macintosh 1.0, and use NetCopy to transfer files from a VAX to our Macintosh without any problems. We also used DECnet for Macintosh 1.1 EFT1 and that also worked fine.

We used a Macintosh IIx, running system software 6.0.5, 4MB RAM, and DECnet for Macintosh 1.0. Our EtherTalk software was installed from the EtherTalk Installer version 2.5.1 that came with the Apple Ethernet NB Card. The other EtherTalk components and versions are EtherTalk Prep 1.0, EtherTalk Phase 2 version 2.2.2, and A/ROSE 1.1.4.

To troubleshoot further, answer these questions:

- Did this happen on every system? Could you try other systems?
- What is the hardware configuration of the Macintosh?
- What are the system software and network software versions?
- Did you try on more than one Apple Ethernet NB card?
- Do you have any INIT or CDEV, which might conflict with Apple software or DECnet software? We suggest trying with a clean system.

## TokenTalk NB Card: SNA•ps and AS/400 Compatibility

Revised: 7/27/93  
Security: Everyone

TokenTalk NB Card: SNA•ps and AS/400 Compatibility

Article Created: 21 August 1991  
Article Reviewed/Updated: 23 July 1993

TOPIC -----

Is the TokenTalk NB card compatible with AS/400? Will SNA•ps work with it?

DISCUSSION -----

You can configure the AS/400 with an optional token ring communications subsystem. Each token ring adapter card supports up to 254 devices on the ring. A Macintosh with an Apple TokenTalk NB Card can connect to a token ring LAN and to the AS/400.

A Macintosh running TokenTalk can also communicate with an AS/400 using a product that supports distributed sessions over AppleTalk networks. An example of this is NetAxxess from Andrew Systems.

SNA•ps is fully compatible with the Apple TokenTalk NB Card. In fact, a Macintosh with an Apple TokenTalk NB card can run as a SNA•ps APPC Gateway. Legent Corporation (formerly by Spectrum Concepts) and Andrew Systems developed products to take advantage of this SNA•ps APPC Gateway. MacXCOM 6.2 from Spectrum Concepts is fully compatible with SNA•ps APPC API and provides Macintosh users with File Transfer, Remote AS/400 Job entry, and a Report Writer. TokenAxxess from Andrew Systems allows a Macintosh in a token ring to access the AS/400 as a 5250 workstation.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

### Article Change History

23 July 1993 - Company title changed from Spectrum Concepts to Legent Corp.  
9 February 1993 - Updated, spectrum Concepts acquired by Legent Corporation.

## SNA•ps: Third Party Token Ring Cards and Routers (11/94)

Revised: 11/10/94  
Security: Everyone

SNA•ps: Third Party Token Ring Cards and Routers (11/94)

Article Created: 20 August 1991  
Article Reviewed/Updated: 10 November 1994

TOPIC -----

- 1) I just want to verify that the SNA•ps client piece will run with third-party token ring cards.
- 2) When running SNA•ps Gateway (on an Apple token ring card), are there any issues related to accessing mainframes across routers such as cisco?

DISCUSSION -----

- 1) SNA•ps Gateway requires Apple Token Ring cards. It doesn't support third-party Token Ring cards. SNA•ps Gateway communicates with distributed Macintosh computers via ADSP, so the distributed Macintosh computers can have third-party Token Ring cards as long as they are TokenTalk compatible.
- 2) The Cisco router provides both AppleTalk routing and source routing bridging, so it should work with SNA•ps running either as a gateway or distributed SNA•ps 3270 on AppleTalk (LocalTalk, EtherTalk, and TokenTalk) networks.

To locate a vendor's address and phone number, use the vendor's name as a search string in the Tech Info Library.

## DAL Server for MVS/VTAM

Revised: 6/29/92  
Security: Everyone

DAL Server for MVS/VTAM

=====

Article Created: 20 August 1991  
Article Last Reviewed: 29 June 1992  
Article Last Updated: 29 June 1992

TOPIC -----

I'm about to purchase DAL for VTAM. Is the following information correct?

- 1) TCP/IP is not currently supported.
- 2) SNA support is available via Netway 2000, Avatar, and MacIrma, but not via SNA•ps.
- 3) There are no extra pieces needed on the IBM (in addition to DAL). I have experience with a few other products that require LU6.2. DAL for VTAM does not require LU6.2. DAL for VTAM doesn't run under CICS.

DISCUSSION -----

- 1) This is correct. DAL 1.3 only supports MacTCP connection to IBM host systems running VM.
- 2) The following connections are available using the 3270 display station (LU2) communications protocols:
  - MacDFT Coax/Twinax, TokenTalk NB Card, or Serial NB Card
  - Netway 1000/2000
  - MacMainFrame
  - MacIrma

Additionally, with SNA•ps, you can define a connection using the APPC display station (LU6.2) communications protocol. Use this connection if your Macintosh connects to an IBM mainframe through a LocalTalk or Ethernet network which has access to a SNA•ps 1.0.1 gateway.

3) Correct. CICS 1.7 or later is optional, and is required only if you are using the CICS Passthru program to access the VTAM server.

## MacLANConnect: DOS Systems as AppleShare File Servers (11/94)

Revised: 2/9/95  
Security: Everyone

MacLANConnect: DOS Systems as AppleShare File Servers (11/94)

=====

Article Created: 20 August 1991  
Article Reviewed/Updated: 10 November 1994

TOPIC -----

I need to access the LAN Manager servers as AFP volumes from the Macintosh computers using Ethernet. I'm aware of Miramar's MacLANConnect, but I have a couple of questions:

- 1) Is the MacLAN Gateway what I really want, or are there better solutions?
- 2) Does the MacLAN Gateway do the routing between Token Ring and Ethernet, or do I need to use a router to change to Ethernet?

DISCUSSION -----

- 1) Currently MacLANConnect is still your only solution to turn a DOS computer into an AppleShare File Server. Microsoft announced that it will incorporate the 3Com technology to allow direct Macintosh access to LAN Manager, but that is not available.
- 2) MacLANConnect is a File and Print server software. It does not perform any routing. You still need a router for this function.

To locate a vendor's address and phone number, use the vendor's name as a search string in the Tech Info Library.

## MacX Over DECnet without PATHWORKS (1/95)

Revised: 1/30/95  
Security: Everyone

MacX Over DECnet without PATHWORKS (1/95)

Article Created: 20 August 1991  
Article Reviewed/Updated: 30 January 1995

TOPIC -----

I want to run MacX on a Macintosh IIci (with Ethernet board) to a VAXstation using the DECnet protocol. Is there a software package to get the DECnet services? I know that I can use MacX with PATHWORKS to run DECnet, but I'm not sure if DEC wrote specialized software. In my case, buying PATHWORKS is not an option.

DISCUSSION -----

Since you aren't buying PATHWORKS for Macintosh, you need to get DECnet software called TSSnet from Thursby Software (Alisa also sells this Thursby TSSnet package). The VAXstation should be running DECnet, which comes with VAX/VMS. You miss the following two things by doing it this way:

- PATHWORKS includes DECwindows fonts that you will need when you run DECwindows clients. If you buy MacX from Apple, you won't get these fonts.
- PATHWORKS provides a DECnet object called MSAX\$CLIENT, which allows automatic execution of DECwindows clients from the remote Macintosh running MacX server. Without this DECnet object (which does not come with standard DECnet), you must:
  - Log on to the VAX using a terminal emulator.
  - Define a DECwindows display using the DCL SET DISPLAY command.
  - Use RUN/DETACH or SPAWN to execute the DECwindows client.

## DAL: Out-of-memory Error Due to Application's List of Tables

Revised: 6/29/92  
Security: Everyone

DAL: Out-of-memory Error Due to Application's List of Tables

=====

Article Created: 21 August 1991  
Article Last Reviewed: 29 June 1992  
Article Last Updated:

TOPIC -----

I'm evaluating DAL on an IBM 3090. I would like to hard code the name of a specific table within a query. Is there a way to avoid maintaining a list of tables in memory that causes an out-of-memory error due to the large list of tables available?

I've been able to use the Excel add-in to do the following tasks:

- Connect to the mainframe
- Access the DAL server
- Open sqlds
- Open the iu database

At this point, the Excel data access add-in appears to be creating a local copy of information about all the tables within the iu database on the mainframe. Why is this necessary? Since the combination of the system, the Finder, and Excel use up about 3.4MB of the 4MB available on our Macintosh IIci 4/80, I get an out-of-memory message box with an OK button.

ClearAccess actually does the same sort of thing. When creating a new query, it fills one component of the query-building window with a scroll box containing all the tables that I have in my view of the iu database. Since I'm running only a desk accessory, there is enough memory for this to happen.

DISCUSSION -----

DAL engineering confirmed that this is an application implementation problem, not a DAL problem. DAL doesn't require a list of tables

kept locally on the workstation.

We recommend that you discuss this issue with the application vendors.

You can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

## Ethernet and Routers versus LocalTalk Bridges

Revised: 9/20/91  
Security: Everyone

Ethernet and Routers versus LocalTalk Bridges

Article Created: 20 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I am looking for some network performance information. Specifically, I need to know what the performance advantages are for putting in Ethernet and routers versus LocalTalk bridges to extend a network beyond the standard LocalTalk limitations. My network is in a publishing environment that deals with many large color graphics and images.

The nodes are all Macintosh II series, mostly high-end systems. They are scattered over a number of different floors in a building. I have 48 nodes now, and expect that number to grow significantly.

DISCUSSION -----

It's difficult to make specific statements about the viability of LocalTalk over Ethernet or Ethernet over LocalTalk without knowing more about the customer's environment. Two important factors to consider are the number of potential users on the network, and the actual type of work they do over the network (that is, file sharing, mail, database, and so on). It's not too difficult to come up with a few graphs to show the difference between LocalTalk and Ethernet transfer rates, but it really doesn't tell the whole story or justify the expense of moving to Ethernet.

LocalTalk uses CSMA/CA and Ethernet uses CSMA/CD. A certain amount of overhead is associated with CSMA/CA which is not needed in a CSMA/CD (Ethernet) environment. The bandwidth of a LocalTalk network can be dominated by a single node doing a single file transfer. Ethernet has plenty of bandwidth available, which makes domination by a single node almost impossible. On the other hand, LocalTalk is basically free and Ethernet requires a significant investment in hardware.

Ethernet is definitely the best choice for anyone contemplating large numbers of users accessing a shared resource and/or anyone who may have significant data transfer requirements. It sounds like you fit this description. Remember that networks usually grow larger and more complex. With more demanding network-based applications predicted for the future, LocalTalk may be a viable topology only for small workgroups that only transfer an occasional file and/or read mail.

## AppleTalk Over X.25 (8/93)

Revised: 8/9/93  
Security: Everyone

AppleTalk Over X.25 (8/93)

=====  
Article Created: 20 August 1991  
Article Reviewed/Updated: 6 August 1993

TOPIC -----

Is it possible to connect two AppleTalk networks using X.25 and two half-routers (like a Shiva TeleBridge)? I understand that this would be much slower than pure LocalTalk, but it might be a nice alternative to a 9600-baud NetModem.

DISCUSSION -----

With the Apple Internet Router 3.0 Wide Area Extension options, you can connect geographically remote workgroups using wide-area telecommunications links. The AppleTalk/X.25 Wide Area Extension (available separately) enables two or more AppleTalk networks to communicate through an X.25 communications link. This wide area extension includes:

- Offers a wide variety of X.25 parameter settings, enabling you to implement the most effective X.25 service.
- Provides a set of standard profiles for the major public packet-switched networks worldwide.
- Allows you to create your own customized profiles for any public or private data network.

Apple's X.25 product, MacX25, can't route AppleTalk over a packet-switched network. You can also explore third-party solutions. Keep in mind that the PDN (Packet Data Network) provider's charges are based on, among other things, the size and number of packets.

One AppleTalk X.25 WAN routing scheme is from Access Privilege, a company in France. Their product named "The Link" is based on the CommToolBox and works with the Apple Internet Router. It provides routing over a variety of links including X.25, and eventually ISDN.

One of the more commonly used AppleTalk tunneling solutions comes from DEC. GatorBox and cisco offer good solutions.

In general, Apple does not control how third parties choose to implement routers and other such products based around AppleTalk. With every solution, we recommend you check with the supplier to find whether their product serves your needs. It's a good idea to request testimonies and account referrals.

The rest of this article lists third-party router manufacturers who can route AppleTalk over X.25.

Ungermann-Bass, Inc.

-----  
A remote router and software for an AppleTalk hub work with the company's Access/One multiprotocol hub system. The ASM 8320 plugs into the same multiprotocol hub as the company's MaxTalk--a 16-port, twisted-pair AppleTalk hub--to connect physically separated networks over several kinds of media. The router connects sites over standard serial lines, 56-Kbps leased lines, high-speed T-1 lines, or X.25 packet-switched networks at data transfer rates of up to 2.05MBps.

The two-port version with router software can route packets locally between AppleTalk networks using any combination of LocalTalk, Ethernet or Token Ring. A separate DOS-based management program lets users configure the router to filter and restrict traffic according to protocol type, port number, or source or destination address. Managers also can identify high-priority packets from a particular address or of a certain type that the router will forward immediately.

New MaxTalk software adds AppleTalk Phase 2 support as well as Phase 1-to-Phase 2 routing to the company's combination AppleTalk hub and TCP/IP gateway. Improved security lets network administrators control access to printers and file servers.

cisco Systems, Inc.

-----  
Like other cisco routers, the AGS+ routes a number of protocols, including TCP/IP, DECnet, OSI, XNS, Apollo Domain, Novell IPX, Banyan VINES, 3Com 3+Open, Ungermann-Bass Net/One, X.25, DDN X.25, and AppleTalk. Optional concurrent bridging and source-route bridging are available to handle non-routable protocols such as DEC's LAT and IBM's SNA and NetBIOS. It also supports multiple routing protocols (RIP, IGRP, BGP, EGP, RTMP) and the Simple Network Management Protocol (SNMP) for remote network monitoring.

Proteon Corp

-----  
Proteon Corp offers the ProNet CNX series of RISC-based communications routers. The ProNet CNX series uses a special multiport shared-memory architecture and AMD's (Advanced Micro Devices) 29000 RISC processor. The CNX 500, the first in the series, runs at 25,000 packets per second. The

router is intended for IBM SNA/multiple-protocol environments, particularly for work groups needing to move from 16M-bps token ring backbones to 100M-bps Fiber Distributed Data Interface (FDDI) backbones. The device routes IBM-environment messages into IPX (Novell Netware), OSI, DECnet, AppleTalk, XNS, and TCP/IP protocol stacks; it supports T1/E1 lines, X.25, and frame-relay fast-packet switching for WANs.

#### NCR Comten

-----  
Mainframe vendor NCR Comten sells a line of intelligent communications servers, the Open Network System (ONS), that function as a freestanding OSI-based backbone for large heterogeneous environments. ONS integrates mixed systems to reduce the amount of interconnecting equipment. It allows growth and control of enterprise-wide computing by offering a configurable and scalable system that is built on industry standards: Intel Corp. processors, MicroChannel bus, SCSI connection, and the UNIX System V operating system.

ONS offers concurrent bridging and routing capabilities. It supports AppleTalk, NetBIOS, Netware IPX, OSI, SNA, TCP/IP, and 3Com 3+ XNS protocols. It supports the RS-232 and RS-422 serial, T1, X.25, and SDLC WAN interfaces. It also supports Stp and token ring source-routing.

#### BBN Communications

-----  
BBN Communications markets the T/200 IPR as part of its internetwork product portfolio. The T/200 is a multi-protocol, multi-media router that supports such protocols as TCP/IP, DECnet, XNS, IPX, AppleTalk, and X.25 in addition to Spanning Tree bridging. The T/20 and T/200 IPRs are a family of products which can be used in the same network or internetwork.

#### AT&T Computer Systems

-----  
AT&T Computer Systems enhanced its Datakit II Virtual Circuit Switch line by adding token ring support, support for AppleTalk networks, and by including access to multiple hosts. Release 2.0 of the product includes the capacity to relay switch, two-way communication between Datakit terminals and X.25 hosts on public and private packet networks. Disk storage was increased to include support of a 40MB SCSI hard disk and tape subsystem. Current users of the product can upgrade. An optional offering is the Maintenance and Redundancy Control Module, an interface which lets you switch the unit from a primary network to a backup.

To locate a vendor's address and phone number, use the vendor name as a search string.

## Macintosh: Wyse 60 Terminal Emulation

Revised: 9/20/91  
Security: Everyone

Macintosh: Wyse 60 Terminal Emulation

=====  
Article Created: 21 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I am currently using Motorola Models 3640 and 3840 mid-range computers. The PCs connected to them use a Wyse 60 terminal emulation package from Motorola. Motorola offers no support for the Macintosh. They also provide file server/printer server access for PCs, but not for Macintosh computers. I understand that Motorola bought Pacer software technologies to provide these services on the Macintosh.

I need to locate a vendor that offers the Wyse 60 tool to use with PacerTerm for Macintosh terminal emulation.

DISCUSSION -----

We are not aware of an available Wyse 60 tool that PacerTerm could support. Here are two alternatives:

- Wyse 60 Support within the PacerLink Software

PacerLink software (which is available now to OIR as a preferred customer) doesn't support Wyse 60 directly. Pacer engineers told us that many customers use the ADDS 60 option in place of Wyse 60, but it doesn't work in all instances. It's definitely worth trying.

- A Different Terminal Emulation Package that Supports Wyse 60

We realize that this may not be an alternative in your environment, but you may want to consider a different terminal emulation package which does support Wyse 60. Investigate Term from Century Software or MacEmulate from TLC.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

## Token Ring: 16MBps Over Synoptics UTP

Revised: 2/11/93  
Security: Everyone

Token Ring: 16MBps Over Synoptics UTP

Article Created: 12 August 1991

### Article Change History

02/09/93 - UPDATED

- h-athree Systems, Corp. now Asante Technologies, Inc.

### TOPIC -----

Is there a solution for connecting our Macintosh II series to a 16MBps Token Ring to an IBM system? We have a Synoptics Model 3000 concentrator (Lattisnet) on unshielded twisted pair, and we would like to connect our Macintosh computers to this Token Ring to do 3270 terminal emulation and DFT.

### DISCUSSION -----

Synoptics confirmed that its Model 300 Concentrator supports 16MBps Token Ring. You will need the UTP (Unshielded Twisted Pair) Token Ring Host Module model 3505.

On the Macintosh, you need one of the following Token Ring adapters:

- Tri-Data LanWay 16/4 Family: This is a 16/4 Token Ring (IEEE 802.5) LAN option that consists of two adapters--one for the Macintosh SE/30, and one for the Macintosh II family. Equipped with the Texas Instruments TMS380C16 Token Ring Processor, the LanWay Token Ring card can operate at both 16MBps and 4MBps in a single adapter. Software switches the card between the two speeds. For high-performance operations, Tri-Data Systems provides 128K of onboard RAM for multiple transmit and receive operations. The board is TokenTalk compatible, so all AppleTalk LAN operations are compatible with the cards.
- Asante Technologies (formerly h-three Systems, Corp.) MacRing NB 16/4: This

is an expansion card (with firmware and software) that connects Macintosh II computers to 16MBps or 4MBps Token Ring networks. The card's speed is hardware- or software-selectable. MacRing NB 16/4 supports third-party software for 3270 connectivity to IBM mainframes and 5250 connectivity to IBM midrange systems over Token Ring networks. It supports AppleTalk Phase 2, IEEE 802.2 LLC (Types 1 and 2) and IEEE 802.5 Token Ring protocols. It supports the Apple LLC IPC interface and IBM source routing. The package consists of the MacRing NB 16/4 expansion card, software, and downloadable firmware on a 3.5-inch disk, a user's guide and a one-year warranty.

You will also need a 4/15MB Medial Filter, such as those offered by Black Box. The media filter connects the Macintosh computers to the MAUs or the Synoptics Token Ring Host Module. It converts the Macintosh's DB-9 connector to a twisted-pair RJ-45 connection.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

## System 7: Installing LaserWriter Drivers to Work with System 6

Revised: 5/11/92  
Security: Everyone

System 7: Installing LaserWriter Drivers to Work with System 6

=====

Article Created: 26 August 1991

### Article Change History

-----

08/18/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

How do I install the new LaserWriter 7.0 drivers to work properly with System 6?

### DISCUSSION -----

To properly install the new LaserWriter 7.0 drivers under System 6 or later, be sure to use the Installer found on the Printing Tools disk or in the Printing Tools folder (if using a Network Installer found on a local AppleShare File Server). Using the Installer ensures that Print Monitor (which allows printing to a LaserWriter in the background) will work under system software version 6.0.5 or later with MultiFinder.

Note that if you're using the Installer from a floppy disk, you don't need to restart your Macintosh. The Installer can install "live" over system software currently in use.

Follow these steps:

- 1) Launch the Installer.
- 2) Click the OK button when the opening display screen appears.
- 3) You are now at the Easy Install screen. You can click Install to update all of the printer drivers you have currently installed.

Otherwise, click on the Customize button to choose individual printer drivers.

- 4) Once you make your choices and click the Install button, the Installer installs the software and prompts you to quit. A restart is not necessary.
- 5) Please note that the default (suggested) memory size for Print Monitor is 80K.

Note: We recommend system software version 6.0.5 or later when using version 7.0 drivers. Version 6.0.8 comes with version 7.0 drivers. Anything below version 6.0.5 may not be fully compatible.

Macintosh: Connecting to SAG's Natural Connection

=====

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I want connect a Macintosh directly to an IBM 3174/3274/3276 TCU using Type A coax cabling.

The communication protocol required is IBM 3270 D.S. with support for CUT and DFT modes. There must be file transfer facilities which interfaces with FT/TSO on the IBM host. The software must also be compatible with SAG's Natural/Connection software.

I'm interested in trying MacDFT with Coax/Twinax card, but I need to know if MacDFT is compatible with SAG's Natural/Connection software.

DISCUSSION -----

Software AG does distribute a "Natural Connection for the Macintosh" (and for OS/2, and for MS-DOS). It requires a minimum of a Macintosh Plus, with 1MB of RAM and 2 floppies. Their Macintosh application consumes from 348K of RAM (B/W) to 640K (color) or more depending upon the font selected. For color or MultiFinder support you must use Macintosh System Software 6.0.4 or later. The host Natural software must be version 1.2 or 2.1.

The hardware supported include the Apple Coax/Twinax card, DCA's MacIrma, and Avatar's MacMainFrame. AppleTalk support is provided via the Netway 1000 or 2000. The host and client software also supports dialup connectivity.

For More information, search under: "Software AG"

## Personal LaserWriter LS: Use Prep with System 6.0.7 (8/93)

Revised: 8/13/93  
Security: Everyone

Personal LaserWriter LS: Use Prep with System 6.0.7 (8/93)

=====

Article Created: 13 August 1991  
Article Reviewed/Updated: 12 August 1993

TOPIC -----

Do the production disks for Personal LaserWriter LS include a Personal LaserWriter LS icon and a LaserWriter Prep icon? I downloaded the driver from AppleLink and the Prep file wasn't included. I couldn't get it to work on System 6.0.7 without Prep.

DISCUSSION -----

The Personal LaserWriter LS Prep file is in fact a "serial" driver needed for systems running System Software 6.0.7. System 7 contains this new serial driver, making the prep unnecessary.

There are two versions of the Personal LaserWriter LS "printer" driver: the one shipping originally with the printer, version 1.0, and the latest version that ships with System 7, version 7.0. The System 7 driver is preferred as it is faster and contains solutions to earlier problems; this version is compatible with systems running System Software 6.0.7 when used with the (version 1.0) Personal LaserWriter LS Prep file.

## A/UX: Transferring Binary Data to Macintosh OS (8/94)

Revised: 8/24/94  
Security: Everyone

A/UX: Transferring Binary Data to Macintosh OS (8/94)

=====

Article Created: 13 August 1991  
Article Reviewed/Updated: 23 August 1994

TOPIC -----

I want to transfer UNIX files that contain binary data (but are not executable) to the Macintosh environment. Normally, the linefeeds in these files are converted to carriage returns, but I don't want to let that happen. Any hints?

DISCUSSION -----

By default, the A/UX file manager converts a line feed into a carriage return when copying a "TEXT" file from an A/UX partition to a Macintosh HFS partition. If the source file was binary executable or a non-executable data file, A/UX file manager copies it intact (without conversion).

In this case, make sure the source file that's going to be copied from an A/UX partition is a Non-TextEdit document (although you want to make sure it IS binary data). The file type can be shown by "Get Info" or the icon on the desktop.

If you are sure it's binary data but you are shown a "TextEdit" document, you have to use the A/UX "setfile" (set attributes for Macintosh files) utility to change its type and creator.

Here is an example: the /usr/lib/font/ftS is a binary data file, but it shows a "TextEdit" document via "Get Info" or icon. Before copying it (without any conversion) to a Macintosh OS HFS partition, do the following to change its file type to binary and creator to A/UX:

```
# setfile -t"BIN " -c"A/UX" ftS
```

NOTE: The file type and creator must be exactly 4 characters long including SPACES.

## A/UX: FASYNC And Other Asynchronous Flags Supported (8/94)

Revised: 8/30/94  
Security: Everyone

A/UX: FASYNC And Other Asynchronous Flags Supported (8/94)

=====

Article Created: 13 August 1991  
Article Reviewed/Updated: 29 August 1994

TOPIC -----

Is the FASYNC signal supported in A/UX?

DISCUSSION -----

A/UX supports asynchronous signals (such as FASYNC) on sockets. An asynchronous socket implies that requests will not block.

To receive signals on sockets however, you must do a SIOCSPGRP ioctl call, or a F\_SETOWN fcntl call on the socket that will be receiving signals.

Security: Everyone

LaserWriter: Clarifying Serial Switch Documentation

=====

Article Created: 13 June 1991  
Article Last Reviewed: 23 August 1991  
Article Last Updated:

TOPIC -----

The LaserWriter IINTX manual says that revision 3.0 ROMs can switch between ports using software. The manual says I can disable the RS-422 port to connect an IBM to the RS-232-C port, but it's not clear whether the RS-422 and the RS-232-C ports can be switched while using the IBM.

I have been disabling the RS-232-C port by sending the following program to the printer from the IBM:

```
serverdist begin 0 exitserver
statusdict begin
25 0 0 setsccbatch
25 0 0 setsccinteractive
```

This sets the serial port to a null baud rate. The manual states that the RS-422 port can then be reenabled by typing the same program but using 9 instead of 25 and substituting the desired baud rate for the first zero and the Options Number from the chart labeled C-5 for the second number. This is found on page 141 of the LaserWriter IINTX manual.

However, in apparent contradiction to this, the LaserWriter Reference Manual from Addison Wesley states on page 143 that the setsccbatch and the setsccinteractive commands use the port assignment for the first digit, the baud rate for the second digit, and the parity for the third digit (not the options number!)

Is this third digit supposed to be the options number from the LaserWriter IINTX owners manual, or is it the Parity from the listing of parity digits available on page 144 of the LaserWriter Reference Manual? What IS the options number or the parity selection?

I also am having trouble with the baud rate selection for the AppleTalk port. AppleTalk is supposed to be 235K baud, but there is no selection above 56K baud.

#### DISCUSSION -----

The setscbatch and setscinteractive operators set a port's baud rate, but for asynchronous communications only. More specifically, they set the rate used when the hardwareiomode is set to 0. The only time AppleTalk communications are affected by these operators is if the baud rate of the 9 (or 8) pin port is set to 0.

Setting a port's baud rate to 0 has the effect of disabling it entirely, whether asynchronous serial or AppleTalk is in use. To reactivate the port, either set the baud rate to whatever is desired, or for AppleTalk, set the hardwareiomode to 2 and don't bother with the baud rate.

Page 141 of the LaserWriter IINT/IINTX Owner's Guide contains a misleading paragraph that states the RS-422 port is reactivated by setting its baud rate. You could, in fact, enable it this way for asynchronous communications, but AppleTalk can only be activated by setting hardwareiomode to 2.

As for the apparent contradiction between the Addison Wesley manual and the Owner's Guide, they're both right - they just tell a different part of the same story. The options number used with setscbatch and setscinteractive is an 8-bit value made up of 4 separate bit-fields; 2 bits for parity, 3 bits for flow control, 2 bits for data bits, and 1 bit for stop bits, in that order. They are arranged with parity being the least significant 2 bits, and stop bits being the most significant bit of the byte. Since each parameter can be computed and set independently, any value from the table on page 153 can be used individually. Though it's more common to add each parameter's value and set them all at once, it is possible to use something like "3" for the options value to set mark parity. This will leave the other parameters as they are. Likewise, data bits could be set to 8 by using "64" as the options value. Parity, flow control and stop bits would remain unchanged.

Currently the easiest way to set LaserWriter parameters is to use a PostScript downloading utility to send PostScript programs written in a word processor. This downloading function is available in recent versions (7.0 or later) of the LaserWriter Font Utility. A more direct method is available with Microsoft Word by using its PostScript style. Text that is of the style PostScript will be passed to the LaserWriter as a PostScript program instead of as text to be printed.

DAL: Support for PICK Database

=====

Article Created: 13 August 1991  
Article Last Reviewed: 29 June 1992  
Article Last Updated: 29 June 1992

TOPIC -----

I'm interested in using DAL with a PICK database, or rather a Unidata PICK clone that runs under UNIX and supports SQL (which the real PICK does not).

Have you heard of any such database? If not, do you have any feel for how long it takes to write a new DAL server based on the DAL server package?

DISCUSSION -----

There is no DAL server/adaptor for PICK databases.

There is no facility to enable non-licensed creation of servers or DBMS adapters to work with DAL.

Macintosh: Terminal Emulators for UNIX Systems

=====

Article Created: 13 August 1991

### Article Change History

-----

08/31/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

I need a UNIX terminal emulator (to run on a Macintosh) that will do the following:

- Toggle between 80 character mode to 132 character display
- reverse video
- Downline load ASCII files

### DISCUSSION -----

UNIX systems support almost all types of terminal available. One of the most popular terminal types supported is the Digital VT100 series. Lots of Macintosh programs support this terminal type, especially the later ones which use the Communications ToolBox.

MacTerminal 3.0 allows you to use the VT102, or the VT320 Tools. In the Screen setting, you can toggle between 80/132-columns, and select inverse video. In the File Transfer setting, you can select files transfer using the Text Tool, or the XModem Tool.

Pacer's PacerTerm and Synergy's VersaTerm-Pro also use the Communications ToolBox and support other Tools besides the Apple Tools.

For more information, search on the above product names.

PATHWORKS 1.0: No Official Support for HP LaserJet

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Does PATHWORKS 1.0 support HP LaserJet? Does the print driver from the  
PATHWORKS (either 6.0 or 7.0) support LaserJet?

DISCUSSION -----

Officially, PATHWORKS 1.0 Print Services only support following PostScript  
printers:

| Printer<br>-----   | Connected to the VAX computer through<br>-----              |
|--------------------|-------------------------------------------------------------|
| Digital LPS20      | Ethernet                                                    |
| Digital LPS40      | Ethernet                                                    |
| Digital LPS40 Plus | Ethernet                                                    |
| Digital LN03R      | Serial Connection                                           |
| Apple printers:    | LocalTalk/Ethernet bridge or an RS-232 serial<br>connection |
| LaserWriter Plus   |                                                             |
| LaserWriter IINT   |                                                             |
| LaserWriter IINTX  |                                                             |

The PATHWORKS print drivers are for the above PostScript printers only.

## VAXshare: Printer Services and LaserWriter Zones

Revised: 9/24/91  
Security: Everyone

VAXshare: Printer Services and LaserWriter Zones

=====  
Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Apple Technical Support says that a "VAX can be in a different zone than the LaserWriter printers, but there can only be one zone for the non-extended LocalTalk network where the LaserWriter printers are".

Referring to the following diagram, can I configure all printers serially connected to the VAX to be in Zone A and LaserWriter X to be in Zone B, and LaserWriter Y in Zone C (assuming I also upgrade FastPath to support AppleTalk Phase 2)?

DISCUSSION -----

It is not clear from your description that the printer connected to the VAX serially is a Digital PostScript printer or an Apple LaserWriter. Nevertheless, the answer is Yes, you can configure the printers in those zones.

Here is more information:

1. If you connect the LaserWriter directly to the VAX computer as a serial device, follow the following steps from the Digital System Administrator's

Guide:

1.1. Connect a straight through RS-232 cable from the 25 pin connector on the back of the LaserWriter to the serial output connector on the VAX computer.

1.2. Set the printer switches as follows:

| Printer           | Settings                       |
|-------------------|--------------------------------|
| -----             | -----                          |
| LaserWriter       | 4 position mode switch to 9600 |
| LaserWriter Plus  | 4 position mode switch to 9600 |
| LaserWriter IINT  |                                |
|                   | 1 Up                           |
|                   | 2 Down                         |
| LaserWriter IINTX |                                |
|                   | 1 Up or Down                   |
|                   | 2 Down                         |
|                   | 3 Up                           |
|                   | 4 Up                           |
|                   | 5 Down                         |
|                   | 6 Down                         |

1.3. Set the VMS terminal line to which the printer is connected by entering the following command:

```
$ SET TERMINAL device-name:
_$ /NOAUTOBAUD/NOBRDCSTMBX/NOBROADCAST-
_$ /DEVICE_TYPE=UNKNOWN-
_$ /NODISCONNECT/NOECHO/EIGHT_BIT/NOESCAPE-
_$ /FORM/FULLDUP-
_$ /HARDCOPY/HOSTSYNC/LOWERCASE/PASTHRU/PERMANENT-
_$ /SPEED=9600/TAB/TTSYNC/TYPE_AHEAD/NOWRAP
```

For subsequent reboot of the VAX, add the above line to the SYS\$STARTUP:SYSTARTUP\_V5.COM file. Be sure you enter this line before the SYS\$STARTUP:MSA\$STARTUP.COM line.

1.4. Add the VAXshare LaserWriter printer service. The following example creates a LaserWriter printer service called "Serial LaserWriter" with a queue name, "LW\_SERIAL".

```
$ ADMIN/MSA
MSA$MANAGER> ADD PRINTER "Serial LaserWriter"-
_MSA$MANAGER> /QUEUE=LW_SERIAL/DEST=device_name:
MSA$MANAGER> EXIT
```

1.5. To create the queue and start the service, enter the following command:

```
$ ADMIN/MSA START PRINTER "Serial LaserWriter"
```

2. If the printer connected to the VAX is a Digital PostScript printer, you need to specify the Printer Service name and VMS queue name to add a VAXshare printer service for it. You need to know the name of an existing VMS printer queue for which you want to set up printer services. If you do not have an existing queue, create one by using the standard VMS commands. The printer service will appear in the zone the VAX is in, which is Zone A in your example.

```
$ ADMIN/MSA
_MSA$MANAGER> ADD PRINTER "Digital printer"-
_MSA$MANAGER> /QUE=LPS_20_POST-
_MSA$MANAGER> /PARAM=(DATA_TYPE=PostScript)-
MSA$MANAGER> EXIT
```

3. Assuming that your FastPath is upgraded to support AppleTalk Phase 2, both the LaserWriter printers in the LocalTalk network can be added to VAXshare print services. The /DESTINATION will be used to specify the zones where the printers reside. For example, the following defines the LaserWriter X and Y in Zone B and Zone C as LaserWriter X and Y Spoolers.

```
$ ADMIN/MSA
MSA$MANAGER> ADD PRINTER "LaserWriter X Spooler"/QUEUE=LWX_PRINT-
_MSA$MANAGER> /DESTINATION="LaserWriter X@Zone B"-
_MSA$MANAGER> /DEFAULTS=(FLAG, TRAILER, FORM=LTR_12)-
_MSA$MANAGER> /FONTS=MSAP$FONTLIST_APPLE35.TXT
_MSA$MANAGER> ADD PRINTER "LaserWriter Y Spooler"/QUEUE=LWY_PRINT-
_MSA$MANAGER> /DESTINATION="LaserWriter Y@Zone C"-
_MSA$MANAGER> /DEFAULTS=(FLAG, TRAILER, FORM=LTR_12)-
_MSA$MANAGER> /FONTS=MSAP$FONTLIST_APPLE35.TXT
MSA$MANAGER> EXIT
```

## StyleWriter and ImageWriter: Printer Modes

Revised: 9/24/91  
Security: Everyone

StyleWriter and ImageWriter: Printer Modes

=====

Article Created: 13 August 1991  
Article Last Reviewed: 23 August 1991  
Article Last Updated:

TOPIC -----

I'm using TrueType, a StyleWriter and an ImageWriter. I upgraded to System Software 6.0.7, then to System 7.0. Both printers only work in BEST mode (not in the Draft or Fast mode).

Could this be due to the outline font technology (instead of bitmap)?

DISCUSSION -----

The use of the effect of the "outlined" font has nothing to do with the disabling some of the print quality button selection.

Your problem is probably caused by how the application deals with the printer driver. Often when the application run into an unfamiliar printer driver, it will use the low level printer driver call, SetRsl to set printer resolution to the maximum. If this is done when using the StyleWriter, the "faster mode" push button will be disabled.

Applications like MacWrite, that talks only to the high level print driver, do not have this problem.

## DAL: How It Accesses DB-2 Tables via VTAM or CICS

Revised: 6/29/92  
Security: Everyone

DAL: How It Accesses DB-2 Tables via VTAM or CICS

=====

Article Created: 13 August 1991  
Article Last Reviewed: 29 June 1992  
Article Last Updated: 29 June 1992

TOPIC -----

- 1) How does DAL access DB2 tables in the VTAM version and when using the CICS passthru program?
- 2) How does DAL implement "stored procedures" on the host?
- 3) Please explain how the DAL-APPC implementation works?

DISCUSSION -----

- 1) DAL uses the standard "TSO to = specs batch DB2 interface" to communicate with DB2. Security is supported via standard RACROUTE calls. The VTAM server is a multi-user server that runs as a batch job (or a started task) and that has a VTAM API front-end that controls access. The user needs a valid ID and password, but does not log on to TSO. Instead the user issues a "logon applid(\_\_\_\_)" command to connect to the VTAM Server. With the CICS passthru, the user logs on to CICS and requests the CICS transaction which uses APPC (LU62) to connect to the VTAM front-end of the server. CICS can be at version 1.7 but the PUT for LU6.2 support must have been applied to allow DAL VTAM Server access (version 2.1, or better, of CICS includes this LU62 support).
- 2) Stored procedures are kept in the DAL.AUTOEXEC file that is installed with the Server. (Only two sample database connection procedures are shipped with the server.) You can create your own procedures and store them there for general use. See the Server Installation Guide for more detail on this issue.
- 3) APPC communication from the client to the VTAM server (as opposed to from CICS to the VTAM server) requires the Apple product SNA•ps and

its APPC Gateway. This connection type will allow for faster data transfer because it is not using the LU2 protocols (3270 data streams) but instead the LU6.2 protocols (APPC). Only the direct access method ("logon applid(\_\_\_\_\_)") to the VTAM server supports this protocol. The CICS passthru requires 3270 protocols (since CICS requires them) and therefore is supported by all the current network connections that support TSO server access.

09/11/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

I have two monitors attached to my Macintosh. I'd like a trash can in each of them. Is this possible?

### DISCUSSION -----

Yes, System 7 lets you make aliases for your trash can -- as many as you like. Here's how:

- 1) In the finder, select the Trash icon.
- 2) Choose Make Alias from the File menu. A new icon appears, named "Trash alias"
- 3) If you like, rename the alias -- anything but "Trash" -- and drag it to the other screen.

If you drag, say, a document into the new trash icon, the document actually goes into the original Trash. The original Trash icon expands to indicate there's something in it (though your alias will not bulge).

If you decide you no longer want an extra trash can, drag it into (you guessed it!) the original Trash.

## Macintosh LC: Third-Party Solution For Co-Processor

Revised: 7/24/92  
Security: Everyone

Macintosh LC: Third-Party Solution For Co-Processor

=====

Article Created: 13 August 1991  
Article Last Reviewed: 23 July 1992  
Article Last Updated: 10 December 1991

TOPIC -----

Is there any way to install a co-processor into a Macintosh LC?

DISCUSSION -----

Apple does not have a co-processor option for the Macintosh LC. However, our information search, which included the Redgate Macintosh Registry on AppleLink, provided these third-party solutions:

- "DataLink LC" and "FastMath LC" from Applied Engineering
- "MacCon+ series" from Asante Technologies
- "DaynaPort E/LC" from Dayna Communications
- "Apex" from Second Wave
- "QuikMath/LC" from System Technology Corp.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

HD Setup: Differences Between Version 2.0.1 and 2.0.3

=====

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I need to find out what the differences are between HD Setup 2.0.1, 2.0.3 and the HD Setup for System 7.0B4.

I am especially interested in how initialization and bad sector mapping have changed and about reentrance code and where it resides on the drive.

DISCUSSION -----

The differences between 2.0.1 and 2.0.3 were very minor minor bug fixes that never did crop up in normal use but the engineers knew they were there and fixed them anyway.

For the System 7 driver, it was modified to include a reentrant driver for support of virtual memory. The driver is written to the disk very early in the boot process to a portion of the drive to which we, as users, do not have access.

## Apple Does Not Release ELF Radiation Information

Revised: 6/11/92  
Security: Everyone

Apple Does Not Release ELF Radiation Information

=====

Article Created: 13 August 1991  
Article Last Reviewed: 1 June 1992  
Article Last Updated:

TOPIC -----

How can I get ELF radiation information on Apple products?

DISCUSSION -----

Currently, it is Apple policy not to release this information unless there are extenuating circumstances (eg. a large bid on hold until ratings can be released under non-disclosure.) To date, ELF specific information has not been released to any customers.

At this time there is no standard for measuring and reporting VLF/ELF emissions. Without standards the numbers are meaningless unless they are compared only with other monitors measured in the same manner. Apple is using a Combinova® meter for measuring EMI, and a Radians-inova® meter for measuring ELF/VLF. The results of this testing are kept within the engineering group. Apple is taking the ELF/VLF issue seriously and is promoting significant research to study it.

Apple insures that all of its products meet government regulations for the countries in which they are sold. A great deal of time and energy is being focused on the reduction of ELF/VLF emissions from our products, but at this time no product announcements have been made. Apple's official policy is that ELF/VLF emissions do not appear to pose a threat, and that additional studies need to be done.

Relatively low cost test instruments are available for those who wish to do their own comparison testing. Holaday Industries, Inc. sells test equipment which will measure ELF/VLF emissions. In addition, they offer occasional seminars covering various aspects of VDT emissions related issues. For more information, search under "Holaday Industries".

TOPIC -----

I have a hard drive which I would like to be able to connect to any Macintosh, from a Macintosh Plus to a Macintosh IIfx.

Will the lower-end Macintoshes operate if the hard drive is using System 6.0.7?

DISCUSSION -----

System 6.0.7 is compatible all the way down to the Macintosh Plus; the only real requirements are 1MB of RAM and 800K disk drives. Your hard drive should work fine.

The one thing to remember is that you do not want to use this external hard drive you will be carrying around as the startup drive, because the installer scripts for each machine is different. In other words, you need to set up the system software for a particular machine. This would cause a problem if you used the hard drive as the startup drive on different model macintoshes. The only exception would be if the machine you connect it to is set up with the same installer scripts as the hard drives system software.

System 6.0.7: Troubleshooting Font Loading Problems

=====

Article Created: 13 August 1991  
Article Last Reviewed: 13 July 1992  
Article Last Updated: 13 July 1992

TOPIC -----

I'm having a problem with the Font/DA Mover on several networked Macintosh computers running System 6.0.7. Only one computer will load some PostScript Fonts. Other machines either lock up or have systems errors.

DISCUSSION -----

Make sure that you are using at least version 3.8 of the utility. You mentioned PostScript fonts, but Font/DA Mover only moves bit images. It is possible that older bit fonts have a problem with the latest Font/DA Mover. These fonts would be fonts that don't include the FOND Resource.

If that is the case, you should open the suitcase containing these fonts and then save them to a new suitcase. This will create a FOND resource for them. Then copy these fonts to the System file.

TrueType: Using With Non-Apple Printer

=====

Article Created: 13 August 1991  
Article Last Reviewed: 8 June 1992  
Article Last Updated: 8 June 1992

TOPIC -----

I have a Macintosh Classic running System 6.0.7 and an NEC SilentWriter 290 PostScript laser printer. I would like to use TrueType fonts for better screen display of text.

Can the TrueType fonts be used with the NEC printer, and what would have to be loaded onto the Macintosh Classic?

DISCUSSION -----

TrueType is compatible with any output device as it is a self-contained driver and font set. Since you are running System 6.0.7, you have to install the TrueType INIT, and the specific TrueType fonts you wish to use. System 7 has the functionality of TrueType built in, so those running System 7 do not have to install the INIT, just the specific fonts they wish to use.

The INIT is available on the StyleWriter and Personal LaserWriter LS diskettes, or through authorized Apple resellers.

## A/UX 3.0: Root File System Is Full Error Workaround (3/95)

Revised: 3/24/95  
Security: Everyone

A/UX 3.0: "Root File System Is Full" Error Workaround (3/95)

=====

Article Created: 13 August 1991  
Article Reviewed/Updated: 24 March 1995

TOPIC -----

I think I overfilled one of the drives with data; when I enter any A/UX command, I get "Cannot execute this command. The root file system is full".

I have tried cancelling when booting A/UX, but I still cannot execute any commands, even from that shell. Is there any way to get in and erase some files in my root file system?

DISCUSSION -----

Interrupting A/UX from booting will bring you to the "A/UX Startup" mode or what is called SASH (Standalone Shell). You should get a startup# prompt.

Under startup#, try a "fsck" (file system check and repair) or a "rm" (remove a file).

If neither of these works, try the "chroot" (change root) command to change the current working root directory to a different one, like "Eschatology 1". To change the current working root directory to "Eschatology 1", do the following (where X is the SCSI ID of the A/UX boot drive):

```
startup# pname -cX -s3 "Eschatology 1"  
startup# chroot (X,0,3)/
```

```
startup# rm (X,0,0)/FILES-ON-THE-DEFAULT-ROOT-TO-BE-REMOVED
```

After removing all the files you need, you can change back to the default root directory by issuing the command

```
"chroot (0,0,0)/"
```

Make sure do "fsck" on the default root filesystem to get a "clean" root file

system.

A/UX: Questions About "Alerts" (8/94)

=====

Article Created: 13 August 1991  
Article Reviewed/Updated: 29 August 1994

TOPIC -----

1. How do A/UX alerts work? If I am using a Macintosh or hybrid application, when an alert appears, can I switch to another process and/or Mac application?
2. If the process has a fatal system error when running A/UX, do I have to restart the Macintosh or only the process itself? How about a system bomb when running a Mac Application?

DISCUSSION -----

1. You do have to deal with the alert in A/UX before switching to another process. This is the same as modal dialogs under the Macintosh operating system.
2. This is also similar to the Mac OS: it depends on "how fatal" the error is. Some errors, such as Out Of Memory conditions, only affect the active application. Other errors will trash significant portions of A/UX and freeze the system (this is what a Macintosh application will do if it bombs); others may disable the OS, but allow you to gracefully exit the other processes. There are really too many variables to predict exactly what will happen.

AppleShare: View By Icon Folders can't be Changed by Users

=====

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Is there any way to keep the folders and/or documents contained on an AppleShare File Server in a set order when viewed by icon? I have a 160MB File Server that has about 40 folders in it. Users are complaining that every time they connect to the server, they can't find a folder where they put it last.

DISCUSSION -----

The actual views that an individual server user sees can be modified by the user but they will revert to the layout that the server administrator set up.

If the users can agree on a set organization of the folders, boot the server with a diskette and rearrange the folders then restart the server.

This is the only way for the folders to stay arranged in such a way as each user wants.

AppleShare: Can't Have A "Wild Card" Volume Name

=====

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have a series of Macintosh Laboratories that are set up to use a single, "Campus Standard Startup disk". This disk is a floppy that students can take to any lab on campus, insert into a Macintosh, turn on the machine and have the server volume come up automatically.

All the servers have the name "Server" and there is an "\*" in the AppleShare Prep file that I am told tells the Macintosh to look for the server in "the zone you are in". In the past, when a new lab has been brought up, we have just added the new server volume name to a list in the prep file. This is not working any more.

Is there any way we can get the format of the AppleShare Prep file? Or is there a way we can use the "\*" to tell it to mount "whatever volume is on that server" like the "\*" for zones?

DISCUSSION -----

It is not possible to use a wild card for the volume name. It would appear that you are changing something in the AppleShare Prep file that is being ignored.

This is the "includes" definition for the Boot Mount List (BMLS resource).

Macintosh Portable: Don't Ignore Battery Icon

=====

Article Created: 13 August 1991  
Article Last Reviewed: 29 July 1992  
Article Last Updated:

TOPIC -----

How can I remove the battery icon that appears in the upper right hand corner of my Macintosh Portable screen? It interferes with "Balloon" Help and my SuperClock. I can't seem to find a way of controlling its presence in the menu bar.

DISCUSSION -----

One reason for the icon's appearance is running the battery desk accessory; the Application Menu icon will show the DA's battery icon (in the top right corner).

Another possibility is that the battery is low, and the battery DA is flashing its icon as a notification to recharge.

Before you try to suppress it, it's important to know whether it's telling you something important.

TOPIC -----

I have a MiniMicro 386 with a microchannel bus. I'm in a Macintosh environment and want to print to the LaserWriter IINT.

I bought a Radio Shack cable 9- to 25-pin with transmit and receive reversed. I put the LaserWriter IINT into Diablo 630 Emulation Mode. When I tried to print, signals were sent to the printer but all that came out was a blank sheet. I then used a straight-through RS-232 cable with a null modem and got the same results.

Any suggestions?

DISCUSSION -----

The problem printing serially could be caused by a number of things, but a straight-through cable with a null modem at the LaserWriter end should provide a workable solution.

However, you also need to make a couple of Mode Command statements to direct the output correctly to the LaserWriter. The commands are:

Mode: LPT1 96,N,8,1,P  
Mode: LPT1 = COM1

System 6.0.7 Installer: Problem with TrueType

=====  
Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

The System 6.0.7 Installer seems to have trouble dealing with reinstalling the System software onto a disk that is using TrueType.

Even when the Installer is just doing a simple installation, it compares the Backgrounder that it has with the one that's been installed, and refuses to continue unless it's given permission to replace the newer Backgrounder with the older one.

Is there a solution to this problem that DOESN'T require extreme acrobatics? Or will I have to install the System software, replacing the new files with the old, then reinstall the TrueType set?

DISCUSSION -----

Unfortunately, here is no way around this situation. The System Software 6.0.7 Installer was released many months before the StyleWriter and Personal LaserWriter LS were introduced. The installer script writers did not anticipate this situation.

System 6.0.7: EtherTalk, CD-ROM Driver Installation

=====

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have a Macintosh IIsi with a CD-ROM and Ethernet Board. I need drivers for using both of these devices with System 6.0.7 and Installer 3.0 or greater.

DISCUSSION -----

The Installer required to install the EtherTalk drivers are located on the Network Products Installer Disk, which is located in the "Read Me First" manual that came with the Macintosh IIsi.

There isn't an updated installer for the CD-ROM drivers, but there is a workaround. Just drag the following files into the System Folder:

- Apple CD-ROM
- Foreign File Access
- Audio Access
- CD Remote INIT
- ISO 9660 File Access
- High Sierra File Access

Use Font/DA Mover to install the CD Remote desk accessory, then restart the system.

AppleShare Admin: What To Do If You Lose the Password (10/95)

=====

Article Created: 13 August 1991  
Article Reviewed/Updated: 6 October 1995

TOPIC -----

If I've lost or forgotten the Administrator's password on an AppleShare file server, what do I do?

DISCUSSION -----

If you have forgotten the Admin key, refer to the following sources:

WARNING:  
All of the procedures listed below require a back-up copy of the "Users & Groups" file. Be sure that you have a back-up copy of this file before starting the procedure.

For AppleShare 1.0 or 1.1 File Server

-----

See page 137, chapter 6, in the "AppleShare Administrator's Guide." Below is the information referenced in the "AppleShare Administrator's Guide":

You have forgotten the Admin key

If you forget the Admin key that you use while opening AppleShare Admin and don't have it written down, you'll have to:

- 1) Use the AppleShare Server Installer disk to start up the server's Macintosh Plus.
- 2) While in the Finder, locate the Users & Groups file in the Server Folder of the startup volume, drag it to the Trash, and choose Empty Trash from the Special menu.
- 3) Open the AppleShare Admin application.
- 4) Select the same startup volume that you had before.
- 5) When you're asked to select a Users & Groups file, select the backup

copy of the Users & Groups file.

Click Volume until you see the disk name. Click Eject to insert another disk. If necessary, open any folders in the list until you see the backup copy of the file. Select the file and click Open.

- 6) When asked, type the server name and the new Admin key.
- 7) Continue to follow the procedure for preparing the server.

#### For AppleShare 2.0 or 2.0.1 File Server

-----

See page 204, chapter 7, in the "AppleShare File Server Administrator's Guide." Below is the information referenced in the "AppleShare Administrator's Guide":

You've forgotten the Admin key

If you forget the Admin key that you use to open AppleShare Admin and don't have a written copy, you'll have to use the following procedure.

- 1) Use the Server Administration disk to start up the server's Macintosh.
- 2) While in the Finder, locate the Users & Groups file in the Server Folder of the startup volume, and then drag it to the Trash and choose Empty Trash from the Special menu.
- 3) Open the AppleShare Admin application.
- 4) Prepare the same startup volume you had before.
- 5) When you're asked to select a Users & Groups file, select the backup copy of the Users & Groups file.  
Click Volume until you see the disk name. (If necessary, click Eject and then insert another disk.) Open any necessary folders in the list until you see the backup copy of the file. Select the file and click Open.
- 6) When asked, type the new Admin key.
- 7) Continue to follow the procedure for preparing the server.

#### For AppleShare 3.0 or 3.0.1 File Server

-----

See page 147, chapter 8, in the "AppleShare Server 3.0 Administrator's Guide." Below is the information referenced in the "AppleShare Administrator's Guide":

You've forgotten your Admin key

The Admin key is stored in the Users & Groups Data File. If you forget the Admin key, drag the Users & Groups Data File out of the Preferences folder to the root level of the System Folder. Then restart the Admin program. In a moment the program will ask you to provide a new file server name and Admin key. Enter the same file server name, and a new Admin key.

#### For AppleShare 4.0 File Server

-----

See page 107, chapter 6, in the "AppleShare Administrator's Guide" (p/n 030-4205-A), or see page 93, chapter 5, in the "AppleShare Administrator's Guide" (p/n 030-6925-A) Also remember the serial number. Below is the

information referenced in the "AppleShare Administrator's Guide":

You've forgotten your Admin Key.

The Admin Key is stored in the Users & Groups Data File. If you forget the Admin Key, quit the AppleShare Admin and AppleShare File Server programs. Then drag the Users & Groups Data File out of the Preferences folder to the System Folder. Then restart the Admin program. In a moment the program will ask you to provide a new file server name and Admin Key. Enter the same file server name, and a new Admin Key.

Following this procedure assigns a new Admin Key and creates a new Users & Groups Data File in the Preferences folder. All of the original user and group accounts, passwords, and access privileges for shared volumes are copied from the old Data File in the System Folder. You can now delete the old Data File.

For AppleShare Pro File Server

-----  
See page 106, chapter 6, in the "AppleShare Pro Administrator's Guide." Below is the information referenced in the "AppleShare Administrator's Guide":

You've forgotten your Admin Key.

The Admin Key is stored in the Users & Groups Data File. If you forget the Admin Key, quit the Admin program (and File Server program, if necessary). Then drag the Users & Groups Data File out of the Preferences folder to the top level of the System Folder. Do not drag it out of the System Folder. (Use the System Folder alias to open the System Folder.) Then restart the Admin program. In a moment the program will ask you to provide a new file server name and Admin Key. Enter the same file server name, and a new Admin Key.

Following this procedure merely assigns a new Admin Key. All of the original user and group accounts, passwords, and access privileges for shared volumes are retained. After you've restarted the Admin program, you can throw away the copy of the Users & Groups File you moved from the Preferences folder. It is replaced by a new one within the Preferences folder.

#### Article Change History:

05 Oct 1995 - Added the AppleShare Administrator's Guide information.  
26 Sep 1995 - Added additional information for AppleShare 4.0.  
09 Nov 1994 - Added notation about serial number for AppleShare 4.0.x.

AppleShare: Systems after 6.0.3 Need Network Products Installer

=====

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Is there any way to get AppleShare Installer with System 6.0.5? Can I just make a set of disks with System 6.0.5?

DISCUSSION -----

It's not possible to upgrade the AppleShare Installer to System 6.0.5; disastrous things could happen if you tried the upgrade and then attempted an installation. The AppleShare Admin disk can be upgraded to System 6.0.5, as the application itself doesn't depend on the system version.

If you need to install AppleShare software onto a computer that requires a higher version of the System than 6.0.3 (like a Macintosh IIci or Macintosh IIfx), then you need to use the Network Products Installer Diskette to install the software. This disk is shipped with the computer (not the operating system) and can be found in the "Read Me First" booklet, which is inside the "Open Me First" box.

ImageWriter I: Troubleshooting with Macintosh Classic (2/96)

=====

Article Created: 13 August 1991  
Article Reviewed/Updated: 5 February 1996

TOPIC -----

I cannot get my Macintosh Classic to work with my ImageWriter I.

DISCUSSION -----

Step 1

-----

Make sure that the ImageWriter I printer's switch settings are correct:

Switch 1

1-Off  
2-Off  
3-Off  
4-Off  
5-Off  
6-On  
7-Off  
8-Off

Switch 2

1-ON  
2-ON  
3-OFF  
4-XX

Step 2

-----

Verify that you are using the correct cable. Cable part number 590-0555, or the original Macintosh to ImageWriter DB-9 to DB-25 cable (part # 590-0169) with the

DB-9 to Mini DIN 8 Macintosh Peripheral Adapter cable (part # 590-0553) can be used.

#### Step 3

-----

From the Chooser, verify the following:

- ImageWriter driver is selected
- AppleTalk is off
- The correct port is selected

If this does not work, you may want to start looking for hardware failures: Try the ImageWriter on another computer, then try another printer with your computer.

#### Article Change History:

05 Feb 1996 - Added additional cable information.

## DART: Utility for Duplicating Floppy Disks (10/93)

Revised: 10/6/93  
Security: Everyone

DART: Utility for Duplicating Floppy Disks (10/93)

Article Created: 13 August 1991  
Article Reviewed/Updated: 6 October 1993

TOPIC-----

Is there a Macintosh utility program for duplicating Macintosh, Lisa, Apple II or MS-DOS 3.5-inch floppy disks?

DISCUSSION -----

DART (Disk Archive/Retrieval Tool) is an application that enables you to duplicate Macintosh, Lisa, Apple II, or MS-DOS disks, save disk images, and create disks from image files. DART 1.5 can read disk image files in DART, DiskMaker, or Disk Copy format. DART 1.5 image files are compressed, approaching a reduction in size comparable to that obtained by using a commercial compression utility. DART 1.5 is System 7.0 "savvy", and implements a custom Apple event mechanism to automate the conversion of older DART or Disk Copy files to 1.5 format. The conversion process can be run by "remote control" (even across a network!) using an accompanying HyperCard stack. (For more information, please refer to the DART User Manual.)

Features of DART 1.5

- Data compression: more disk images can be archived in the same amount of space.
- Data checksumming for reliable disk duplication.
- Can read Disk Copy image files.
- Requires only 224K of RAM to run.
- Stack utility enables you to batch-convert DART 1.4 or Disk Copy files.
- Apple events support ("required" AE suite and custom 'cnvt' event.)
- System 7 "drag-and-drop" disk image creation.
- 32-bit clean.
- A/UX compatible.
- Color icons and balloon help.

Where to Obtain DART

-----

The current version of DART may be downloaded from two locations on AppleLink:

1) The Apple SW Updates board. Use the following AppleLink path:

Software Sampler  
Apple SW Updates  
Macintosh  
Utilities

2) On the AppleLink version of the Tech Info Library, posted as an enclosure to the article: "DART 1.5.3: Version Change History (10/93)"

Apple IIe: Best Way to Shut Down with Floppy Drive

=====

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Which of these is the better way to shut down an Apple IIe with a floppy disk drive?

- 1) Save the work
- 2) Wait until the in-use light is off
- 3) Remove the disk(s) from the drive(s)
- 4) Switch off the power

Or

- 1) Save the work
- 2) Wait until the in-use light is off
- 3) Switch off the power
- 4) Remove the disk(s) from the drive(s)

DISCUSSION -----

Both methods of shutting down will work without any problems most of the time. The safest procedure is to remove the disk before shutting down. You should do that just in case there is some freak signal sent through the drive that corrupts the diskette. This is very rare but does happen.

Apple Hard Drives: Internal To External

=====

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Do you know of any way to turn internal hard drives into external hard drives?

DISCUSSION -----

The mechanisms are no different, but here is what you will need to go through to be able to do it. Is is probably more trouble than it's worth.

- You will need to obtain an external hard drive case
- You will need to obtain a power supply for the external case
- You will need to obtain a different mounting bracket
- You will need to obtain an external SCSI cable and terminator

This is not an easy process, and probably not cost effective when including labor costs.

AppleScan: Can't Run from Read-only Server

=====

Article Created: 5 September 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I'm trying to set up a scanner operation to work remotely. How can I keep AppleScan on a read-only server and make it accessible to those logging on from a scanner at a remote site? (Both are running System 7.)

AppleScan is being "shared" from a Macintosh with "read only" status. Unfortunately, AppleScan needs to write a file when it is launched. An alias doesn't seem to work, because it still launches from the server.

DISCUSSION -----

Because AppleScan creates temporary work files in the folder where it is located, there is no way to make it work in a "read-only" situation. The application would need to be re-written with read-only file server operation in mind. The temporary files would need to be written to another location that is not read-only. In AppleScan, there is no method for designating where the temporary files will be written.

An alias does nothing to improve the situation because it simply points to the original application.

Two possible workarounds:

- Download the application from the server to the remote site and then execute the application at the remote site.
- Place the AppleScan software in a read-write location on the server.

## Macintosh Display Card 8•24: Benefits of ROM Upgrade

Revised: 7/6/92  
Security: Everyone

Macintosh Display Card 8•24: Benefits of ROM Upgrade

=====

Article Created: 5 September 1991  
Article Last Reviewed: 15 June 1992  
Article Last Updated: 5 February 1992

TOPIC -----

Can customers who have the older version of the Macintosh Display Card 8•24 upgrade to the new card for use with the new Macintosh 21" Color Display and the new 16" Color Display?

DISCUSSION -----

The upgrade is primarily for PAL timing capabilities. The original Macintosh Display Card 8•24 is capable of driving the Macintosh 21" Color Display, so there is no need to upgrade the ROM simply to use the Macintosh 21" Color Display.

The ROM Upgrade is needed to support the new 16" Color Display. The original 8•24 Display card does not support the 16" Color Display Apple announced in January 1992.

The ROM upgrade has another benefit: the ability to choose between 9300K (traditional Macintosh Standard White Point) and 6500K (Graphics Industry Standard White Point). If you need to choose the white point of your 21" Color Display, you can upgrade your card by purchasing the Service Upgrade kit (P/N 076-0548) through your service provider.

## System 7: Function of Backgrounder File

Revised: 9/11/92  
Security: Everyone

System 7: Function of Backgrounder File

=====

Article Created: 5 September 1991

### Article Change History

-----

09/11/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

What is the function of Backgrounder (on the System 7 Printing disk)?  
There's no Backgrounder on my hard disk, yet I can print to a LaserWriter  
IINTX successfully in the background.

### DISCUSSION -----

In System 7, the function of the Backgrounder is built into the Finder. You  
don't need the Backgrounder file at all if you're running System 7.

The Backgrounder file is, however, required on System 6.0.x systems that  
use System 7 printer drivers if they are to do background printing.

When you run the Installer on the 7.0 Printing Tools Disk from a 6.0.x  
system, the Backgrounder on that disk is installed on the 6.0.x system.

## NuBus: Recommended Board Placement for 24-bit Mode

Revised: 7/10/92  
Security: Everyone

NuBus: Recommended Board Placement for 24-bit Mode

=====

Article Created: 5 September 1991  
Article Last Reviewed: 10 July 1992  
Article Last Updated:

TOPIC -----

I've heard that the placement of NuBus boards in Macintosh IIci and IICx computers can affect memory use and performance under System 7. Is it true that the boards should be placed contiguously from left to right in Macintosh IICx computers, and from right to left in Macintosh IIci computers, to maximize memory performance?

DISCUSSION -----

RECOMMENDATIONS

Yes, there are recommendations as to where the NuBus cards should be placed. This has to do with heap fragmentation, not speed.

The following recommendations are valid only for 24-bit mode:

- The Macintosh IICx should have the cards placed from left to right.
- The Macintosh IIci should have the cards placed from right to left.
- Any Macintosh with six slots should have the cards placed contiguously from either side.

BACKGROUND

The memory map of any Macintosh running in 24-bit mode is 8MB for RAM, 1MB for ROM, 6MB for slot space, and 1MB for I/O. This is in order from bottom to top as follows:

|-----|

There may be more memory than the amount that shows up as the largest unused block, and thus the amount available for an application to be loaded into, because the memory is fragmented. Say, for example, you had a Macintosh IIfx set for 13MB with virtual memory, with a card in slot \$C. Applications were then loaded one after the other that took 7MB of memory combined. The largest unused block would be 3MB, even though there were 6MB of memory available to use, as only 3MB of it was contiguous. The 1MB below ROM, as well as the 2MB from slots \$D and \$E, could be used, but only as 1MB and 2MB chunks, respectively.

This is the same thing we see when multiple applications are launched, and then one of the middle applications is quit. The memory that the middle application used is not added to the largest unused block.

In the example below, three applications, each using 2MB of memory are loaded. Assume for this example that virtual memory is not on. If you then quit from application 2, the largest unused block would be 2MB, even though 4MB is not being used. If you load another application that used 1MB of memory, you would have 2MB as the largest unused block, because the 2MB on top is still available. This is the same issue as with the NuBus slots and virtual memory. When a card is placed in a NuBus slot, it is the same as having an application permanently loaded in that space.

With that in mind, on a Macintosh IICx, the NuBus slots used are \$9, \$A, and \$B. Therefore, if you fill \$9 first, which is right next to ROM, you have 5MB of contiguous slot address space. If you fill \$A first, you have two chunks, one of 1MB of contiguous slot address space, and the other 4MB of contiguous slot address space, and thus 4MB would be the largest unused block.

A Macintosh IICi uses slot \$B for video RAM. The NuBus slots used are \$C, \$D, and \$E. If you are using built in video, it doesn't matter which way you load the cards. If you are not using built in video, using slot \$E first would give you the most contiguous slot address space.

On a Macintosh with six NuBus slots, it does not matter which direction you fill the slots from, but to get the most contiguous space, they should be loaded one next to the other.

The ordering of the NuBus cards solely affects heap fragmentation. This has NO effect on the speed of virtual memory. Once you load the applications, the speed is the same regardless of where you place the cards. Heap fragmentation gives you less contiguous memory to load things in, but it does not affect the system's speed.

Remember, this is true only in 24-bit mode. Once you go to 32-bit addressing, the whole address map changes, and this is no longer an issue.

## MacX25 Version 1.0.1: Description

Revised: 9/20/91  
Security: Everyone

MacX25 Version 1.0.1: Description

=====

Article Created: 17 September 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

This article describes version 1.0.1 of MacX25 software, and gives some background information about communication software.

DISCUSSION -----

MacX25 Version 1.0.1

-----

MacX25 version 1.0.1 is updated software for linking Macintosh computers to packet-switched data networks (PSDN) supporting the international OSI and CCITT X.25 recommendation for enterprise-wide communication.

It is now available for Macintosh computers running System 6 or System 7, supporting any Macintosh as an X.25 client and all Macintosh II computers as servers. System 7 offers a range of services for networking, including file sharing and interapplication communication. To ease transition to using X.25 in the newer system software environment, MacX25 version 1.0.1 retains the same set-up configuration and does not alter the interface used in MacX25 version 1.0. Access to host computers and end-user services on the PSDN is distributed from a MacX25 server to Macintosh computers over the AppleTalk network system.

For improved communication with European networks, MacPAD (the client side of MacX25) now supports 8-bit characters. Support for 8-bit characters, in which such symbols as the German ä, French ç, and Spanish ñ are encoded, enables businesses on both sides of the Atlantic to transfer data files transparently and communicate in the appropriate European languages.

The new MacPAD also offers new features for flexibility in communicating across the X.25 network, including the ability to negotiate throughput

parameters and the size of packet windows. In addition, because it is implemented as a connection tool for the Communications Toolbox, MacPAD allows third-party applications, including terminal emulators, to connect to host systems over X.25 networks.

The MacX25 Programming Library, available separately for third-party developers, works in conjunction with the MacX25 server to provide X.25 access to applications. This enables developers to create Macintosh solutions giving users access to PSDNs. The library, which remains unchanged in the new version of MacX25, consists of a toolkit for such routines as initiating and terminating contact with the MacX25 server, establishing and closing down a virtual circuit, and passing data across an established circuit.

For example, an application developed in Italy uses tools in the MacX25 Programming Library to provide Macintosh-to-host access across an X.25 network. List SpA, headquartered in Pisa, developed a cost-effective interbank trading network for the Italian banking system that enables Macintosh computers in each bank to connect to the system's mainframe over the X.25 network.

The MacX25 version 1.0.1 Server kit also includes the MacPAD client software and updated documentation. A MacX25 version 1.0.1 upgrade is available for owners of MacX25 version 1.0. A Macintosh running the MacX25 version 1.0.1 server software requires an Apple Serial NB Card. The MacX25 Programming Library, used by developers of third-party X.25 applications for the Macintosh, remains unchanged.

MacX25 1.0.1 is available in the United States through APDA. Outside the U.S., MacX25 version 1.0.1 is available to developers through APDA and to end-users through Apple dealers. Search on "APDA and 800" to find the 800 numbers for contacting APDA.

The international version of MacX25 version 1.0.1, which will allow the English language version of MacX25 to run on foreign-manufactured Macintosh systems, will be available in Europe.

#### Background

-----  
Apple's MacX25 conforms to the Open Systems Interconnect (OSI) model and Consultative Committee on International Telephone and Telegraph's (CCITT) X.25 recommendation for communication with packet-switched data networks (PSDN). Because of their cost-effective use of leased lines to transmit information over long distances, X.25 PSDNs offer an increasingly popular means for electronic communication internationally.

MacX25 consists of server and client software. The MacX25 server software allows a Macintosh on an AppleTalk network to be set up as a single entry point to the PSDN. Server-based access reduces the cost of global connectivity by maximizing use of expensive resources, such as leased lines. MacPAD client software works in conjunction with the server software to provide packet assembler/disassembler connectivity to the PSDN.

MacX25 features a graphics-based administrator's application that facilitates configuration and administration of the server. An address service allows administrators to set addressing details on the Macintosh server.

Running the server component of MacX25 1.0.1 under System 7 requires 4MB of RAM; the client side needs 2MB. To run MacX25 1.0.1 server software with System 6.0.7 requires 2MB of RAM; the client side needs 1MB.

MacX25 supports the following standards and recommendations:

- CCITT X.25 1980 and 1984 versions
- Packet Assembler/Disassembler (CCITT X.3, X.28 and X.29)

AppleWorks 3.0: How To Set Privileges on Network

=====

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

With the network version of AppleWorks 3.0, how can privileges be set so AppleWorks users can't delete the program or necessary program files?

DISCUSSION -----

If Aristotle is not in use, within AppleShare you can assign a printer to a particular user. You also have the option to select a printer from the Chooser or to type the name. If the name chosen or typed in does not match the spooled printer's name, the printer won't be seen. We suggest verifying what the name of the printer for each user is.

You can set the folder privileges so the users have read-only rights. Don't give users the ability to make changes.

Security: Everyone

Apple IIGS: "AppleTalk must be installed" Error

=====

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I am trying to print AppleWorks on a LaserWriter from an Apple IIGS over AppleTalk. I downloaded "Apple IIGS: Printing to the LaserWriter from AppleWorks" from Tech Info on AppleLink. When trying to set this up by going into the Chooser, I get the error message "Error: AppleTalk must be installed to run this program."

DISCUSSION -----

The error message is a little misleading. The actual cause is an improper setting of the slots in the Apple IIGS Control Panel.

With the older Apple IIGS (256K of RAM on the logic board), you need to set Slot 1 to "Your Card" and Slot 7 to "Built-In AppleTalk". If you have a newer Apple IIGS (1MB RAM), set only Slot 1 to "AppleTalk". You'll have to restart after making the changes for them to take effect.

Aristotle: How To Exceed the 150 Application Limit

=====

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I'm working with Aristotle on an Apple IIGS school network and have 150 applications listed in our current menu. The Apple IIGS teacher workstation has 2MB of RAM installed.

I want to add additional applications to the network, but run up against the 150 limit. How can I create an additional menu while continuing to work under "Administrator"?

DISCUSSION -----

The Aristotle user manual has a 256K RAM card/cache set for initial setup. By increasing the amount of RAM card/cache, you should be able to exceed the 150 barrier that you encountered. The Users, Teachers and menu information are loaded into the RAM card/cache when you log on to the server.

## Macintosh: Bad F-line Instruction Error (11/95)

Revised: 11/20/95  
Security: Everyone

Macintosh: "Bad F-line Instruction" Error (11/95)

Article Created: 13 August 1991  
Article Last Reviewed: 20 November 1995

TOPIC -----

I am getting a "Bad F-line Instruction" errors on my 68k Macintosh computer.  
What causes these errors?

DISCUSSION -----

In System 7.x, the "Bad F-line Instruction" error is also referred to as the "Co-processor Not Installed" or "No FPU Installed" error; in System 6.0.7 it is referred to as the ID=10 error.

F-Line instructions are used to access attached processors, such as a floating-point math co-processor. A bad F-Line instruction is a bad Floating Point Unit (FPU) call. However, when you see this on computers without FPUs, or in applications that do not support an FPU, then it is probably a spurious error. These messages often indicate software related errors generated by a program that has extraneous program code. On very rare occasions a hardware failure generates these errors.

With System 6.0.7, these errors do not have a direct relationship with floating point co-processors; you will not resolve this error by installing an FPU. In System 7.x, there may be a problem with the math chip, or it may be an unrelated software error.

The error may be caused by bad code in the application which is calling a processor that is not present or calling a memory location that is not there. There may be a corrupted application or an extension causing some spurious memory problem.

A possible solution is to remove and reinstall the application and/or remove and reinstall the system software.

NOTE: On Power Macintosh computers, there may be additional causes to these

types of errors. See the Tech Info articles, "Power Macintosh Computers: No FPU Installed Error" and "Power Macintosh: Type 11 & No FPU Errors Technote" for additional information.

## Macintosh: Troubleshooting ID=01 Bus Error

Revised: 9/27/91  
Security: Everyone

Macintosh: Troubleshooting ID=01 "Bus Error"

=====

Article Created: 13 August 1991  
Article Last Reviewed: 21 July 1992  
Article Last Updated: 21 July 1992

TOPIC -----

I'm getting a lot of ID=01, "Bus Errors" on my Macintosh.

It has happened when I'm setting up disks (both floppies and external hard disks); it has happened with most of the programs I run; it has happened when I try to print. What does it mean?

DISCUSSION -----

ID=01, or "Bus Error", is one of the more common System errors, along with 02, 03, 10, 25, 28. The main reason you are seeing this type of error is that the programmers have changed their coding of errors from an ID-XX format to a "more helpful" word-based error. A Bus or Coprocessor Error can be caused by any application (including the Finder) trying to access any memory address in the F hexadecimal range, which accounts for approximately 50% of the address ranges in most Macintosh models.

These errors usually represent some sort of software incompatibility. It could be that the application is incompatible with the System version, a system extension or INIT (screen dimmer, startup screens, startup sounds, etc.) is conflicting with another extension, or the extension is incompatible with the System version.

There are three ways to reduce the frequency of this error:

- 1) First try removing all third party extensions (INITs) and control panels from your System Folder, as there may be a potential conflict there. (If running System 7, holding down the Shift key as the Macintosh starts up accomplishes this for the current session.) After restarting, if the Bus Error ceases, the problem is with a conflicting

extension or control panel, or perhaps a combination of them. Move these files back into the System Folder gradually, restarting between each move, until you identify the conflicting file.

- 2) Be sure the computer is free of ANY virus, but particularly the WDEF strain. System 6.0.7 has serious problems with WDEF, and in 90% of the cases we've seen these bus and coprocessor errors were caused by WDEF.
- 3) Throw away the current System Folder and reinstall from known good LOCKED disks.

Use your machine for a day or so before adding extensions or control panels back into the system to see if the same errors come up. If they come up only in certain applications, check with the software manufacturer to make sure you have the most current version, and whether they have seen or heard of the problems you are having.

There is a slight chance the errors are hardware related. If the software fixes don't work, try running diagnostics on the hardware. The following parts are the likeliest problem spots:

- RAM
- Logic board
- Hard drive

## EtherTalk Installation: How System 6.0.7 and System 7 Differ

Revised: 9/27/91  
Security: Everyone

EtherTalk Installation: How System 6.0.7 and System 7 Differ

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Will System 6.0.7 and System 7.x automatically install EtherTalk 2.0.2 as needed for a Macintosh IIfx?

DISCUSSION -----

System 6.0.7

-----  
System 6.0.7 does not automatically install the EtherTalk Drivers. You must use the Network Products Installer that comes with the computer. This correctly installs the Network CDEV and network drivers.

System 7

-----  
System 7 automatically installs network drivers and CDEVs -- if a network card is installed on the computer. If you find that some networking software you need is not installed, use the Installer program on your System installation disks and use the Customize option. The Customize option lets you install the specific software you want without disturbing the rest of your system.

Revised: 2/4/93  
Security: Everyone

System 6: Non-Opening Folder May Be a Memory Problem 2/93

Article Created: 13 August 1991

### Article Change History

02/02/93 - REVISED

- To indicate that this is valid for System 6 only.

### TOPIC -----

Is there a limit to the number of files that can be placed in a folder? I have over 1,000 files in a Data Club network folder, and it will no longer open.

### DISCUSSION -----

The maximum number of files and folders available on a hard drive is roughly limited to about 4.3 billion total, with a 64,000 file limit. If you're having a problem opening the files, it may be related to Finder memory allocation instead.

Do this:

- 1) Do Get Info on the Finder. (In the Finder, select the Finder file, then choose Get Info from the File menu.)
- 2) Increase the Application Memory Size by 100K.
- 3) If that doesn't work, increase the memory allocation by another 100K.

## ImageWriter 15-Inch: How To Improve Blurry Printing

Revised: 9/20/91  
Security: Everyone

ImageWriter 15-Inch: How To Improve Blurry Printing

=====

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have an ImageWriter 15-inch (wide carriage). When printing in "Best" mode the letters appear blurry.

When the printer puts down the second strike from the other direction during printing it is slightly off, giving the job a blurry look. (I have tried printing the same things with a narrow-carriage ImageWriter I and the print is much sharper.)

I've tried adjusting the carrier wire, replacing the logic board, drive transistor set, carrier motor, carrier wire, and print head, but none of these things helped.

Does the mechanical assembly just wear out after a time, producing a little "slop" that could cause this problem? Is there an adjustment for horizontal linearity? Is there a way to get unidirectional printing in the "BEST" mode?

DISCUSSION -----

Printers, like all mechanical devices, eventually exhibit symptoms of fatigue and general wear and tear. There is a point in every printer's life cycle where the cost to repair exceeds the cost of replacement.

Here's what you can do to help your ImageWriter 15-inch:

- 1) Perform the VR1 adjustment. This adjusts for optimum vertical alignment. This is more of a fine tuning adjustment but should be performed first.

- 2) Clean the Carriage Rails thoroughly. This means buff the rails and make sure they are clean all the way around. A quick wipe will not do the trick.
- 3) Check the carrier wire (Apple Part #970-0818 ) that attaches to the Carrier Assembly. Where the cable mounts to the carrier assembly, a small rubber bushing is used to isolate the Carriage assembly from the cable. As the printer ages, this rubber bushing may deteriorate. If that seems to be the case, order another bushing and see if that solves the problem.

Unidirectional printing in Best mode is not an available option.

MacX: Uses Standard Macintosh System Color Palette as Default

=====

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

When plotting a color bar of 256 colors in MacX, I get a full range of colors on the left side (colors 0 through 128 or so) but get only a solid color on the right (colors 128 to 256). When printed to a Tektronix color printer, the screen dump routine returns a error message "130 colors found". This occurs in both root and rootless windows.

The color bar is complete (256 colors) on both the screen and printer when running White Pine's Exodus II, and matches the color table of the host.

Why isn't MacX displaying all the colors like Exodus II?

DISCUSSION -----

There are many X client applications that use the standard or default X color map. MacX uses the standard Macintosh system palette as the default color map (which it should), and this can lead to the situation you describe because the System palette has 128 colors locked in and no additional colors specified.

If the X client application requests a new color map from MacX, it should get the full 256 colors it requests.

SCSI: Apple Supports Both SCSI Group 0 and Group 1

=====

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I understand that computers that use SCSI Group 0 set of commands on drives larger than 1.073742 gigabytes will, when they reach the 1.073742 limit, wrap around to the beginning of the disk, overwriting the first blocks.

I am also told that the SCSI Group 0 set of commands is in some Sun Microsystems -- and virtually ALL Apple -- operating systems.

If this is true, what is the solution if I want to have these large capacity drives? Are the vendors of these large drives responsible for providing a solution?

DISCUSSION -----

Apple's "driver" (software installed to the drive during HD SC Setup and uploaded to the memory during system boot) can be set up to use either 6 bytes (Group 0) or 10 bytes (Group 1) SCSI commands. Although they are using 6 bytes command currently, if the capacity of our drives goes beyond 1.2GB, then the driver can be changed to use Group 1 commands for those drives.

The Macintosh OS can allow different drivers to exist at the same time, so we don't have to change the driver for the current drives, just add the new driver when necessary. Incidentally, our current drives support both group 0 and group 1 commands, too.

Our driver currently supports Group 0, but can easily be modified to support Group 1 when necessary.

NOTE: Apple's driver only supports Apple hard drives. Third-party hard

drives require their own drivers.

## System 7.0: Put Away Problem Workaround

Revised: 9/11/92  
Security: Everyone

System 7.0: "Put Away" Problem Workaround

=====

Article Created: 13 August 1991

### Article Change History

-----

09/11/92 - REVISED

- To make more clear.

### TOPIC -----

I'm having a problem with System 7 when I follow these steps:

- 1) Drag an application to the desktop.
- 2) Select it and use the Put Away command on it.
- 3) Close the window the Application is in. Now double-click on any document for that application.
- 4) A message says the application can't be found.

### DISCUSSION -----

Here's a workaround: Don't use Put Away. Instead, drag the application to the desktop again, then drag it back to fix the problem. Rebuild the Desktop file.

## System 7: Unavailable Published Fonts Default to Geneva

Revised: 9/22/92  
Security: Everyone

System 7: Unavailable Published Fonts Default to Geneva

=====

Article Created: 13 August 1991

### Article Change History

-----

09/22/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

When a file is published, is its original format maintained? If I publish a paragraph of text with PostScript fonts, does the subscriber get PostScript fonts? What if he has different fonts, or only TrueType fonts?

### DISCUSSION -----

If the font that is used in the published document is not available in the subscriber's system, Geneva is used.

If the font is in the System folder, the subscriber's resident font format determines both screen and printer output.

## MacTCP: System 7 Compatibility Problems and Workaround

Revised: 9/26/91  
Security: Everyone

MacTCP: System 7 Compatibility Problems and Workaround

=====

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Is there a System 7-compatible version of MacTCP?

Since I've upgraded, I've lost my Ethernet connectivity and have to log on to the mainframe via Microphone II, which is very slow in a terminal emulating mode. I've also lost my FTP capabilities.

DISCUSSION -----

Although currently (August, 1991) MacTCP is not fully compatible with System 7, you actually can use MacTCP -- if you put it in the right place.

Take MacTCP out of your Extension folder and put it into the System folder itself. Since you are making your connection via LocalTalk, and since you cannot be running VM, you should be able to make a connection.

This is a workaround, but it should give you the same functionality you used to have until full compatibility with System 7 is available.

## TrueType: Combining Fonts Under Common Name in Font Menu

Revised: 7/27/93  
Security: Everyone

TrueType: Combining Fonts Under Common Name in Font Menu

Article Created: 13 August 1991  
Article Reviewed/Updated: 27 July 1993

TOPIC -----

I want to combine TrueType family of typefaces into one common name under the Font menu: for example, typefaces like Times-bold & Times-italic appearing under one name (Times) in the Font menu.

I have heard of utilities that do this for PostScript fonts (Fifth Generation Systems', Inc. Suitcase II/Font Harmony being one) and also resolve ID conflicts with different fonts. Is there something similar for TrueType?

DISCUSSION -----

The FOND resource is what makes it possible to have different styles of one font family show as one item in a font menu. The possible styles include plain and any combination of the following: bold, italic, underline, outline, shadow, condensed, and extended. Typically, the font styles you see are plain, bold, italic, and bold-italic. Sometimes you see a condensed font. This mechanism is not intended to combine AvantGard-Demi and AvanteGard- DemiOblique under the same font menu item.

Modifying a FOND resource to support more font styles is not something we recommend, as it is rather tricky. However, if you want to try, please read Macintosh Technical Note #198 and Inside Macintosh Volume IV, chapter 5, specifically page IV-39. These documents provide the information you need to attempt this.

We contacted Fifth Generation Systems, Inc., who told us their Font Harmony product does not currently support TrueType fonts.

AppleShare: Suggestions for Expanding Beyond 50 Users

=====

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have 35 computers on my AppleShare network and need to add 20 workstations. I have a star controller. Do I need to divide the network into zones? Do I need to add a bridge? Do I need to add another file server?

DISCUSSION -----

If you go over the 50-user limit, not everyone will be able to log on to your server at the same time and the network will slow down.

Another AppleShare file server is needed. We also suggest you add an Apple Internet Router that runs in the background on the servers. This will enable you to break up your network into logical zones. Each Internet Router supports two LocalTalk networks. You also might want to consider using an Ethernet backbone between the servers to speed things up.

Security: Everyone

Aristotle: Troubleshooting Menu Management "File Already Open."

=====

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have an AppleShare network with Apple II workstations and a Macintosh file server. My problem is with Menu Management in Aristotle. After I make changes in menu.m and I try to save changes, I get the error "File already open." Even after repeated tries, I still get this error and must quit without saving my changes.

DISCUSSION -----

The problem may be with the Access Privileges in the Administrator's ESP folder.

Aristotle's menu management program creates folders named ESP that are stored within individual users' folders on the server's startup volume. In order for Aristotle to work correctly, access privileges must be set up in a certain way:

- 1) Open AppleShare Admin.
- 2) Display the list of folders.
- 3) Open the Users folder.
- 4) Open the appropriate user's folder.
- 5) Display the access privileges on the ESP folder.
- 6) Ensure that all boxes in Access Privileges are checked EXCEPT "Make Changes: Everyone".

7) Make sure that Teacher appears in the Group box.

AppleWorks: Landscape Printing on LaserWriter Not Supported

=====

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I'm using a LaserWriter Plus with an Apple IIe and AppleWorks 2.1. I can print to the LaserWriter using either Diablo emulation or the IWEM ImageWriter emulator. (This is a stand-alone configuration, with the Apple IIe printing through a Super Serial Card.)

- 1) Can the Diablo emulation mode print sideways?
- 2) Can I change IWEM for landscape printing, or could AppleWorks be used to send a PostScript "setup string" to the LaserWriter to prepare it to print sideways?

DISCUSSION -----

Landscape LaserWriter printing is not supported using Diablo 630 emulation, just as it is not feasible on a Daisy Wheel Printer. The daisy wheel would need another print head to handle the 90 degree rotation of print.

As far as altering the IWEM to print landscape, this is theoretically possible but we know of no easy way to do this. It would involve a fair amount of PostScript programming changes to the IWEM.

Macintosh: Troubleshooting Frequent Hard Disk Access Light

=====

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

My hard drive access light comes on every 15 seconds or so, blinks as if it is accessing a file, then stops. This happens all the time. What's going on?

DISCUSSION -----

This behavior is most likely caused by a third-party INIT or CDEV, such as On Location, rather than by a hardware problem. An easy test is to start up your system with a known-good System floppy disk. If the symptoms persist, then you may have a damaged hard drive -- though the problem is most likely in software.

Macintosh Portable: Tips for Long-Term Storage

=====

Article Created: 13 August 1991  
Article Last Reviewed: 29 July 1992  
Article Last Updated:

TOPIC -----

If I use my Macintosh Portable only once every three months, how should I treat the battery: do nothing or keep the charger attached?

DISCUSSION -----

The Macintosh Portable battery is a sealed lead-acid battery and must be recharged periodically in order to maintain normal battery life. If the battery falls below 5.4 volts, it cannot be recharged.

To prevent the battery from completely discharging, keep it plugged in to the Battery Recharger, or leave the Macintosh Portable plugged in to the power adapter whenever possible.

When neither of these methods is possible, observe these precautions for recharging and storing the battery:

- Do not leave the battery in the Macintosh Portable for longer than TWO WEEKS without plugging in the power adapter.
- If you store the battery, recharge it overnight before storing it, then store it in a cool, dry place.
- Do not leave a battery in storage for longer than SIX MONTHS without recharging it.

Failure to follow these steps for recharging and storing the battery will result in a dead battery that CANNOT be recharged and will need to be replaced.

Desk Accessories: Troubleshooting Inappropriate Fonts (9/94)

=====

Article Created: 13 August 1991  
Article Reviewed/Updated: 15 September 1994

TOPIC -----

When opening the Chooser to select a LaserWriter, the LaserWriter appears, but with its name displayed in the Cairo typeface.

DISCUSSION -----

If everything else on your system seems to be working, something is probably wrong with your Chooser desk accessory. (This can also happen to desk accessories like the System 6.0.x Find File, and so on.) The information about the LaserWriter coming in over the network doesn't have font information. If your other modeless dialog boxes are working, then the problem must be with the information compiled and generated by the Chooser.

There are several repair options here, depending on exactly where the problem is:

- Reinstall Chooser (with Font/DA Mover if your System is earlier than System 7).
- Reload all System fonts from original disks.
- Reinstall the System file with Installer.
- Zapping the PRAM (under System 6.0.x or 7.x) doesn't usually work.
- Reinstalling the system software (6.0.x or 7.x) doesn't always work.
- Run the shareware control panel ApFont to reset your system file default font (normally Geneva 12) This usually fixes the problem.
- Delete the entire System folder, then reinstall with Installer.

The last option is the most drastic, but also has the greatest probability of fixing the problem the first time.

You can obtain ApFont from AppleLink.

## Apple Peripherals & Drivers: Advantage over Third-Party Products

Revised: 9/26/91  
Security: Everyone

Apple Peripherals & Drivers: Advantage over Third-Party Products

=====

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

What's the advantage of using an Apple printer instead of one from another manufacturer?

DISCUSSION -----

The Macintosh operating system uses drivers for connecting peripheral devices such as printers. At this time, Apple provides drivers only for its own peripherals, not for third-party products.

Some third-party developers have opted to create drivers for non-apple printers. In most cases these drivers work well. Not all printers or drivers have the same capabilities that our drivers and printers have, while others may have more.

Most software developers develop their software to be compatible with our drivers, but not necessarily with third-party drivers. By sticking with Apple products, you are assured a greater compatibility with off-the-shelf software.

Security: Everyone

CloseView: Conflict Display Cards 4•8, 8•24, 8•24 GC & System 6

Article Created: 13 August 1991  
Article Last Reviewed: 9 June 1992  
Article Last Updated: 9 June 1992

### TOPIC -----

I'm having intermittent crashes that seem to be related to the CloseView control panel. I am running System 6.0.x. I frequently need to use CloseView, and my Macintosh crashes almost always when using CloseView.

### DISCUSSION -----

There is a known anomaly with CloseView versions prior to 7.0 (that is, those versions before System 7) and the Macintosh Display Cards 4•8, 8•24, and 8•24 GC in the NuBus Macintosh. Your symptoms are typical of this anomaly. The only workaround for using CloseView with these cards is to upgrade to System 7.

CloseView behaves gracefully under System 6 in other Apple-supplied video environments: Macintosh Classic, Macintosh IIsi built-in video, Macintosh IICx built-in video, Macintosh LC built-in video, Macintosh Plus, Macintosh SE, Macintosh SE/30, Two-Page Display Card, Portrait Display Card, and Macintosh II Video Card. We have no data regarding third-party video cards.

The version of CloseView that ships with System 7 is compatible with the 8•24 style of video cards. Users wishing this functionality are encouraged to upgrade to System 7.

Note that though in very brief testing we didn't encounter any problems using CloseView version 7.0 on Macintoshes running System 6.0.x having an 8•24 video card, Apple did not formally test this configuration nor is this a recommended configuration.

An alternative is to use third party CloseView-like programs, such as Stepping Out from Berkeley Systems, Inc. For more information, search under Berkeley

Systems.

Daystar PowerCard: Prevents Start-Up from High-Density Floppy

=====

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Can a Daystar 50MHz PowerCard affect SCSI transfers? Does the PowerCard's processor speed adversely affect the SWIM chip upgrade?

DISCUSSION -----

The Daystar 50MHz PowerCard should not affect SCSI transfers.

The SWIM chip that controls floppy drives should not be affected except for one minor problem: you can't start up from a high-density floppy because the accelerator card requires an INIT in order to use high-density disks. High density disks can't be used as startup disks because the INIT must be loaded first.

AFE 1.4: 8•24 GC Acceleration Problem

=====

Article Created: 13 August 1991  
Article Last Reviewed: 15 June 1992  
Article Last Updated: 15 June 1992

### TOPIC -----

Apple File Exchange will not make a clean transfer of data to IBM format when the Macintosh Display Card 8•24 GC's acceleration is on. AFE works okay when the accelerator is turned off.

### DISCUSSION -----

This is a known issue with version 1.4 of AFE. The problem occurs with AFE when the Macintosh Display Card 8•24 GC graphic acceleration is turned on and may cause the system to hang, especially when formatting or erasing disks.

The problem does not exist with version 7.0 of AFE. However, AFE 7.0 has only been tested with System 7 and the 7.0.1 version of the 8•24 GC software. The current solution for System 6 users is to turn off graphics acceleration when using disks with AFE 1.4.

## AppleFax Modem: Explanation of Transfer Speeds

Revised: 9/26/91  
Security: Everyone

AppleFax Modem: Explanation of Transfer Speeds

=====

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

The AppleFax Modem's specifications state that it can send at 9600bps, and slower speeds -- presumably to other similar modems' speed.

Is there any detailed information about this modem and the speed at which it transmits files under different conditions?

DISCUSSION -----

The specification you're requesting don't really exist as true benchmarks, as there are too many variables inherent in any data transmission. Most communication hardware specifications cite baud rates and bps ratings, and use that as the basis of comparison with other products.

The AppleFax Modem is an often misunderstood product. It is a Group 3-compatible facsimile device, and communicates with other AppleFax Modems at 9600bps in a modem-like fashion. It's important to note the latter point, as many users mistakenly believe that it also functions as a standard modem.

As far as fax transmission goes, the Group 3 protocols call for extensive error checking, which slows data throughput. In addition, Group 3 fax machines automatically lower their transmission rates based on the noisiness of the phone line. These two factors often make the fax modem appear to be transmitting slower than it actually is.

Macintosh: Basic Troubleshooting for Font Problems

=====  
Article Created: 13 August 1991  
Article Last Reviewed: 29 July 1992  
Article Last Updated: 29 July 1992

### TOPIC -----

I'm suddenly having problems with the font in one of my Macintosh applications. The font is breaking up and looks like there is no printer font installed. I've reloaded the program, resources, fonts, everything -- but no change.

### DISCUSSION -----

In general, font problems can be traced to either corrupt system resources or to a corrupt application. Here is a short troubleshooting procedure you can try to determine which of the two it may be:

Start up the computer with a known good System Tools or Disk Tools startup diskette (one which contains a complete System Folder). This effectively eliminates any conflicts you may be having with system extensions or control panels in your main System Folder. If this solves your problem, then go back to your main System Folder and move all items that did not come with the original system software to another temporary folder, moving one item back in at a time until you diagnose which caused the conflict.

One other possible problem is duplicate System Folders. Your Macintosh may be "switching" to another System on your hard disk and you aren't aware of it. You think you're modifying and testing one System Folder, but your Macintosh is actually using the other System.

Use the Find File desk accessory (or System 7's Find command) to search for multiple System Folders. If you find more than one, trash all but the active System Folder. If that remaining System Folder is still a problem, then move any items from it you want saved to a holding folder and drag the remainder of the System Folder to the trash. Then start up from an

Installer disk and reinstall the system.

Macintosh IIfx: Two Internal Hard Drives Not Supported

=====

Article Created: 13 August 1991  
Article Last Reviewed: 14 July 1992  
Article Last Updated:

TOPIC -----

I have a Macintosh IIfx with two internal 3.5 SCSI drives. The drives are daisy-chained, with the last drive having a terminator and the first one without. I also have an external SyQuest drive with internal termination and a short cable.

I'm concerned that somehow this setup will not work with the Macintosh IIfx and its different bus impedance.

It looks to me like:

- 1) I need to remove internal termination of SyQuest and use a Terminator II.
- 2) I need to keep the internal drives the same but add a noise filter, probably at end of internal daisy chain on drive which has termination.

Am I right?

DISCUSSION -----

Your configuration is not an Apple-supported solution. We advise removing the second internal hard drive, particularly with the Macintosh IIfx and its exact termination requirements.

You have the right idea about what it takes to make this work. The termination needs to be augmented with a SCSI Filter on the last internal hard drive and a Terminator II installed on the last external device (and no internal termination).

Macintosh Hard Disk 20: How To Verify HFS Formatting

=====

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

How do I get a Macintosh Hard Disk 20 to format as an HFS volume?

DISCUSSION -----

Select the Macintosh Hard Disk 20 volume and choose Erase Disk in the Special menu.

You can to see if formatting was successful if there are the two thin lines near the top of the disk window. If you see a one-pixel dot at the left side of those two lines, it is an HFS volume.

Macintosh XL: Memory Upgrades

=====

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Are there any Apple memory upgrades available for the Macintosh XL?

DISCUSSION -----

When the Macintosh XL was available, Apple used 512K memory boards, of which two were supported in the system. AST used to manufacture 1MB memory boards, but they have since discontinued that product.

Sun Remarketing is an excellent source for support on the Macintosh XL. They also carry outdated third-party products for many discontinued Apple products. They may have some of those AST board in stock.

On AppleLink, you can find contact information on a company mentioned in this article by clicking the "Library Index" button in the lower-center of the Tech Info Library search window, then opening the "Third Party Company Directory" folder.

LaserWriter: Improving the Speed of a Shared LaserWriter

=====

Article Created: 29 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have a 15-node TOPS network with a shared LaserWriter IINT. I'm not happy with the printing speed across the network and I'm considering upgrading to a LaserWriter IINTX. Most of the documents we print are 1 to 4 pages with only 3 to 4 fonts. Is the bottleneck the LocalTalk speed, or could a LaserWriter IINTX significantly improve printing speed? Can you tell me how a LaserWriter IINTX could increase speed, and how much improvement to expect?

DISCUSSION -----

Upgrading to a LaserWriter IINTX will definitely help performance some, but it's important to consider other factors that may also help. The principal items that affect printing to a PostScript LaserWriter with a given application (not necessarily in this order) are:

- The LaserWriter's CPU performance.
- The type of print job: complex graphics or text.
- Whether the required fonts are resident in the printer or need to be downloaded.
- The type of connection to the host: serial or LocalTalk.
- The host's performance: how fast it can prepare and send data.

The environment may also play a major role in printing performance. Connection to a LocalTalk network adversely affects the performance of many LaserWriters if that network is used for file services such as an

AppleShare File Server or TOPS installation. The LocalTalk bandwidth can be used up, resulting in poor network and printing performance.

From what you've told us about your installation, it doesn't sound like upgrading to a LaserWriter IINTX will help much. You may see a mild improvement in print speeds, but unless you print complex graphics as well as text, you won't see a dramatic change.

The type of Macintosh, the system software versions, and the applications you use can affect speed quite a bit.

Printing slows down if you repeatedly use fonts (TrueType or PostScript) that must be downloaded. If this is the case, we recommend that you make a habit of downloading the most frequently used fonts to the LaserWriter with the LaserWriter Font Utility. Downloading fonts once between power cycles instead of for each print job improves speed on both the LaserWriter IINT and IINTX.

The LaserWriter IINTX does have the advantage of optional memory upgrades for additional fonts and performance. A hard disk is also available for the LaserWriter IINTX to download fonts only once.

Apple HD Setup: Why 80MB Drive Formats to Only 76.8MB

=====

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I've noticed that the new Apple 80MB internal drives only format to 76,800 Kbytes usable! Is there any reason for this? (The old drives formatted to the entire 80MB.)

DISCUSSION -----

Earlier versions of HD Setup initialized a volume to its maximum formatted capacity. Drives of similar advertised capacity have slightly varying total formatted size.

The release of the Apple Tape Backup unit lets you do a mirror-image backup of your drive. But in order to restore a mirror image backup, the volume that is being restored to must be of like or greater capacity than the volume from which the data came.

If, for instance, you had a failing hard disk that could be formatted to 78MB, did a mirror-image backup, had the drive replaced with one that could be formatted to only 76MB, you wouldn't be able to restore your work.

Apple modified HD Setup so that it formats each series of drive we sell to a like-total formatted size for that series, regardless of vendor. In the case of the nominally 80MB drive, 76MB is the lowest common denominator of all vendors that we use.

You may be able to reclaim some of the unused 4MB by using a third-party initialization application, but this is not guaranteed nor supported by Apple.

Macintosh: Troubleshooting Invisible Folders Problem

=====

Article Created: 13 August 1991  
Article Last Reviewed: 20 May 1992  
Article Last Updated: 20 May 1992

### TOPIC -----

When opening a Macintosh-formatted floppy disk from within Microsoft Works to select a file, no folders appear. But the folders appear normally in the Finder directory. The files are all available, but the folders on the disk are invisible. How can we get the disk back to normal?

### DISCUSSION -----

1) It's possible that the disk directory got corrupted, causing the problem you are seeing. Rebuild your Desktop by holding down the Command and Option keys while inserting the diskette. Run Disk First Aid to repair any directory damage.

2) Someone may have made the folders invisible. Use a utility such as ResEdit or Symantec Utilities to check this.

3) If running System 7.0 or 7.0.1, make sure to obtain System 7 Tune-Up version 1.1.1 or greater. Running Tune-Up 1.1.1 or greater will prevent a problem from occurring where folders and files begin to disappear from the desktop, but are in fact still intact and available.

## System 7: Can't Run from Single 800K Floppy Disk

Revised: 9/26/91  
Security: Everyone

System 7: Can't Run from Single 800K Floppy Disk

=====

Article Created: 13 August 1991

### Article Change History

-----

08/18/92 - CORRECTED

- To clarify that a high density (1.4MB) startup floppy is possible.

### TOPIC -----

Is there a way to create a bootable floppy of System 7?

If not, what is Apple's recommendation for doing diagnostics in the event of a system hang on startup or a hard disk crash?

### DISCUSSION -----

It is not possible to create an 800K system startup floppy disk, though a high density (1.4MB) floppy will hold a minimal System 7. For those Macintoshes that have an Apple (FDHD) SuperDrive, making a bootable floppy is simply a matter of running the System 7 Installer program, choosing customize, and selecting "Min System" for your Macintosh model.

The initial recommendation for troubleshooting System 7 is to hold down the Shift key on startup to temporarily disable any system extensions (INITs). Some other suggestions for system software troubleshooting:

1. Attach an external hard drive that has System 7 on it and set startup. Make sure this hard drive has appropriate and latest virus checkers installed.
2. Run standard hardware diagnostics to check the hardware.

3. Completely replace the System 7 software if removing the system extensions doesn't help. This is where it might be useful to have a 1.4MB startup floppy, so that you can at least get to the hard disk to remove the damaged system files and set aside other files you want to save.

## Macintosh: Explanation of About This Macintosh... (10/93)

Revised: 10/7/93  
Security: Everyone

Macintosh: Explanation of "About This Macintosh..." (10/93)

=====

Article Created: 13 August 1991  
Article Reviewed/Updated: 7 October 1993

TOPIC -----

When I choose "About This Macintosh..." from the Apple menu, I get information about my computer's memory and how it's being allocated. When I look at how much memory my applications are using, I typically see a grayed bar that's fully or partially filled by a black bar. Sometimes the black bar moves around.

What do the black and grey bars indicate? I've always thought that the gray was for how much memory the program had reserved for itself and that the black was how much memory it was currently using.

DISCUSSION -----

The total bar (black + gray) equals the amount of RAM allocated to the application, with the black portion indicating the amount of RAM currently used by that application. Technically, the program would have to use the operating system's memory manager for the black portion to be completely accurate, and some programs don't do that. The black portion fluctuates in proportion to actual RAM in use.

Notes: Under System 6.0.x, you get the same information with the "About The Finder..." item under the Apple menu.

Under System 7.x, you can get an "About The Finder..." choice under the Apple menu instead of "About This Macintosh..." by holding down the Option key. When you select this menu item, you'll see the mountain Finder graphic.

Performa systems display the same information with the "About This Computer..." item under the Apple menu.

Article Change History:

7 October 1993 - Changed the title and added notes to indicate the titles of the same menu item under different systems.

## Macintosh: Don't Split ADB Signal

Revised: 6/1/92  
Security: Everyone

Macintosh: Don't Split ADB Signal

=====

Article Created: 13 August 1991  
Article Last Reviewed: 22 May 1992  
Article Last Updated:

TOPIC -----

Some of the newer Macintosh computers, like the Macintosh IIsi, have only one ADB port in the back. This can be quite limiting; two ADB ports would be much better.

Can I make up my own ADB "T" plug or "Y" cable, so that two ADB female connections would be provided from the one port? Will the two ADB devices interfere with each other?

Another way to phrase the question: on a Macintosh with two ADB ports on the back, does each port come off a different and separate part of an interface chip, or are the two connections "common", so that pin 1 on connector 1 is connected to pin 1 on connector 2?

DISCUSSION -----

We do not recommend splitting the ADB signal, as it could cause problems with signal integrity. The signal is not very strong, and if split would be even weaker.

On a Macintosh with two ADB ports, both ports both go to the same ADB controller chip, but are physically separated to deliver the full signal down the bus.

Macintosh: How To Make "Curly" Quotation Marks

=====

Article Created: 13 August 1991  
Article Last Reviewed: 8 June 1992  
Article Last Updated:

TOPIC -----

My Macintosh (using New York font) makes quotation marks angled only one way. How can I produce the opposing quotation mark?

DISCUSSION -----

Here's how to produce "curly" quotes from the Macintosh keyboard:

|           |                |
|-----------|----------------|
| for this  | press          |
| character | these keys     |
| -----     | -----          |
| "         | Option-[       |
| `         | Option-]       |
| "         | Option-Shift-[ |
| '         | Option-Shift-] |

Some word-processing applications (MacWrite is one) can be set to automatically produce the appropriate "curly" quotes when you type ' or ".

Here's how to use the Key Caps desk accessory to see what characters are available to you:

- 1) Once you select Key Caps from the Apple menu, you see a display of all characters available in the current font -- actually, all those you can produce without using the Shift, Command, or Option key.
- 2) To see what characters you can make with various combinations of the Shift, Control, and Option keys, just press those keys on the keyboard.

3) To change to another font, select it from the Key Caps menu.

Apple PC 5.25 Drive: Troubleshooting Slow Disk Recognition

=====

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

My Apple PC 5.25-inch floppy takes about a minute for an inserted 5.25-inch disk to be recognized by my Macintosh. Is this normal?

DISCUSSION -----

It depends on the amount of information on the MS-DOS diskette, but there are probably some other factors involved to bring the access time to a full minute. More than likely there are other INITs, CDEVs or applications (if you're running under MultiFinder) that are stealing CPU time away from Apple File Exchange. You can easily check this by starting up with a floppy under Finder-only and launching AFE.

Another possibility is that AFE is running out of memory. If you're running MultiFinder, try boosting the RAM allocation by 200K or so.

Macintosh: Vibration Tolerance (11/94)

=====  
Article Created: 30 August 1991  
Article Reviewed/Updated: 10 November 1994

TOPIC -----

What are the limits of vibration tolerated by Macintosh computers?

DISCUSSION -----

The most sensitive components in a Macintosh system are:

- 1) the floppy disk drive, and
- 2) the hard drive.

Here are the vibration limits for floppy drives:

- Operating Limit: 5 Hz - 500 Hz at Max. .5 G
- Non-Operating Limit: 5 Hz - 500 Hz at Max. 2 G

For vibration limits of hard drives, perform a search on the hard drive itself.  
The specifications for the drive will state its vibration or shock limit.

Networks: Selectively Securing Zones and Devices (6/94)

Article Created: 29 August 1991  
Article Reviewed/Updated: 29 June 1994

TOPIC -----

Is there any product available that will allow a network administrator to hide zones or services on a selective basis?

I have two divisions on a single network that want to keep their printers separate. Each zone contains printers from only one division.

DISCUSSION -----

There are several products available to isolate a LaserWriter. Some are hardware, some are software, but most work on the level of zones, hiding devices within a zone to the entire Internet.

There are several options available to allow zone and device hiding, some are LocalTalk-to-Ethernet routers, and some are Ethernet-to-Ethernet routers. To locate a vendor's address and phone number, use the vendor name as a search string.

Apple Internet Router

Apple Internet Router supports three "families" of access methods: AppleTalk, half-routing, and tunneling. Each family may include more than one specific access method. For example, LocalTalk, EtherTalk, and TokenTalk are all AppleTalk access methods.

One of the more interesting features of Apple Internet Router is device hiding, which lets you select any device or devices on your local network to be hidden from users on other networks. Device hiding is configured in the "Hide Devices..." dialog, which is accessed by clicking the "Hide..." button in the Port Info window.

You can elect to hide no devices, all devices, only a specific list of devices,

or all devices except a specific list. You can hide your selection from all other ports or from a specific other port.

The administrator must use good judgment when setting up the list of hidden devices (or the list of not hidden devices). If the list contains more than a few devices, it will adversely affect performance.

In order for device hiding to be effective in a loop environment, all routers on a given network must hide the same devices. Otherwise, a "hidden" device would be accessible through another router that isn't hiding it.

Device hiding is not foolproof. Users could obtain a hidden device's AppleTalk address through some means other than looking for it on their network, such as running Inter•Poll on a portion of the internet that does have access to the device. Armed with that information, a user could access the device programmatically, even though the device is theoretically hidden.

#### AppleTalk Router Security Features: LocalTalk-to-Ethernet Routers

-----  
Cayman Systems GatorBox

Zone filtering prevents users in the filtered zone from seeing other zones on the network. This also prevents users in zones outside of the filtered zone from seeing devices in the filtered zone.

Laser filtering is, in a sense, a subset of zone filtering. Where the zone filtering shields all of the devices from the outside, laser filtering allows you to hide only LaserWriter printers from anyone outside of its AppleTalk zone. This also prevents users in the filtered zone from seeing LaserWriter printers in other zones.

Tilde filtering allows you to hide any device with a tilde character (~) at the end of its name from being seen by anyone outside of its zone.

Shiva FastPath

The Stay in Zone option prevents users in the filtered zone from seeing other zones on the network. This also prevents users in zones outside the filtered zone from seeing devices in the filtered zone.

LaserWriter Security is, in a sense, a subset of zone filtering. Where the zone filtering shields all of the devices from the outside, laser filtering allows you to hide only LaserWriter printers from anyone outside of its AppleTalk zone. This also prevents users in the filtered zone from seeing LaserWriter printers in other zones.

Tilde Security allows you to hide any device with a tilde character (~) at the end of its name from being seen by anyone outside of its zone.

NRC 2000

The Insecure option allows you to define sections of your Internet as insecure. Insecure network's routing information is not propagated to any other section of

the network, thus providing a way to control who can and cannot access the secure sections of the Internet.

#### APT

APT Communications announced an update to their AppleTalk routers. They now support device security across zones. Users can, for example, hide their LaserWriter from anyone not in their zone. You can hide other devices, such as file servers and NetModems.

You can allow other users on different zones, different sets of access to different devices. For example, Zone A may have no access to your LaserWriter, but still have access to a File Server, while Zone B has access to all LaserWriter printers, but not AppleTalk ImageWriter printers or NetModems.

APT routers connect multiple LocalTalk, Ethernet, WAN, and Serial networks and support Phase II AppleTalk.

#### AppleTalk Router Security Features: Ethernet-to-Ethernet Routers

-----

##### NRC Multigate Macintosh

The Insecure option allows you to define sections of your Internet as insecure. The Insecure network's routing information is not propagated to any other section of the network, thus providing a way to control who can and cannot access the secure sections of the Internet.

##### Cisco (CGS/MGS/AGS)

The Cisco router offers the ability to set up access lists that allow controlled access to your network. Access lists are set up to filter all inbound network traffic from any network listed in the access list. It excludes traffic from networks listed in the access lists from your network. Traffic from your network is still propagated to all other segments of your Internet.

##### International Transware (InterTalk)

This is a 2-port LocalTalk router that lets the user create blind and private zones. Users in a blind zone cannot see or use the resources of the AppleTalk Internet, but users outside of the blind zone can see and access any of the services in the blind zone. Private zone users have access to the entire Internet, but users outside the private zone cannot see or access any of the services of the private zone.

##### NetCounter

-----

NetCounter limits use of a LaserWriter by using the user name as specified in the Chooser for all accounting and access control. Therefore, NetCounter does NOT provide a secure environment against knowledgeable users who are motivated to circumvent the NetCounter controls. The security can be increased to some degree by removing the Chooser Desk Accessory, if the Chooser is not required.

NetCounter is an application that downloads PostScript code to PostScript printers. Thus, NetCounter does NOT support QuickDraw printers such as the LaserWriter IISC. Because the accounting code executes on the printer rather than on the Macintosh, you install the NetCounter application only on the administrator's Macintosh, not on each Macintosh on the network.

The NetCounter code and log data normally reside in the printer memory. Therefore, in the event of a power failure or printer reset, the log data in the printer memory is lost. A Macintosh running NetCounter can request transfer of log data from the printer to the Macintosh, so the administrator can limit the amount of information lost in the event of a power failure. If the printer has a hard disk attached (like a LaserWriter IINTX with hard disk), the log data is automatically saved to the hard disk, so that no information is lost in the event of a power failure. If the printer has the new PostScript ROMs installed (such as M0445LL/A LaserWriter IINTX Upgrade Kit or M6215/A Printer), you can install the NetCounter PostScript code on the printer's hard disk. This allows NetCounter to start up automatically after a power failure or whenever the printer is turned on, and the code does not need to be manually downloaded. This is the recommended configuration.

Within the constraints described, NetCounter offers the following features:

- Provides a count of the number of pages printed by each user.
- Provides two different approaches to control access to the printer:
  - Grant access to specific users (deny all other users).
  - Deny access to specific users (grant access to all other users).
- Provides miscellaneous control and display of printer parameters  
For example, enable/disable printer startup page, or set the manual feed timeout.
- Prevents the PostScript Trojan horse (which changes the printer's password) from infecting the printer while NetCounter is running.

NetCounter can control multiple printers, but it is awkward, with the current version, to specify a different access control list for each printer.

System 7: DesignCAD 2D/3D Compatibility

=====

Article Created: 19 September 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Is DesignCAD 2D/3D, from DesignCAD, Inc., compatible with system software version 7.0?

DISCUSSION -----

DesignCAD 2D/3D works with system software version 7.0 except on the Macintosh Plus, Macintosh SE, and Macintosh Portable. On these Macintosh models, DesignCAD 2D/3D fails to recognize the presence of 32-bit QuickDraw, which is built into version 7.0, and gives the user a message to install 32-bit QuickDraw.

At this time, there is no known workaround.

On AppleLink, you can find contact information on a company mentioned in this article by clicking the "Library Index" button in the lower-center of the Tech Info Library search window, then opening the "Third Party Company Directory" folder.

09/11/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

I received an out-of-space error message when I tried to copy some folders to another disk even though the available disk space was more than enough to hold the folders I was moving.

### DISCUSSION -----

When you copy folders with custom icons to another disk, the sizes of the invisible icon files are not included in the total folder size. This can result in the out-of-space error message you received.

## PrintMonitor Alerts: Conflict with LW Manual Feed (11/94)

Revised: 11/10/94  
Security: Everyone

PrintMonitor Alerts: Conflict with LW Manual Feed (11/94)

=====

Article Created: 19 September  
Article Reviewed/Updated: 10 November 1994

TOPIC -----

I use manual feed to print to my Personal LaserWriter SC with background printing turned on. After the print job is finished, I get a dialog box stating, "Please bring PrintMonitor to the front. The Personal LaserWriter SC is waiting for a sheet of paper." If I insert a sheet of paper, I get a second printout of the last page printed, whether it's a 1-page or multi- page document.

Sometimes it asks for another sheet of paper over and over in an endless loop; other times, it asks only once or twice. Occasionally, if I load an extra sheet of paper before printing, I don't get this message and the page prints fine.

DISCUSSION -----

This is related to the PrintMonitor default Preferences settings. To correct the problem, use this procedure:

- 1) Launch the PrintMonitor application.
- 2) Choose Preferences from the File menu.

A Preferences window appears with three section:

- Show the PrintMonitor window when printing:
  - o Yes
  - o No

The default is No.

- When a printing error needs to be reported:

- o Only display diamond in Application menu
- o Also display icon in menu bar
- o Also display alert

The default is to show all displays.

- When a manual feed job starts:

- o Give no notification
- o Display icon in menu bar
- o Also display alert

The default is to give notification and display both icon and alert.

- 3) In the "When a manual feed job starts:" section, click the "Give no notification" button.

If you still have the problem after you've made this adjustment, change the settings in the "When a printing error needs to be reported:" section to "Only display diamond in Application menu" by clicking that button.

This problem seems to be caused by a conflict between alert messages and manual feed and may happen with other LaserWriter printers.

HyperCard 2.0: How to Change Address Book's Font Size

=====

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Is there any way to increase the font size of the mailing labels that HyperCard prints from the Address Book? The default point size for the labels is very small.

DISCUSSION -----

To do this, you need HyperCard 2.0, which lets a text field contain multiple fonts, styles, and sizes.

- 1) Select the text you want to change.
- 2) Either choose "Text Style..." from the Edit menu, or make a choice from the Font or Style menu.

You can also use HyperTalk to find or set the attributes of any range of characters.

Apple IIe Card: Which Drives are Supported

=====

Article Created: 13 August 1991  
Article Last Reviewed: 3 June 1992  
Article Last Updated: 3 June 1992

TOPIC -----

- 1) What disk drives does the Apple IIe Card support?
- 2) Why hook up a UniDisk 3.5-inch to the Apple IIe Card?
- 3) How do I eject the internal 3.5-inch disk?
- 4) If I connect a compatible Apple 5.25 Drive to this Macintosh LC, can I run regular Apple IIe software?

DISCUSSION -----

- 1) The Apple IIe Card supports the following drives:
  - The two Internal Macintosh LC SuperDrive disk drives
  - One UniDisk 3.5-inch (part number A2M2053, white).
  - Two Apple 5.25-inch Disk Drive (part number A9M0107, platinum) connected to the drive cable or UniDisk 3.5. Note: If you hook up a UniDisk 3.5-inch and Apple 5.25-inch, the UniDisk 3.5-inch goes first.

The Apple IIe Card does NOT support:

- The Apple 3.5-inch
- UniDisk (beige 5.25-inch)
- DuoDisk
- Disk II

The older 5.25-inch drives use -12 volts, which the Macintosh LC does not support.

- 2) Some copy-protected applications require a UniDisk 3.5-inch as part of the configuration, or they won't work correctly. Nor do they work on the SuperDrive inside the Macintosh LC.
- 3) To eject a disk from an internal 3.5-inch disk:
  - Press Command-Shift-1
  - Enter the Option Panel (Command-Control-Esc) and press the Disk Eject button.
- 4) Yes. In Apple IIe mode, the Macintosh LC will function exactly as an Apple IIe.

TOPIC -----

My Macintosh IIIfx with a Macintosh Display Card 8•24 GC is having intermittent screen flicker. I've swapped out the Macintosh Display Card 8•24 GC, the DRAM in the Display Card, the monitor, and the logic board.

DISCUSSION -----

The flicker may be caused by the Macintosh Display Card 8•24 GC CDEV. Turn off the CDEV and restart the computer. If the flickering goes away, then the problem is related to software corruption or hardware/software incompatibility. This incompatibility can range to other hardware cards installed, especially other video cards made by third-party vendors, to incompatible software packages or other third-party INITs.

With the Macintosh Display Card 8•24 GC CDEV turned off, the card acts just like a Macintosh Display Card 8•24. If the flickering still occurs, you may be encountering an environment issue related to EMF (electromagnetic interference).

Article Created: 13 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I'm getting a random monkey alert sound on my Macintosh even though the alarm is off and the regular beep sound is selected in the Control Panel. I have no special sound INITs or CDEVs.

DISCUSSION -----

The sounds selected for the beep are loaded into RAM during startup. It's possible that your System Folder may be corrupted and is pointing to another beep sound.

Try starting up from a locked System disk and let it sit for a while to see if it does random beeps. If this doesn't fix things, trash and reinstall the System Folder. If the problem still persists when you start from the floppy, then you may have a hardware failure.

You also mentioned no special CDEVs and INITs being used. Were you referring to sound-type INITs? Other INITs that have some time/delay activation might also cause similar symptoms: SuperClock, screen savers, and spelling checker CDEVs to name a few.

Security: Everyone

Macintosh: When System Restarts Instead of Shutting Down (2/95)

=====

Article Created: 13 August 1991  
Article Reviewed/Updated: 24 February 1995

TOPIC -----

My Macintosh restarts when I select Shutdown from the Special menu. Why is this and how can I be assured my computer will actually shut down?

DISCUSSION -----

The first step is to determine if the problem is software related. Restart your computer with the Disk Tools diskette and select Shutdown to see if it works properly. If it does, the likely cause of the problem is corrupted system software. A clean installation of system software is recommended to resolve the problem.

If choosing Shutdown still causes a Restart, try zapping PRAM. For more information on zapping the PRAM, for the Tech Info Library article "Macintosh: How to Reset Parameter RAM".

For Macintosh computers with lockable power switches, such as the Macintosh IIci and Macintosh IIsi, make sure the switch is not locked in the ON position. Rotating the switch 90 degrees to the left should release it so it is not in the locked on position.

If you determine the problem is not related to the power switch or system software, there are three possibilities: a defective keyboard, power supply, or logic board (in that order). As a quick test, disconnect the keyboard and mouse from the Macintosh and try a manual shutdown. If the Macintosh stays off, start replacing ADB devices. If not, have the power supply checked.

If the Macintosh still does not work properly, have the logic board replaced.

X11: How to Start Up in Color (3/95)

=====  
Article Created: 20 August 1991  
Article Reviewed/Updated: 30 March 1995

TOPIC -----

Can X11 be started up in color?

DISCUSSION -----

Yes. This article describes a recommended method, as well as two others.

The recommended method  
-----

### Step 1

Create a file called ".X11" in the home directory of the user. Ensure that the ".X11" file is executable. The contents of the ".X11" file:

```
X -screen 0 -depth 8
```

### Step 2

Log on, selecting an X Window session at the login dialog.

Here are two other methods  
-----

- Modify the /usr/bin/X11/X file and insert before the \$\* in the startup entry:

```
-screen 0 -depth 8
```

- Start X11 at the command line in color with the command:

```
/usr/bin/X11/X -screen 0 -depth 8
```

DAL: Version 1.3 and Later Supports VM/XA

=====

Article Created: 23 August 1991  
Article Last Reviewed: 6 July 1992  
Article Last Updated: 6 July 1992

TOPIC -----

Does DAL support VM/XA?

DISCUSSION -----

DAL 1.3 (and later) supports VM/XA. DAL 1.2 (and earlier) does not support VM/XA. However, since under XA and ESA for VM IBM does not support the "attach to database" SQL/DS command, you must issue the "Open Database" DAL command with either a null database name or "@ SQL". Using one of these special database names will cause DAL to not attempt to do the "attach" command, but instead to connect to the default database.

I need the following information on a Sony SRD2040 drive:

- Number of heads
- Number of cylinders
- Number of tracks
- Number of sectors per track

DISCUSSION -----

Here are the specifications for the SRD2020 and SRD2040 drives:

- Number of heads:
  - SRD2020A (20MB): 2 heads
  - SRD2040A (40MB): 4 heads
- Number of cylinders:
  - 624 cylinders
- Number of tracks:
  - 624 per head
- Number of sectors per track:
  - 33 sectors per track

ImageWriter LQ: Ribbon Specifications (8/94)

=====

Article Created: 19 September 1991  
Article Reviewed/Updated: 31 August 1994

TOPIC -----

What are the ImageWriter LQ ribbon specifications?

NOTE: This product has been discontinued and is no longer available.

DISCUSSION -----

Here are the ImageWriter LQ ribbon specifications:

### Ribbon

-----

- Cassette containing black-inked fabric ribbon, continuous
- Optional: four-color ribbon (black, yellow, magenta, cyan)

### Ribbon Life

-----

- 4 million characters (black)
- 1 million characters/band (color)

### Shelf Life

-----

- Packaged, unwrapped, not exposed to the environment, and stored under cool conditions (80 degrees F): Approximately 2 years
- Unwrapped and exposed to the environment: Approximately 6 months to 1 year

Note: The older the ribbon, the drier it becomes when exposed to sunlight, air, and so on.

Aristotle: Display and Management Programs Quit Differently

=====

Article Created: 12 September 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

We have Macintosh LC computers with Apple IIe cards installed and Apple IIe software version 2.0 in our lab. When teachers log on to the Macintosh LC and start the Apple IIe over the network, they connect to the server through the Aristotle menu system. Everything works fine, except they can't quit the teacher management menu. We get a screen with /ram2/ at the top and three options at the bottom. Why doesn't it go back to the Aristotle log-on screen?

DISCUSSION -----

The screen displaying the /ram2/ indicates the Aristotle menu management application successfully quit. The /ram2/ screen is a menu system from ProDOS 8 version 1.9. The three options at the bottom of the screen provide the method of navigation through the menu system.

The current ProDOS volume name is /ram2/. To change to a different volume (that is, probably the AppleShare file server volume), press the Tab key. This displays all applications and folders (subdirectories) on the volume. (The "/ram2/" volume shows no applications or folders.) The up and down arrow keys allow you to move to an application or folder. The Return key launches an application, or opens a folder. The ESCape key closes the current folder and moves into the next higher folder.

Previous versions of ProDOS 8 left the user with the "ENTER PREFIX (PRESS "RETURN" TO ACCEPT)" message with the current prefix as the default. After entering the prefix, you need to enter the name of the application. The menu system of ProDOS 8 version 1.9 provides a more useful interface.

The two Aristotle applications, Display and Management, behave differently

when the user exits: the Display program returns the user to the launching application, but Management returns the user to the ProDOS quit location. This is true both for an Apple IIe computer and for a Macintosh LC with Apple IIe Card.

Here are two ways to run Aristotle:

- First, you can run the Management program immediately. To accomplish this, go to the server's Administration program. Select the teacher and set the startup application to Aristotle's Management program. This option returns the teacher to the ProDOS 8 v1.9 menu (the /ram2/ screen).

LOGOFF from the Apple IIe Workstation Card disk provides a graceful sign off from the server. When you use LOGOFF, the log-on list of servers is not in alphabetical order. Open Apple-Control-Reset (Command-Control-Reset) works as well. This is not so graceful, but causes no damage.

- The second variation uses the Management program to set up a "class" of teachers who can run the Management program from the Display program. For example, when teachers log on to the server, their startup program is Aristotle's Display. From within Display's menu, teachers can select Management. This option returns to the Aristotle Display program. You need to quit the Display program to log off the file server.

## Apple IIe Card Software v2.0: Not Tested with System 6.0.7

Revised: 6/10/92  
Security: Everyone

Apple IIe Card Software v2.0: Not Tested with System 6.0.7

=====

Article Created: 16 September 1991  
Article Last Reviewed: 3 June 1992  
Article Last Updated:

TOPIC -----

Is it essential to install system software version 6.0.8 (that is, 7.0 print drivers) with the Apple IIe Card software version 2.0?

DISCUSSION -----

The Apple IIe software v2.0 was only tested using system software version 6.0.8. There is no known reason for the Apple IIe Card v2.0 software to fail using version 6.0.7. However, Apple cannot stand behind the use of version 6.0.7 due to the lack of testing.

Whatever configuration you decide on, the print driver versions must be the same on all systems. Otherwise, there will be driver conflicts when the printers are used.

## AppleShare Print Server: Transition from System 6 to System 7

Revised: 9/21/92  
Security: Everyone

AppleShare Print Server: Transition from System 6 to System 7

=====

Article Created: 12 September 1991

### Article Change History

-----

09/15/92 - REWRITTEN

- To explain better the existing situation with System 6.0.8, the desired situation, and to note that AppleShare 3.0 is available.

### TOPIC -----

I would like to use the Macintosh IIci as an AppleShare Print Server. I'm running system software version 6.0.8 (equivalent to System 6.0.7 with the addition of System 7 print drivers). I run the Network Products Installer version 6.0.7 to install the AppleShare Print Server, and it doesn't recognize the 7.0 LaserWriter drivers. I must quit the Installer, remove the 7.0 print drivers, install the print server software, and reinstall 7.0 drivers. Is there an easier way to do this?

### DISCUSSION -----

Unfortunately, it doesn't get much easier. The following steps will minimize the confusion:

- 1) Format the hard drive (if it's not already formatted).
- 2) Install system software 6.0.8 (if not already installed).
- 3) Remove the print drivers from the System Folder (in System 6.0.8, they are actually the System 7 print drivers).
- 4) Install the AppleShare Print Server using Network Products Installer 6.0.7.

5) Drag over the LaserPrep version 7.0 file from the 6.0.8 disks.

There is no need to reinstall the print drivers on the Print Server. They aren't used. However, it is VERY important to put the LaserPrep file in the folder with the Print Server's System file.

Note that upgrading to AppleShare 3.0 will eliminate much of this confusion and the steps required to get the print server running successfully with System 7 drivers.

## System 7: Making KiwiEnvelopes 3 Work with LaserWriter IISC

Revised: 8/26/92  
Security: Everyone

System 7: Making KiwiEnvelopes 3 Work with LaserWriter IISC

=====

Article Created: 10 September 1991

### Article Change History

-----

08/25/92 - REVIEWED

- For accuracy.

### TOPIC -----

I purchased KiwiEnvelopes 3.1.3 to be compatible with System 7. The version 3.1.3 did not print properly to the LaserWriter IISC with the Personal LaserWriter SC driver (Apple provides this driver for LaserWriter IISC System 7 compatibility).

The Personal LaserWriter SC feeds envelopes from the side of the tray, and the LaserWriter IISC feeds them from the center. Print on envelopes was in the wrong location (shifted downward on the envelope).

How can I get proper printing on the LaserWriter IISC?

### DISCUSSION -----

There are two ways to modify KiwiEnvelopes 3.1.3 to remedy this:

- Throw Away "KiwiFile3".

This causes the software to re-evaluate the printer in use and reset preferences. The software is now compatible with the LaserWriter IISC. However, you lose all names and addresses stored by KiwiEnvelopes.

- Use ResEdit to Remove the "PRTPr" Resource from "KiwiFile3".  
Trashing this resource resets preferences, but retains names and addresses stored in the file.

## LaserWriter IINTX: DIP Switch Positions Affect Renaming

Revised: 10/1/91  
Security: Everyone

LaserWriter IINTX: DIP Switch Positions Affect Renaming

=====

Article Created: 19 September 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

After moving a LaserWriter IINTX, we could find the printer in the Chooser as "LaserWriter IINTX," but the name should be "LaserWriter IINTX 5/80." On the start page, the name was "LaserWriter IINTX 5/80," but the Chooser again called it "LaserWriter IINTX." We renamed the printer, and the name appeared on the start page, but not in the Chooser. The LaserWriter IINTX printed normally through all this.

We found that the DIP switches 5 and 6 were down. We switched them up, and this fixed the naming problem. Can you explain this behavior?

DISCUSSION -----

Moving switches 5 and 6 to the down position sets asynchronous handshaking to XON/XOFF. The LaserWriter broadcasts the default printer name set in ROM instead of using the changeable version set in the ZPRAM (Zero Power RAM). The startup page still registers the correct name, but the name broadcast over the network doesn't change.

Make sure that both switches are in the up position unless you require another form of handshaking. Other combinations of these switches do not cause the name inconsistencies.

## System 7: Tips for Using Memory Efficiently

Revised: 6/29/92  
Security: Everyone

System 7: Tips for Using Memory Efficiently

=====

Article Created: 9 September 1991  
Article Last Reviewed: 29 June 1992  
Article Last Updated:

TOPIC -----

When it's difficult to open applications or print, these tips will help use Macintosh memory more efficiently. For more information about managing memory, see the Macintosh User's Guide.

To use System 7, your Macintosh needs at least 2MB of memory. If you customarily work with several programs at a time, you may wish to install more memory.

DISCUSSION -----

Use the Available Memory

-----

If you get a message asking if you'd like to open a program using the "available memory," click OK, and the program will open. This message appears when the available memory is greater than the minimum memory required to open the program, but less than the recommended amount. In rare cases, you may be unable to use some features of the program.

Quit Some Open Programs

-----

When you open an application and see the "not enough memory" message, you should quit one or more open programs. Open the Application menu (right end of the menu bar) to see which programs are open.

This message appears when the available memory is less than the minimum required to open the program.

### Reduce a Program's Memory Size

-----

You can often avoid memory problems by reducing a program's current memory size. In rare cases, reducing a program's memory size degrades performance. Follow these steps to reduce a program's memory size:

- 1) Quit the program.
- 2) In the finder, select the program's icon.
- 3) Choose Get Info from the File menu. The program's Info window appears.
- 4) Reset the memory size.
- 5) Close the Info window.
- 6) Try again to open the program.

### Quit Some Programs Before Printing

-----

When you print, you'll sometimes see the Application menu begin to blink. When this happens, follow these steps to quit a program and make more memory available for printing:

- 1) Choose Finder from the Application menu. You'll see an alert box.
- 2) Click OK to close the alert box.
- 3) From the Application menu, choose the program you want to close. The program becomes active.
- 4) Choose Quit from the File menu.

After quitting one or more programs, try printing again.

### Set the Disk Cache to the Smallest Size

-----

The disk cache is a portion of the computer's memory set aside to limit how often the computer must read from a disk. This speeds up the computer's performance. By reducing the size of the disk cache, you can make more memory available for application programs. Follow these steps to adjust the disk cache:

- 1) Choose Control Panels from the Apple menu.
- 2) Open the Memory control panel (double-click the Memory icon).
- 3) In the Memory control panel, click the down arrow repeatedly until the disk cache is the smallest possible size.
- 4) Choose Restart from the Special menu to restart the Macintosh.

#### Drag Optional System Extensions Out of the System Folder

-----

System extensions (also known as INITs) compete with application programs for memory. (System extension icons are often displayed in the bottom-left portion of the screen when the computer starts up.) You can conserve memory by removing system extensions that you don't need. For instance, if your Macintosh is not connected to a host database, you can remove the DAL (Data Access Language) system extension. Likewise, if your Macintosh is not connected to a network, you can remove the AppleShare system extension. Follow these steps to remove system extensions:

- 1) Open the System Folder.
- 2) Open the Extensions folder.
- 3) Drag the system extension icon out of the System Folder to another location on your hard disk.
- 4) Restart the computer.

#### Restart the Computer

-----

If you have opened and closed a number of programs, your Macintosh memory can become fragmented so that you can't open a large program. When this happens, quit all the open programs, and restart the computer.

#### Turn Off Background Printing

-----

When background printing is on, you can print while using the computer for other work. If you don't need background printing, you can reduce the amount of memory required to print by turning it off. Follow these steps to turn off background printing:

- 1) Choose the Chooser from the Apple menu.
- 2) In the Chooser window, select a LaserWriter icon.
- 3) Click the Background Printing: Off button.

#### Turn Off File Sharing

-----

When file sharing is turned on, you can share information on your computer's hard disk with other users on a network. If you don't currently use file sharing, you can conserve memory by turning it off. Follow these steps to turn off file sharing:

- 1) Choose Control Panels from the Apple menu.

- 2) Open the Sharing Setup control panel (Double-click the Sharing Setup icon).
- 3) Click Stop in the File Sharing section of the Sharing Setup control panel. A message appears asking how many minutes the computer should wait until file sharing is turned off.
- 4) Type a number, and click OK.

## LaserWriter IIf and IIg: How They Differ from LaserWriter IINTX

Revised: 9/30/91  
Security: Everyone

LaserWriter IIf and IIg: How They Differ from LaserWriter IINTX

=====

Article Created: 1 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

This article describes the enhancements of the LaserWriter IIf and IIg, compared to the LaserWriter IINTX.

DISCUSSION -----

The LaserWriter IIf offers a 50% performance improvement over the LaserWriter IINTX. With gray scale mode disabled, the LaserWriter IIg gives twice the performance of the IINTX. The IIg's performance is the same as the IINTX with gray scale mode active.

The LaserWriter IIf and IIg controllers provide twice the processing power of the LaserWriter IINTX. The major controller components include:

- Processors
- Memory
- ASICs (Application Specific Integrated Circuits)
- I/O

These components, plus the PostScript Level 2 software, provide significantly faster performance than LaserWriter IINTX.

The Motorola 68030 in the IIf and IIg improves performance over the 68020 in the LaserWriter IINTX in the following ways:

- The 68030 runs at a faster clock speed. This makes the IIf 25% faster and the IIg 55% faster than the IINTX.

| LaserWriter | Clock Speed |
|-------------|-------------|
| -----       | -----       |
| IINTX       | 16 MHz      |

|     |        |
|-----|--------|
| IIf | 20 MHz |
| IIg | 25 MHz |

- The 68030 has integrated instruction and data cache to give a 15% performance improvement over the IINTX.
- The 68030 has burst-mode RAM access to transfer large amounts of data in less time.

PhotoGrade allows printing more than 65 levels of gray. The LaserWriter IINTX offers 33 levels of gray.

The IIf and IIg use 80ns memory. This means that RAM from the IINTX or IISC can't be used in the LaserWriter IIf or IIg. The Macintosh IIfx uses the same RAM as the LaserWriter IIf and IIg.

Unlike the LaserWriter IINTX, the LaserWriter IIg has three communication ports, and all three can be physically connected at the same time. Arbitration logic controls the activity of the ports. Because PostScript processes one job at a time, only one port has access to the printer at any given time.

LaserWriter IIf: Description (Discontinued)

=====

Article Created: 1 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

This article describes the LaserWriter IIf.

DISCUSSION -----

The 300 dpi (dots per inch) Apple LaserWriter IIf makes use of Apple's FinePrint technology to smooth jagged edges frequently found in laser-printed documents.

RAM

---

You can upgrade the LaserWriter IIf to 5MB RAM. The upgrade adds Apple's PhotoGrade capabilities and high-quality scanned images and graphics. PhotoGrade allows printing more than 65 levels of gray.

Networking

-----

The LaserWriter IIf comes with built-in LocalTalk networking capabilities for use with an AppleTalk network system. The design of this printer allows simultaneous connection with multiple kinds of networks and computers. There's no need to manually reconfigure the printer to receive data through a particular port.

Performance

-----

The LaserWriter IIf prints documents up to two times faster than the LaserWriter IINTX due to a high-speed controller and Adobe's PostScript Level 2 software. This generation of PostScript language improves printing speed, adds new capabilities, and is compatible with existing applications and drivers. The IIf is also compatible with the Hewlett Packard LaserJet

IIP (PCL 4+) emulation software.

LaserWriter IIf: Specifications (Discontinued)

=====

Article Created: 1 October 1991  
Article Reviewed/Updated: 06 April 1995

TOPIC -----

This article gives the technical specifications for the LaserWriter IIf.

DISCUSSION -----

Marking Engine

- 
- Canon LBP-SX laser

Controller

- 
- 20MHz 68030 CPU, ASICs, and I/O processors
  - Optional upgrade for LaserWriter IISC, IINT, and IINTX

Memory

- 
- 2MB RAM, up to 32MB (increased to 4 MB in 1992)
  - 2MB ROM

Print Quality

- 
- 300 dpi enhanced with FinePrint
  - Optional PhotoGrade for high-quality scanned images by upgrading to 5MB RAM

Fonts

- 
- ITC Avant Garde Gothic, ITC Bookman, Courier, Helvetica, Helvetica Narrow, New Century Schoolbook, Palatino, Symbol, Times, ITC Zapf Chancery, and ITC Zapf Dingbats
  - Supports any TrueType or PostScript fonts

### Speed

-----

- Eight pages per minute maximum

### Interfaces

-----

- RS-422/423 (8-pin circular miniDIN)
- RS-232C (25-pin D shell connector)
- Simultaneous connection to LocalTalk, RS-232, RS-422
- SCSI to attach an external hard disk for font storage

### Recommended Duty Cycle

-----

- Toner cartridge - 4,000 pages at 5% density
- Printer - minimum 300,000 pages (equivalent to printing 200 pages a day, 5 days a week, 52 weeks a year, for more than 5 years)

### Print Materials

-----

- Media
  - Apple recommends 16- to 20-lb. photocopy or typewriter bond [60 to 80 g/m (to the 2nd power)] in normal mode; up to 36-lb. [135 g/m (to the 2nd power)] in manual mode with face-up tray open.
  - Most textured and colored stock
  - Labels, envelopes, and transparencies
- Sizes
  - Paper: U.S. letter, U.S. legal, A4, B5
  - Envelopes: minimum 3.5 x 7 inches (86 x 178mm);  
maximum 7.4 x 10.5 inches (188 x 267mm)

### Capacities

-----

- Paper cassette
  - 200 sheets of 20-lb. [75 g/m (to the 2nd power)] paper
  - Optional envelope cassette: 15 envelopes
  - Manual feed with single sheet feeder

### Printable Surface

-----

- Maximum printable line: 8.1 in. (205.9 mm)
- Minimum top and bottom margins: .197 in. (5.1 mm)
- Minimum left margin: .197 in. (5.1 mm)
- Minimum right margin: .197 in (5.1 mm)

The actual printable area may vary depending on the application and amount of RAM installed.)

### Size and Weight

-----

- Height: 8.6 inches (21.8 cm)
- Depth: 18.5 inches (47.5 cm)
- Weight: 45.0 lb. (20.3 kg)
- Width: 20.0 inches (50.8 cm)

# ..TIL08912-LaserWriter\_IIf-Specifications\_Discontinued.pdf

- Width with letter-size cassette: 26.4 in. (67 cm)

## Power Requirements

-----

- U.S./Japan: 90 to 126 volts AC, 50 to 60 hertz
- Europe/Australia: 198 to 264 volts AC, 50 hertz

## Power Consumption

-----

- Standby: 170 watts average
- Operating: 900 watts maximum at 115 volts  
780 watts maximum at 220 volts  
880 watts maximum at 240 volts

## Operating Environment

-----

- Temperature: 50 to 90 degrees F (10 to 32 degrees C)
- Humidity: 20% to 80%

## Page Description Language

-----

- Adobe PostScript Level 2

## Emulation

-----

- HP PCL4+ (emulates HP LaserJet IIP)

## Article Change History:

06 Apr 1995 - Noted that standard memory level was increased.

## LaserWriter IIg: Description (Discontinued)

Revised: 6/2/94  
Security: Everyone

LaserWriter IIg: Description (Discontinued)

=====

Article Created: 1 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

This article describes the LaserWriter IIg.

DISCUSSION -----

The LaserWriter IIg is an expandable network printer that makes use of PhotoGrade technology. The unit can print images with more than 65 levels of gray and smooths jagged edges using FinePrint technology.

### Networking

-----

LocalTalk allows for plug-and-play connection to an AppleTalk network. The LaserWriter IIg has built-in Ethernet features for high-speed EtherTalk networks. You can simultaneously connect the unit to Ethernet, LocalTalk, and other serial interfaces. You can also connect it to multiple types of computers or networks.

The LaserWriter IIg automatically chooses the AppleTalk default zone at the nearest router. You must change the PostScript instructions to set the AppleTalk zone differently.

### Performance

-----

A high-speed controller and Adobe's PostScript Level 2 software increase document printing speed up to twice that of the LaserWriter IINTX. The newest PostScript improves printing speed, adds new capabilities, and is compatible with existing applications and drivers. The IIg is also compatible with the Hewlett Packard LaserJet IIP (PCL 4+) emulation software.

## LaserWriter IIf and IIg: Support Issues

Revised: 6/16/93  
Security: Everyone

LaserWriter IIf and IIg: Support Issues

=====

Article Created: 1 October 1991

ArticleChange History

-----  
06/15/93 - REVISED  
• For technical accuracy

TOPIC -----

This article discusses some of the support issues for the LaserWriter IIf and IIg.

DISCUSSION -----

Driver and Level 2 Support

-----  
The driver shipped with LaserWriter IIf and IIg is the LaserWriter driver version 7.0, which doesn't support PostScript Level 2 operators. Access to new Level 2 features is limited to downloaded PostScript programs. The next LaserWriter driver will add Level 2 functionality. The IIf and IIg operate more efficiently even without the new driver because of improved memory management and high speed cache.

Missing Type 1 Fonts In ROM

-----  
Due to extremely limited ROM space, the ITC Zapf Dingbats Type 1 font was removed from LaserWriter IIf and IIg ROMs, and included, as a downloadable font, on the font disk.

Legal Size Printing

-----  
The standard LaserWriter IIf and IIg configurations don't support full legal size printing. At the standard RAM configurations, the LaserWriter IIf can't print full legal pages and the LaserWriter IIg can't print gray-scale legal pages. If you want to use legal size paper with full printing

capability, upgrade the RAM from 2MB to 4MB on a LaserWriter IIf, and from 5MB to 8MB on a LaserWriter IIg.

#### Don't Use Refilled Toner Cartridges

-----  
Refilled cartridges performed poorly during LaserWriter IIg gray-scale testing, and aren't recommended.

#### Kanji Support

-----  
The LaserWriter IIg has composite font support, but due to the HFS disk structure, there is no copy protection for the Kanji fonts. Kanji will be fully supported in the LaserWriter 1.1 ROMs.

#### No Diablo 630 Emulation

-----  
LaserWriter IIg ROMs don't provide Diablo 630 emulation.

## Apple OneScanner: How it Differs from the Apple Scanner

Revised: 9/30/91  
Security: Everyone

Apple OneScanner: How it Differs from the Apple Scanner

=====

Article Created: 1 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

This article describes the Apple OneScanner's enhancements, compared to the original Apple Scanner.

DISCUSSION -----

### Overview

-----

The Apple OneScanner looks like the Apple Scanner flatbed scanner, but supports 8-bit gray scale and provides higher performance. The new scanning application -- called Ofoto -- produces high-quality scans. HyperScan 2.0 scans the images directly into HyperCard to resize the cards and give better image control.

### Features

-----

These features differ from the Apple Scanner:

- 8-bit image depth (256 gray scale resolution)
- Variable resolution from 72-dpi to 300-dpi in 1-dpi increments
- Higher scanning and data transfer speed
- Finer control of brightness and contrast settings
- No ADB port

### Software Compatibility

-----

All of the Apple OneScanner software is backward-compatible with the original Apple Scanner. A software upgrade kit will give the Apple Scanner all the features of the new software. The Apple Scanner is limited to 4-bit gray scale, but the software upgrade produces better images and is much easier to use.

## Apple OneScanner: Description

Revised: 2/28/95  
Security: Everyone

Apple OneScanner: Description

=====

Article Created: 1 October 1991  
Article Reviewed/Updated: 28 February 1995

TOPIC -----

This article describes the Apple OneScanner.

DISCUSSION -----

The Apple OneScanner is a flatbed scanner that makes use of Ofoto scanning software from Light Source, Inc. Ofoto allows automatic scanning, or manual control of each aspect of the scanning process. The OneScanner provides for gray-scale scanning with 256 levels for photographic-quality black-and-white images. High-quality rotation and scaling algorithms enhance image quality. You can use System 7 Balloon Help to find out about OneScanner features.

This unit comes with scaling tools for choosing the exact size of images you plan to scan. You can rotate and manipulate images with no loss of quality. With the OneScanner, you can obtain images through any printer -- from the Apple StyleWriter to professional imagesetters.

The OneScanner comes with HyperScan 2.0 software, allowing for incorporation of high-quality scanned images into HyperCard 2.0 stacks. This unit is compatible with all Macintosh computers and with most Macintosh applications, including word processing, presentation, graphics, database, and page-layout programs. The OneScanner is compatible with PICT, TIFF, EPS, and MacPaint file formats.

Apple OneScanner: Technical Specifications (Discontinued)

=====  
Article Created: 1 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

This article gives the technical specifications for the Apple OneScanner.

DISCUSSION -----

### Technical

- 
- Scanner Type: Flatbed
  - Resolution: 72 - 300 dpi in 1 dpi increments
  - Maximum document size: 8.5 by 14 inches
  - Gray-scale levels: 256 levels (8 bits per pixel)
  - Scaling: unlimited
  - Interface: SCSI (Small Computer Systems Interface)

### Electrical Requirements

- 
- Line voltage: 110 volts AC  $\pm$  10%
  - Frequency: 58 to 62 hertz
  - Power: 45 watts maximum

### Environmental Requirements

- 
- Operating temperature: 50 to 104 degrees F  
(10 to 40 degrees C)
  - Storage temperature: 50 to 149 degrees F  
(10 to 47 degrees C)
  - Relative humidity: 5% to 95% noncondensing
  - Altitude: 0 to 10,000 ft.(0 to 3048 m)
  - Noise (maximum): Standby <30 dba, Scanning <55 dba

#### Ofoto Application Software

-----

- Autoscan for setting all parameters, selecting and straightening images
- Adaptive calibration of any printer to deliver the best possible images
- Selection and scaling tools for enlarging or reducing an image
- Virtual imaging system to accommodate large image files by expanding system memory with hard disk space
- High-quality rotation and scaling for image manipulation without loss of quality
- Balloon Help facility for interactive learning
- Support for PICT, TIFF, EPS, and MacPaint file formats

#### HyperScan 2.0

-----

- Variable size scanning to match the size of HyperCard 2.0 stacks
- Controls on palettes for each access
- Built-in help

#### Size and Weight

-----

- Height: 4.4 inches (11.2 cm)
- Width: 13.6 inches (34.5 cm)
- Depth: 21.8 inches (55.4 cm)
- Weight: 23.0 lb. (10.45 kg)

#### System Requirements

-----

- Macintosh system software version 6.0.7 or later
- HyperCard 2.0 to use HyperScan 2.0
- Appropriate SCSI cabling

#### Compatibility

-----

- All Macintosh computers
- Most Macintosh applications, including word processing, presentation, graphics, database, and page layout programs
- PICT, TIFF, EPS, and MacPaint file formats

## Apple OneScanner: Support Issues (9/94)

Revised: 9/26/94  
Security: Everyone

Apple OneScanner: Support Issues (9/94)

=====

Article Created: 1 October 1991  
Article Reviewed/Updated: 26 September 1994

TOPIC -----

This article gives information about some of the support issues for the Apple OneScanner.

DISCUSSION -----

Software  
-----

The Ofoto software requires LaserWriter drivers 6.0.1 or later. Gray scale images won't print properly with earlier drivers.

Ofoto also requires system software version 6.0.7 or later and 32-bit QuickDraw. It is fully compatible with System 7.

Lamp  
-----

You need to change the lamp after approximately 30,000 scans. The scanning software indicates when it's necessary to change the scanner lamp.

Macintosh Quadra and Power Macintosh  
-----

These computers use a faster SCSI chip, with reset interrupt timing 10 times shorter than previous Macintosh computers. Because of this timing difference, they develop SCSI gridlock and the scanning software indicates that the scanner isn't connected. This occurs only when the scanner is turned on before the Macintosh is turned on.

The solution is to reset the timing by turning the scanner off, then on again. When Ofoto doesn't recognize the scanner, it displays a note in the dialog box telling the user to cycle the scanner power and try again.

The next Apple OneScanner ROM revision (version 2.03) will fix this.

Note: If you are unsure which ROM revision your Apple OneScanner or any other SCSI device has, one easy and quick method to determine this is to connect the SCSI device to a Macintosh computer and launch a product called "SCSI Probe" 3.4 or later. SCSI Probe provides the SCSI ID, device type, vendor info, product name, and version information. In the case of the OneScanner the version information field provides the ROM version number that can be used to identify whether a OneScanner could potentially exhibit the problem described in this article.

For more information search for the article titled, "OneScanner: Quadra Doesn't Recognize It At Startup".

These articles can help you locate the software mentioned here:

- "Where To Find Apple Software Updates"  
Lists online services for "free" Apple software updates.
- "Obtaining Apple Product Support in the USA"  
Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech. Info. Library.

#### Article Change History:

- 16 Sep 1994 - Review article, updated to include Power Macintosh and include information on finding software online.
- 18 Dec 1992 - Updated to include information on SCSI Probe and how to determine ROM revisions of SCSI devices.

## Macintosh 21 Color Display: Description (Discontinued 3/94)

Revised: 3/14/94  
Security: Everyone

Macintosh 21" Color Display: Description (Discontinued 3/94)

Article Created: 21 October 1991  
Article Reviewed/Updated: 14 March 1994

TOPIC -----

This article describes the Apple Macintosh 21-inch Color Display, which Apple discontinued on 14 March 1994, replacing it with the Apple Multiple Scan 20 Display.

DISCUSSION -----

The Apple Macintosh 21-inch Color Display lets you work with two full pages of text and graphics in color. The unit design allows large-screen color display for presentations, page layouts, engineering design, and video applications. The 21-inch screen provides more than three times the screen area of standard displays, and features high levels of brightness and contrast. The anti-glare screen minimizes reflective glare, and the tilt and swivel base allows for working-angle adjustments.

The built-in video on the Quadra 700 and 900 supports the display in 16 and 256 colors, respectively. It's equipped with an auto-degaussing circuit to insure consistent color purity and distortion-free images.

The display contains three Apple Desktop Bus (ADB) connectors on the display front to allow direct connection of a keyboard, mouse, or other ADB device.

This unit is compatible with newer operating systems, such as Macintosh system software version 7.0 and A/UX. The display is also well-suited for preparation of video and animation presentations to use with television monitors or videocassette recorders.

The Macintosh 21-inch Color Display supports as many colors as the video circuitry allows. For example, you can access 256 colors simultaneously from a palette of more than 16 million colors, using a Macintosh Display Card 8•24 or 8•24GC.

## Macintosh 21 Color Display: Specifications (Discontinued 3/94)

Revised: 3/14/94  
Security: Everyone

Macintosh 21" Color Display: Specifications (Discontinued 3/94)

=====

Article Created: 1 October 1991  
Article Reviewed/Updated: 14 March 1994

TOPIC -----

This article gives the technical specifications for the Macintosh 21-inch Color Display, which Apple discontinued on 14 March 1994, replacing it with the Apple Multiple Scan 20 Display.

DISCUSSION -----

### System Requirements

-----

- Macintosh personal computer equipped with an appropriate video card
- Video cable (supplied with the display)

### Optical Features

-----

- 20-inch diagonal viewable with in-line gun
- 90 degree deflection angle
- Black matrix-type dot screen
- Phosphor type P22 (aluminized)
- Flat, square faceplate with gray filter glass, 50% nominal light transmission
- Shadow mask

### Screen Resolution

-----

- 1152 horizontal pixels by 870 vertical lines; 79 dots per inch (dpi)
- .26 mm horizontal by .29 mm vertical dot pitch

### Input Signals

-----

- Red, green, and blue video signals; TTL separate sync

### User Controls

-----

- Back panel
  - Power switch (above power cord)
  - Manual degauss (above security lock)
- Front panel
  - Brightness, with detent (right)
  - Contrast (left of brightness control)

#### Scanning and Refresh Rates

-----

- Horizontal scan rate: 68.7 kilohertz
- Vertical refresh rate: 75 hertz

#### Rise and Fall Time

-----

- Five nanoseconds, maximum

#### Active Video Display Area

-----

- 14.6 inches horizontal by 11.0 inches vertical (371 mm horizontal by 280 mm vertical); remainder of display area is used for border.

#### Electrical Requirements

-----

- Voltage: 85 to 135 volts AC or 170 to 270 volts AC
- Frequency: 47 to 63 hertz
- Power: 165 watts maximum

#### Fuse Protection

-----

- Internal power line fuse protection; the display fuse should be replaced with a fuse of the same type by a qualified service technician.

#### Environmental Requirements

-----

- Operating temperature: 50 to 95 degrees F (10 to 35 degrees C)
- Operating humidity: 95% maximum, noncondensing
- Maximum altitude: 10,000 feet (3,048 m)

#### Size and Weight

-----

- Height: 18.5 inches (47.0 cm)
- Width: 19.6 inches (49.8 cm)
- Depth: 20.9 inches (53.0 cm)
- Weight: 79.6 lb. (36.2 kg)

#### Safety Agency Approvals

-----

- Emissions: FCC (class A), VDE (class A), FTZ, CISPR, Swedish MPR magnetic (VLF and ELF)
- Safety: UL, CSA, FDA/DHHS, Scandinavian EMKOs, PTB

#### Article Change History:

## StyleWriter: Printing from Apple IIfx Card

Revised: 6/10/92  
Security: Everyone

StyleWriter: Printing from Apple IIfx Card

=====  
Article Created: 24 September 1991  
Article Last Reviewed: 3 June 1992  
Article Last Updated:

### TOPIC -----

Does the Apple IIfx Card software version 2.0 support printing to the StyleWriter?

### DISCUSSION -----

The Apple IIfx Card version 2.0 allows printing via print drivers installed in the Macintosh LC computer System Folder. If the StyleWriter driver (or other driver) is in the Macintosh LC System Folder, the Apple IIfx Card can print to the StyleWriter (or other printer).

Follow these steps:

- 1) In the Apple IIfx Option Panel, place the Printer Card icon in the appropriate slot using the Slots icon in the scrolling icon area. By convention, this is slot 1.
- 2) In the scroll icon area, choose the Print Card icon. This displays the currently selected printer.
- 3) A note in the dialog area indicates that you can select alternate printers via the Chooser desk accessory. Select a printer in the standard Macintosh Chooser.

## Graphic Conversions: PICT to/from CGM

Revised: 11/4/92  
Security: Everyone

Graphic Conversions: PICT to/from CGM

=====

Article Created: 12 October 1989

### Article Change History

-----

11/03/92 - CORRECTED

- The vendor search string information

### TOPIC -----

Can you recommend software for converting MS-DOS PC graphics output to Macintosh applications (PICT format) and back?

### DISCUSSION -----

Typically, MS-DOS PC graphics standards are of competing standards and legally nonconforming variations. Some PC packages can do bitmap conversions through screencaptures (Hijak, Graphics-Link Plus) and write MacPaint format files, but these translations lose color information and are bitmapped versus object-oriented.

There is one standard, however, that some PC programs can support: Computer Graphics Metafile (CGM). CGM files are produced by many GKS-type applications (from mainframes to micros) and many PC graphic packages (Harvard Graphics, SAS, Freelance Plus, and so on). Genigraphic workstations also support CGM, as do a whole host of other boxes.

There are three approaches to converting a PICT file into a CGM file: 1) Use a translation application, such as CADMover 3.2. 2) Use a Chooser-selectable driver, such as GraphPorter. 3) Use a graphics application that can read a PICT file and write a CGM file.

CADMover 3.2 (from Kandu Software), FlexiCAD 2.0 (from Amiable Technologies, Inc.) and Canvas 3.0 (from Deneba Software) all move files in both directions.

GraphPorter (from GSC Associates) is a SuperGlue-like Chooser device that creates a CGM file from a PICT or PICT2 file when a user prints. As a utility, GraphPorter makes it possible for Macintosh users to share graphic output with a PC via CGM.

MetaPict (also from GSC Associates) converts CGM to PICT or PICT2 only (not the reverse direction). If a Macintosh user wants to import CGM files from a Genigraphics slide-making machine or Harvard Professional Graphics and manipulate the object-oriented graphics in Canvas or MacDraw, the user can add MetaPict to their graphic conversion tools. There is a large, installed base of Genigraphics objects and Harvard Graphic users who would benefit from these utilities.

Another utility for CGM to PICT only conversions, is PICTure This! (from FGM, Inc.). PICTure This! converts a wide range of graphic file formats to PICT2. The PICT files can be used as is, or edited by most Macintosh software packages. In addition, the program allows users to save the converted PICT image into the Clipboard so that it can be pasted into another application.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

## AppleShare Server 3.0: Upgrade Information (Discontinued)

Revised: 5/22/95  
Security: Everyone

AppleShare Server 3.0: Upgrade Information (Discontinued)

=====

Article Created: 15 October 1991  
Article Reviewed/Updated: 22 May 1995

TOPIC -----

The following information serves to inform customers how to upgrade to AppleShare Server 3.0.

DISCUSSION -----

AppleShare Server 3.0 was introduced on October 15, 1991. As a method of upgrading the installed base as well as new customers to AppleShare Server 3.0, an upgrade program - via a coupon - has been established. New customers will be eligible to receive AppleShare Server 3.0 at no charge, the installed base will be offered a reduction in price to upgrade.

The disk file - AppleShare Coupon - is the upgrade coupon for new customers. The order form - AppleShare Order Form - is for the installed base. Although the AppleShare Server 3.0 product will not be available for fulfillment until December, the program begins on October 15, 1991; therefore, coupons may be submitted to the fulfillment house to begin processing on October 15. In addition, coupons (both the new customer coupon and the installed base order form) are available through PROMO.DIST. When requesting additional coupons through PROMO.DIST please note the number as follows:

- #900300 - coupon for new customers to receive the product at no charge.
- #900301 - order form for the installed base to purchase the product at a reduced price.

### Requirements

-----

Customers who purchase AppleShare File Server 2.0 between October 15, 1991 and December 31, 1991 will be eligible to receive AppleShare Server 3.0 at no charge.

- The customer is required to mail (to the address indicated on the coupon):
  - 1) The AppleShare coupon (obtained from an authorized Apple Reseller);
  - 2) An original, dated, itemized sales invoice as proof of purchase; and
  - 3) Their original AppleShare File Server 2.0 - Server Installer disk (for each upgrade requested)
- This offer is available for fulfillment through April 1, 1992.

Customers who purchased AppleShare File Server 2.0 prior to October 15, 1991 will be offered a reduction in price to upgrade to AppleShare Server 3.0.

- The customer is required to mail (to the address indicated on the coupon):
  - 1) The AppleShare order form (obtained from an authorized Apple Reseller).
  - 2) Their original AppleShare File Server 2.0 - Server Installer disk (for each upgrade requested), include AppleShare 2.0 Print Server - Server Installer disk if applicable.
  - 3) A certified check or money order for the amount as follows:  
AppleShare 2.0 File Server owners (only)\$299 AppleShare 2.0 File and Print Server owners \$199
- This offer is available for fulfillment through April 1, 1992.

Customers who own ONLY AppleShare 2.0 Print Server are required to purchase the AppleShare Server 3.0 product from an authorized Apple reseller.

## AppleTalk Remote Access: Description

Revised: 10/15/91  
Security: Everyone

AppleTalk Remote Access: Description

=====

Article Created: 15 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

This article describes AppleTalk Remote Access software.

DISCUSSION -----

AppleTalk Remote Access lets a Macintosh computer communicate with another Macintosh computer or AppleTalk network over standard telephone lines. On the remote computer, you can use the file sharing feature of System 7 to access files. You can also print to an AppleTalk network printer connected to the remote computer. Your computer can answer calls as well as call another Macintosh.

All AppleTalk network services become available to you remotely. You can check electronic mail, view your calendar, or retrieve data from a database. It doesn't matter what type of AppleTalk network you use. You can call into LocalTalk, Ethernet, or Token Ring networks. Token Ring requires A/ROSE (TokenTalk, version 2.4).

AppleTalk Remote Access Features

-----

- Easy to set up and use
  - Integrated software combines calling and answering
  - No specialized networking knowledge required
  - Remote services accessed the same way as local services
- Multiple security levels

- User-specified options
- Network-wide control
- High performance
  - Optimized for modems
  - Industry-standard data compression and error detection built in
  - Increased efficiency with smart buffering technology
- No special hardware necessary
  - Works on any System 7 Macintosh
  - Broad range of modem support
  - Functions over standard telephone lines
- Modem Support and Scripts

AppleTalk Remote Access can work with any Apple 2400 bps or any Hayes-compatible 2400 bps or higher-speed modem with the appropriate script. Modem scripts for many popular modems are included with AppleTalk Remote Access:

2400 bps Modems

-----

Apple Data Modems  
Abaton InterFax 24/96  
Global Village TelePort  
Hayes SmartModem 2400  
Microcom Microport 1024  
Practical Peripherals 2400SA  
Prometheus 2400M  
Supra SupraModem 2400  
US Robotics Courier 2400e

9600 bps Modems

-----

DSI 9624LE/LE Plus  
Hayes Ultra 96  
Farallon Remote V.32  
Microcom MacModem V.32  
MultiTech MultiModem V.32  
Practical Peripherals 9600SA  
Prometheus ProModem Ultima  
Telebit T1600  
US Robotics Courier V.32bis

Programmers who understand connection control languages (CCLs) can write the necessary modem script. The AppleTalk Remote Access Modem Toolkit includes everything needed to write these scripts, and is available from APDA.

## System 7: PrintMonitor Problem when Quitting Foreground App

Revised: 9/22/92  
Security: Everyone

System 7: PrintMonitor Problem when Quitting Foreground App

=====

Article Created: 8 October 1991

### Article Change History

-----

09/22/92 - UPDATED

- To add information about System 7 Tune-Up.

### TOPIC -----

Why does PrintMonitor sometimes crash when I quit the application that produced the print job?

### DISCUSSION -----

This is a known problem in the 7.0 Process Manager, which fails to keep the driver open when it shuts down the foreground application. You can avoid this problem by not quitting out of the foreground application (the one from which you requested the print) while PrintMonitor is in the process of printing.

But this problem has been solved with the LaserWriter driver version 7.1.1 (or later), found on the System 7 Tune-Up disk. To avoid the problem in the future, upgrade to this version of the LaserWriter. If you suspect your copy of PrintMonitor has already been damaged, replace it as well.

AppleTalk Remote Access: Connection Document

=====

Article Created: 15 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

What is the Connection Document?

DISCUSSION -----

A blank connection document appears when you double-click the Remote Access application. AppleTalk Remote Access uses the document when initiating a connection. The connection document specifies the caller's name, password, and phone number of the server Macintosh.

You can save all the configuration information to use later. You can choose whether to save the password with the connection document.

You can also set the time interval between active-connection reminders. This is helpful if you're concerned about phone charges. The default is no reminder.

## AppleTalk Remote Access: Modem CCL Files

Revised: 10/15/91  
Security: Everyone

AppleTalk Remote Access: Modem CCL Files

=====

Article Created: 15 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Where do the modem CCL files go during AppleTalk Remote Access installation?

DISCUSSION -----

The installation process places the modem Connection Control Language (CCL) scripts in the Extensions folder. The scripts appear in the pop-up menu in the Remote Access Setup control panel.

Advanced users can look at the CCL scripts by changing the file type from "mlts" to "TEXT" and reading it with any application that reads text files. A HyperCard stack is available to assist in the development of CCL files. This Modem Workshop tool allows you to interactively edit, run, and monitor CCL scripts.

Installation also places the AppleTalk Remote Access and MNPLink Tool extensions in the Extensions folder. These extensions create and maintain a reliable connection.

AppleTalk Remote Access: Network adev (Remote Only)

=====

Article Created: 15 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

What is the AppleTalk Remote Access Remote Only adev?

DISCUSSION -----

The Remote Only adev (AppleTalk device) is installed in the Extensions folder and appears in the Network CDev. You can disconnect from the local network and see only the remote network. Here are two situations where you might need to do this:

- In the Event of a Network Number Conflict

When a resource on the remote network has the same number as a resource on the local network, you can access the remote resource using the Remote Only adev.

- When You Have a Printer Port, and No Other Network Connections

When you must use the printer port for something other than AppleTalk, you can use the Remote Only adev to free up the printer port. For example, a non-networked Macintosh with a serial printer connected to the printer port and a modem connected to the modem port.

## AppleTalk Remote Access: Security

Revised: 10/15/91  
Security: Everyone

AppleTalk Remote Access: Security

=====

Article Created: 15 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

AppleTalk Remote Access implements security in several ways, at the Macintosh level and at the network level.

DISCUSSION -----

### Macintosh Level Security

-----

You can implement security from the Macintosh in these ways:

- Assign each user a password in the User record in the Users and Groups file. When receiving a call, the password goes through a DES encryption and authentication procedure similar to AppleShare.
- Set AppleTalk Remote Access to call the user back at a predetermined number. If an unauthorized caller discovers a password, the call-back number will connect only the authorized phone number.
- Disable access to the network so the caller can't see beyond the server Macintosh. Turn off file sharing to deny access to the server Macintosh as well.
- Find the number of failed log-on attempts in the activity log.
- Disable the user's access after seven log-on attempts.

### Network Level Security

-----

The network administrator can set up a Security Zone using a HyperCard stack. The Remote Access Setup CDev detects this Security Zone, and

requires a password to answer incoming calls. Unauthorized AppleTalk Remote Access servers can grant access to a network only after clearance from the network administrator.

Security: Everyone

AppleShare 3.0.3: Description (11/95)

=====

Article Created: 15 October 1991  
Article Reviewed/Updated: 4 November 1995

TOPIC -----

This article describes the new features of AppleShare 3.0.3.

DISCUSSION -----

AppleShare 3.0.3 contains both file and printing services in one package. It requires System 7. Memory and available CPU cycles determine the limit for running other applications on the same computer. AppleShare 3.0.3 is 32-bit clean and virtual memory compatible. A Macintosh can become a network server that provides shared file storage for up to 120 concurrent users, and queued access to five network printers. AppleShare 3.0 supports the multitasking feature of System 7, so other servers and application programs can run at the same time as AppleShare on one Macintosh.

### AppleShare Print Server

-----

This application runs under MultiFinder, and manages access of up to five networked printing devices. You install it in the System Folder with the ImageWriter Emulator (IWEM).

### AppleShare File Server

-----

AppleShare 3.0 requires at least a Macintosh Plus computer, with a recommended minimum of 4MB of RAM. Apple tested the server on the Macintosh Portables for basic functionality only. Apple hasn't tested for stress on Macintosh Portables running as AppleShare servers.

### Features

- 
- Increased maximum number of connected users from 50 to 120.
  - Guest Access Default set to Off for new installation.

- Continuous Parallel Data Structure (PDS) maintenance. This allows mounting and unmounting removable media (like CD-ROMs) while the server is running.
- Shared volumes and folders have dynamic access privileges, according to where they are created or moved.
- A User can belong to as many as 42 groups (increased from 16).
- Maximum Remote User Activity meter to customize response time.
- The administrator can write and send Greeting, User, and Disconnect User messages.
- The User dialog box allows multiple super users and IAC events.
- The File Server Preferences dialog box allows the administrator to control the number of connections, password characteristics, and log-on attempts.
- The User Setup dialog box allows the administrator to force users to change their passwords.
- The Access Information dialog box gives the ability to lock and copy-protect files, and limit the number of simultaneous application launches.
- The Compact Volume Access Privileges menu speeds up file service startup.
- Administrator messaging
- Print spooling

AppleShare File Server allows Macintosh, Apple II, and MS-DOS computers to access the same documents. AppleShare also allows background printing on networked LaserWriters or ImageWriters.

AppleTalk Remote Access: Requirements and Components

=====

Article Created: 15 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

This article describes the connection and client/server characteristics, requirements, and components of the AppleTalk Remote Access software.

DISCUSSION -----

### The Connection and Client/Server Characteristics

-----

AppleTalk Remote Access provides an asynchronous AppleTalk connection through a modem to another Macintosh and its AppleTalk network. The remote user can access all the AppleTalk services such as mail, calendars, file servers, and printers. The software is meant for personal use, and it is easy to set up and configure. It supports one connection at a time.

This software can act as client or server. AppleTalk Remote Access behaves as a node on its local network as well as the remote network, and has access to all services on both networks. As a client on the remote network, it doesn't allow the rest of the remote network to gain access to its local network. In other words, it doesn't create two-way access between networks.

### Requirements

-----

For optimum performance, Apple recommends using a V.32 capable 9600 bps or faster modem. A 2400 bps modem provides satisfactory access to on-line mail services or calendaring systems. Connection speeds slower than 2400 bps are likely to cause AppleTalk to time-out between packets. The software supports connection speeds of 2400, 9600, and 19200 bps. It requires System 7 or later, but runs on any CPU capable of running System 7. AppleTalk Remote Access supports built-in serial ports, not serial

cards.

#### Components

-----

- Remote Access Application is the main application that functions to set up, monitor, and control connection.
- Remote Access Setup is a control panel device (cdev) that selects and controls the modem, and connection to a network.
- Users & Groups File uses System 7 file sharing to control access.
- Connection Document provides the information used to initiate a connection.
- Status Window shows the current status of AppleTalk Remote Access.
- Activity Log maintains a log of incoming and outgoing calls and connections.
- Network adev (Remote Only) allows you to disconnect from the local network and see only the remote network.
- Connection Control Language (CCL) scripts.
- MNPLink Tool extensions create and maintain a reliable connection.
- Security at the Macintosh and network levels.

The AppleTalk Remote Access application must be open to see the connection document, status window, and activity log. The other components are independent of the application.

AppleShare 3.0: Compact Volume Access Privileges Menu

=====

Article Created: 15 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Using the Compact Volume Access Privileges menu, an administrator can perform Parallel Data Structure (PDS) compaction on a volume.

DISCUSSION -----

PDS compaction removes PDS entries derivable from their parent, and gives dynamic access privileges. File service starts up faster after compaction. This operation is safe to do on CD-ROMs because it's impossible to drag folders to another location.

## AppleShare 3.0: Using Maximum Remote User Activity Meter (3/93)

Revised: 3/9/93  
Security: Everyone

AppleShare 3.0: Using Maximum Remote User Activity Meter (3/93)

Article Created: 15 October 1991

### Article Change History

03/02/93 - UPDATED

- To include more information on Maximum Remote User Activity.

### TOPIC -----

In AppleShare 3.0.x, the administrator can customize the response time using the Maximum Remote User Activity meter.

### DISCUSSION -----

AppleShare File Server activity affects the performance of other applications and services running on the server, and vice versa. The administrator can adjust total system performance using the Maximum Remote User Activity meter. Changes take effect immediately. The default setting is 100%.

Setting the slider to 100% allows the server to access 100% of the available CPU cycles. This doesn't lock out any other running application. Set to 50%, the server uses every other available cycle from the CPU. This is true whether an application uses the other 50% or not.

### Recommended Slider Setting

It appears that there are too many variables in making a recommendation on the setting when an AppleShare file server is running in conjunction with another network service such as a print server or mail server. The optimal slider setting in this situation must be determined through trial and error.

The AppleShare 3.0.x file server keeps track of CPU usage. That is,

AppleShare knows what percentage of the CPU that remote AFP requests are responsible for. Internally, AppleShare uses a complex scheduling algorithm for tracking and allotting CPU time.

The "Maximum Usage" slider controls what percentage of the CPU that remote AFP requests are allowed. So, what is actually happening when you change the value of the slider is a corresponding variable within the AppleShare scheduler is changed and is then used in scheduler time calculations to determine whether or not to process pending AFP requests.

Example: If the slider were set to 50% and it is determined (by the AppleShare scheduler) that processing another AFP request would result in AppleShare using more than 50% of the CPU and there are currently other processes competing for the CPU, then the scheduler would yield to system processes. Whereas, if the slider were set to 100%, then AFP requests are immediately processed regardless of whether there are other processes waiting for processor time.

As far as recommended settings, it totally depends on how the File/Print Server machine is being used. If it is a dedicated server, then the slider should be set at 100% for maximum server performance. If the machine is only a part time server and you wish to use the machine to run applications and so on, then the slider should be set at a lower value depending on what kind of local performance you desire.

## AppleShare 3.0: Messages from the Administrator

Revised: 10/15/91  
Security: Everyone

AppleShare 3.0: Messages from the Administrator

=====

Article Created: 15 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

In AppleShare 3.0, the administrator can write messages up to 199 characters long, and send three message types.

DISCUSSION -----

The three message types are:

- Greeting Message

AppleShare displays this message at log-on, to inform users of server contents, backup policies, or other news.

- User Message

The administrator can send a custom message to a User or Group.

- Disconnect User

The administrator can send a message to a group of connected users explaining the reason for shut down, or announcing the time service will be restored. The administrator can disconnect a user or group of users without bringing the server down. Disconnection can happen immediately or after a designated time interval.

AppleShare 3.0: Parallel Data Structure Maintenance

=====

Article Created: 15 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Maintenance of the Parallel Data Structure (PDS) in AppleShare 3.0 is a continuous background task rather than a startup task.

DISCUSSION -----

This change has these benefits:

- Faster server startup time
- Improved integrity of the PDS (many other applications can run on the same system, increasing the chance of a server crash)
- Ability to support removable media: The administrator can mount or unmount volumes while the server is running.

AppleShare 3.0: File Server Preferences Dialog Box

=====

Article Created: 15 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

The administrator can ensure network security with the choices in the File Server Preferences dialog box.

DISCUSSION -----

Network Security Choices:

- Set the maximum number of connections. The maximum is 120 and the default is 50. Restart the server to see the new number take effect. AppleShare allocates 2K of memory at startup for each connection.
- Set the minimum number of characters in a password. Eight characters is the maximum and zero is the default.
- Set the number of days until a password expires. When the password expires, users get a prompt to enter a new word if they have the privilege to change passwords. For a temporary account, set the number of days until expiration for the duration of the account and deny the change-password privilege.
- Set the maximum number of failed log-on attempts. This disables the account when someone tries multiple random passwords to gain access. The administrator must reactivate the account.
- Require a password at startup time. This disables the "Save my name and password" option in the Chooser dialog that allows a choice of servers to mount at startup.

## AppleShare 3.0: Sharing Volumes and Folders (6/95)

Revised: 6/9/95  
Security: Everyone

AppleShare 3.0: Sharing Volumes and Folders (6/95)

=====

Article Created: 15 October 1991  
Article Reviewed/Updated: 9 June 1995

TOPIC -----

This article discusses some of the new features of AppleShare 3.0 in terms of volume and folder sharing.

DISCUSSION -----

You can share an entire volume, or selected folders. You can mount a maximum of 50 volumes on the AppleShare server, and share a maximum of 50 entities (volumes or folders).

When a remote user creates a new folder, the folder inherits the access privileges of the surrounding folder or volume unless the owner explicitly changes access. Access privileges used to default to owner only.

When the administrator creates a folder in an area that isn't shared or exported, the folder takes on the access privileges of the surrounding folder when dragged to a shared area. When the administrator moves this folder from the shared area to a new folder, the moved folder takes on the privileges of the new enclosing folder. Folders have this property of dynamic access privileges until the administrator assigns explicit privileges to the folder.

You can interchange Users and Groups so that a User who is not in a Group can share an entity along with the Group, and more than one User can own the same folder. A User can belong to 42 groups (up from 16). You can create over 8000 Users or Groups, but the recommended maximum is 2000.

Here are definitions for explicit and inherit access privileges:

Explicit - Retain access privileges regardless of the enclosing folder.  
Inherit - Always change to reflect access privileges of enclosing folder.

The default on an AppleShare Server is explicit.

Article Change History:

09 Jun 1995 - Added definition of explicit and inherit.

AppleShare Server 3.0: Product Highlights

=====

Article Created: 15 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

This article highlights the most important features of AppleShare Server 3.0.

DISCUSSION -----

### Multiple Service Platform

-----

- System 7 multitasking environment, including support for program linking and publish and subscribe.
- Includes AppleShare file and print services.
- Open environment allows additional network services.

### Administrator Control

-----

- Set number of connected users
- Send server messages to any user
- Share entire hard disks or selected folders
- Change CD-ROMs without shutting down the server
- Adjust file server performance through system caching and control over file server task prioritization

### Security Enhancements

-----

- Minimum password length
- Password aging
- Password history to prevent immediate reuse
- Ability to disallow saved passwords
- Account disable after specified number of password failures
- Adjustable time limit for temporary accounts
- Guest access turned off by default
- Copy-protection setting for documents
- "Lock" setting for folders
- Adjustable number of concurrent application launches\*
- Inherited folder privileges
- Administrator log-off of any user

#### Print Spooling

- Spooling for up to five AppleTalk printers
- Centralized queue management
- Accepts simultaneous print requests
- Reduced user delay
- Print log for 1000 print jobs

#### Maximum Number of...

- |                          |        |
|--------------------------|--------|
| - Concurrent users       | 120    |
| - Open files             | 346    |
| - Shared volumes         | 50     |
| - Users                  | 8192** |
| - Groups                 | 8192** |
| - Users in group         | 8191   |
| - Groups per user        | 42     |
| - Locked ranges per user | 20     |

- Apple II network startups 40

#### AppleShare Access Privileges

-----

- Both the user and the administrator can control access to information
- Eight different access privileges

#### How Users View Shared Data

-----

- Full access privileges
- Drop folder, write capability only
- No access privileges

#### How Users Protect Their Data

-----

- Can't see enclosed folders
- Can't see enclosed files
- Can't write to folder
- Can't write to or see folders
- Can't write to or see files

\* Requires a multilaunch application and appropriate license agreement.

\*\* The sum of users and groups cannot exceed 8192. The recommended limit is 2000.

System 7: Use AppleShare 2.0.2 With System Software 6.0.7

=====

Article Created: 8 October 1991

### Article Change History

-----

09/15/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

I have a Macintosh IIsi with system software version 7.0 installed, and I have a Macintosh SE/30 with system software version 6.0.7 and AppleShare workstation version 7.0 installed.

When I try to access the Macintosh IIsi from the Macintosh SE/30, I get the message, "Disk needs minor repairs. Do you want to repair it?" If I click the "Yes" button, the message just reappears.

### DISCUSSION -----

To correct the problem, remove the System 7 AppleShare extension from the Macintosh SE/30 running system software version 6.0.7, and replace it with AppleShare 2.0.2 workstation software from your 6.0.7 System disk.

## System Software 7.0.1: Questions and Answers

Revised: 9/25/92  
Security: Everyone

System Software 7.0.1: Questions and Answers

Article Created: 21 October 1991

### Article Change History

-----  
09/24/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

This article gives answers to some common questions about system software version 7.0.1.

### DISCUSSION -----

Q: Why did Apple release System Software 7.0.1?

A: Macintosh System Software 7.0.1 incorporates software support for new products introduced on 21 October 1991:

- Macintosh PowerBook 100, 140, and 170
- Macintosh Quadra 700 and 900
- Macintosh Classic II

Q: Why is 7.0.1 required when using these Apple products?

A: These Apple products contain hardware features that require support from the new system software.

Q: Does Apple recommend that everyone upgrade to 7.0.1?

A: No. System 7.0.1 contains only software changes from System 7.0 necessary to support the new products and is not a generally recommended upgrade.

Q: Is System 7.0.1 available in the System 7 upgrade kits?

A: No. Because System 7.0.1 is a hardware support release only, and there is no significant benefit for other Macintosh users, the Personal Upgrade Kit won't change. Customers wishing to upgrade to System 7 can

purchase an upgrade kit containing System 7.0.

However, System 7.0.1 is on the CD-ROM in the Group Upgrade kit to continue providing network administrators all versions of system software.

Q: Can I share a network between Macintosh computers running System 6, System 7.0, and System 7.0.1?

A: Yes. System 7.0.1 co-exists on networks with System 7.0 and System 6 (with updated System 7 printing software).

Q: What version of HyperCard do I need to run with System 7.0.1?

A: HyperCard version 2.1 is required for use with System 7.0.1.

Q: Does 7.0.1 address any problems with System 7.0?

A: No. Apple is very confident in the stability and compatibility of System 7.0.

Q: If I purchase a System 7 upgrade kit, am I entitled to a free copy of 7.0.1?

A: Customers wishing to get copies of System 7.0.1 can do so through electronic bulletin boards, AppleLink, or an authorized Apple dealer.

Q: How else can I get a copy of System 7.0.1?

A: System 7.0.1 is shipped in-the-box with the Macintosh PowerBook 100, 140, and 170; Macintosh Quadra 700 and 900; and the Macintosh Classic II.

For consistency, Apple also rolled over all newly manufactured systems to System 7.0.1 in the United States and Pacific.

Q: Can I get System 7.0.1 on 800K disks?

A: No. As 7.0.1 is specifically a hardware support release, 1.4MB disks only are required for the Macintosh PowerBook 100, 140, and 170; Macintosh Quadra 700 and 900; and the Macintosh Classic II.

#### System Enablers

-----

System Enablers are required for the Macintosh models indicated below with System 7.1 or later. Macintosh computers which require System Enablers will not operate properly with System 7.0.1 or earlier.

This chart shows the appropriate System Enabler for the indicated Macintosh computer:

Begin\_Table

| Macintosh Model | Enabler Name | Use Enabler only with System vers. | Current Enabler Version | Note |
|-----------------|--------------|------------------------------------|-------------------------|------|
|-----------------|--------------|------------------------------------|-------------------------|------|

-----

The Macintosh Plus, SE, SE/30, Classic, Classic II, LC, LC II, LC 580, Mac II, IIX, IICx, IISi, IICI, IIFx, Portable, PB 100/140/145/145B/170, Quadra 700,900 and 950 do NOT need a System Enabler.

|               |                    |     |       |  |
|---------------|--------------------|-----|-------|--|
| Color Classic | System Enabler 401 | 7.1 | 1.0.5 |  |

## PowerBook 170: Display Dimming is Normal

Revised: 5/17/94  
Security: Everyone

PowerBook 170: Display Dimming is Normal

=====

Article Created: 21 October 1991  
Article Reviewed/Updated: 3 August 1992

TOPIC -----

Sometimes I can see the display of my PowerBook 170 getting dimmer. Is this normal?

DISCUSSION -----

Yes. This is a normal condition of the active matrix as the voltage level of the battery decreases.

Here are three levels of brightness to expect:

- With the adapter plugged in, the display is at its brightest.
- Without the adapter plugged in, the brightness drops by about 30%.
- Without the adapter, the display dims automatically at the first dialog box to about half the brightness of the display when the adapter is plugged in.

## PowerBook 140 and 145: How They Differ From 170

Revised: 5/17/94  
Security: Everyone

PowerBook 140 and 145: How They Differ From 170

Article Created: 21 October 1991  
Article Reviewed/Updated: 3 August 1992

TOPIC -----

This article compares the PowerBook 140 and 145 to the PowerBook 170, and lists the feature sets that distinguish them.

DISCUSSION -----

Overview

The PowerBook 140, 145, and 170 computers are notebook-size Macintosh computers. These computers share the same architecture and specifications, with these exceptions: microprocessor speed, amount of on-board RAM, type of display, capacity of the internal hard disk drive, and presence of a coprocessor and an internal modem.

Common Features

The PowerBook 140, 145, and 170 computers are smaller and lighter than the Macintosh Portable and offer improved CPU performance by using a 68030 processor. They are designed to be extremely rugged and portable. Both systems are 11.25 by 9.3 by 2.25 inches and weigh under 7 pounds.

They share a common main logic board, but have different daughter boards for the processor, RAM, and ROM.

PowerBook 140 and 145

The PowerBook 140 and 145 have a 68030 microprocessor. In the PowerBook 140, it runs at 16 MHz; in the PowerBook 145, it runs at 25 MHz.

Both feature a backlit Film Supertwist Nematic (FSTN) display, and a built-in 40MB or 80MB hard disk. They do not include a socket for a 68882 floating-point unit (FPU). Expansion slots (connectors) are provided for RAM cards and

modem cards.

Here are the features specific to the Macintosh PowerBook 140 and 145:

- Microprocessor: 68030 running at 16 or 25 MHz
- Coprocessor: NO 68882 FPU
- Video display: flat-panel, transmissive mode, FSTN LCD (liquid crystal display), 640 x 400 pixels, with on-demand CCFL (cold cathode fluorescent lamp) backlighting
- Hard disk: one internal 40MB or 80MB, 2.5-inch SCSI hard disk
- RAM: 2MB or 4MB
- Modem: Optional

PowerBook 170

-----

The PowerBook 170 has a 68030 microprocessor running at 25 MHz, a 68882 FPU, backlit active matrix display, and built-in 40MB hard disk and 2400 baud modem (USA only). Expansion slots (connectors) are provided for RAM cards and modem cards.

Here are the features specific to the Macintosh PowerBook 170:

- Microprocessor: 68030 running at 25 MHz
- Coprocessor: 68882 FPU
- Video display: flat-panel, transreflective Active Matrix LCD (liquid crystal display), 640 x 400 pixels, with on-demand CCFL (cold cathode fluorescent lamp) backlighting
- Hard disk: one internal 80MB, 2.5-inch SCSI hard disk
- Modem: one internal 20-pin connector with 2400 baud modem card installed; send facsimile capability (USA only, international decision on a country-by-country basis)

## PowerBook Fax/Data Modem: Specifications (6/92)

Revised: 5/17/94  
Security: Everyone

PowerBook Fax/Data Modem: Specifications (6/92)

Article Created: 21 October 1991  
Article Reviewed/Updated: 26 June 1992

TOPIC -----

This article gives the hardware specifications for the Macintosh PowerBook Fax/Data Modem, provided in the "Macintosh PowerBook Fax/Data Modem Developers Guide", which is available from APDA.

DISCUSSION -----

Fax Compatibility

-----

- Group 3 only

Data Format

-----

The data format to use is determined by the software application.

- Protocol: serial, binary, asynchronous
- Parity: odd, even, mark, space, or no parity
- Character length:
  - 7 data bits, 1 parity bit (even, odd, mark, or space parity), and 1 stop bit
  - 7 data bits, no parity, 2 stop bits
  - 8 data bits, no parity, and 1 stop bit

Frequency Tolerance

-----

- Offset frequency: +/-7 Hz

Data Transmission Modes

-----

- Full duplex
- Asynchronous

Fax Transmission Modes

- Half duplex

Compatibility and Modulation

- Full duplex (data communication standards)

| Speed    | Standard      | Modulation |
|----------|---------------|------------|
| -----    | -----         | -----      |
| 300 bps  | Bell 103      | FSK        |
| 1200 bps | Bell 212A     | DPSK       |
| 1200 bps | CCITT V.22    | DPSK       |
| 2400 bps | CCITT V.22bis | QAM        |

- Half Duplex (fax communications standards)

| Speed         | Standard      |
|---------------|---------------|
| -----         | -----         |
| 2400-4800 bps | CCITT V.27ter |
| 7200-9600 bps | CCITT V.29    |

Transmit Carrier Frequencies

- V.22bis, V.22, Bell 212A      Transmit Carrier  
                                         Originate      1200 Hz  
                                         Answer      2400 Hz
- Bell 103      Mark      Space  
                                 Originate      1270      1070  
                                 Answer      2225      2025
- V.21      Mark      Space  
                                 Originate      980      1180  
                                 Answer & Fax      1650      1850
- V.29      Carrier      1700 Hz
- V.27      Carrier      1800 Hz

Guard Tone Frequencies and Transmit Levels (CCITT only)

- 1800 Hz +/-20 Hz      6 +/-dB below the transmit carrier level
- 550 Hz +/-20 Hz      3 +/-dB below the transmit carrier level

Answer Tone Frequency

- V.22bis, V.22, V.21, and fax      2100 Hz
- Bell 103, Bell 212A      2225 Hz

Received Signal Frequency Tolerance

- Offset frequency: +/-7 Hz

#### Calling Tone

-----

- Fax-specific calling tone: 1100 Hz (0.5s on, 3s off with 15% tolerance)

#### V.42bis and MNP Features

-----

- V.42bis and MNP protocols for error correction and data compression apply to V.22, Bell 212, and V.22bis

#### Error Control

-----

- MNP Classes 2 to 4
- CCITT V.42

#### Data Compression

-----

- MNP Class 5
- CCITT V.42bis

These protocols apply to V.22, V.22bis, and Bell 212 (if available in your country)

#### Features

-----

- Auto-dial and auto/manual answer
- Dual-tone multifrequency (DTMF)/pulse dialing
- Extended AT command set
- Low-power design to help preserve Macintosh PowerBook battery power

#### Operating Environment

-----

- Ambient temperature: 38 to 125 degrees F (5 to 65 degrees C)
- Relative humidity: up to 95% (non-condensing)
- Optimal humidity range: 0 to 75%

#### Power Requirements

-----

- +5V +/-5% supplied by Macintosh PowerBook
- -5V +/-5% supplied by Macintosh PowerBook

#### Power Consumption

-----

- Operational mode: 750 mW typical
- Macintosh PowerBook sleep state: 0 mW

#### Electrical Requirements

-----

- Line voltage: 110 to 220 volts
- Frequency: 50 to 60 Hz

#### Physical Characteristics

-----

- Board for internal installation with one mini-DIN connector and external RJ11 jack
- Modem size: 96x36 mm

## PowerBook: Apple Peripheral Products (7/92)

Revised: 5/17/94  
Security: Everyone

PowerBook: Apple Peripheral Products (7/92)

Article Created: 21 October 1991  
Article Last Reviewed: 31 July 1992

TOPIC -----

This article gives brief descriptions of peripheral products for the Macintosh PowerBook computers.

DISCUSSION -----

### Memory Expansion Kits

Macintosh PowerBook memory expansion kits increase system memory to work with advanced Macintosh applications, with or large spreadsheets, scanned images, and sound files. The 2MB and 4MB memory expansion kits expand any Macintosh PowerBook computer to a system with up to 6MB of RAM. Dealer installation is required.

### Fax/Data Modem

The Fax/Data Modem allows information exchange with other computers, and sends facsimile transmissions. Communicate with any standard modem operating at 2400, 1200, or 300 baud, and send facsimiles at 9600 baud. This low-power modem fits inside the PowerBook 100, 140, and 170, and can operate unattended for receiving files while you are away from the computer. Two versions are available: one for use in the U.S., Canada, and Japan, and one for use in Europe, Australia, and some South American countries. Dealer installation is required.

### HDI-20 External 1.4MB Floppy Disk Drive

The Macintosh HDI-20 External 1.4MB Floppy Disk Drive gives the PowerBook 100 access to high-capacity disk storage including 400K, 800K, and 1.4MB Macintosh- and DOS-formatted disks. It plugs directly into the computer's floppy disk drive port.

### Apple HDI-30 SCSI Disk Adapter and System Cable

-----  
The Apple HDI-30 SCSI Disk Adapter allows you to use a Macintosh PowerBook 100 computer as an external hard disk with another Macintosh system, for high-speed file transfer or system recovery.

The Apple HDI-30 SCSI system cable connects a PowerBook 100, 140, or 170 to any SCSI peripheral device, such as a CD-ROM drive, scanner, tape backup, or hard disk. You can connect up to five SCSI devices to the PowerBook at once, allowing a total of seven devices on the SCSI chain.

#### Rechargeable Batteries

-----

The Macintosh PowerBook 140/170 rechargeable battery is a nickel-cadmium battery that provides two to three hours of use for the PowerBook 140 and PowerBook 170 notebook computers before recharging. You can recharge it hundreds of times before it needs replacing.

The Macintosh PowerBook 100 rechargeable battery is a sealed lead-acid battery that provides two to four hours of use. It can be fully recharged hundreds of times before it needs replacing.

#### Battery Rechargers

-----

The Macintosh PowerBook 140/170 battery recharger recharges one or two nickel-cadmium batteries for the PowerBook 140 or PowerBook 170 computer to full power in just a few hours. An AC adapter (see below) is required.

The Macintosh PowerBook 100 battery recharger recharges the sealed lead- acid battery to full power in a few hours. It charges two batteries at once. An AC Adapter (see below) is required.

#### AC Adapter

-----

The Macintosh PowerBook AC Adapter recharges batteries without having to unplug and remove the computer's adapter. Additional adapters make it easy to use a PowerBook computer at different locations. You can use it in any country without transformers; it needs just a simple plug adapter.

Security: Everyone

PowerBook 140 and 145: Description (7/93) (Discontinued)

=====

Article Created: 21 October 1991  
Article Reviewed/Updated: 14 July 1993

TOPIC -----

This article describes the Macintosh PowerBook 140 and 145 notebook computers. The only difference between the 140 and the 145 is the clock speed of their 68030 microprocessors. Note that the PowerBook 145B is functionally equivalent to the 145; in most cases a reference to the PowerBook 145 also applies to the 145B.

Note: With the PowerBook 145 and System 7.0.1, when you choose About This Macintosh... from the Apple menu, you'll see a window labeled "PowerBook 140". System 7.1 corrects this.

DISCUSSION -----

The Macintosh PowerBook 140 and 145 fit easily inside a briefcase. They're ergonomically designed with an integrated trackball and palm rest to work with easily on your lap. You can adjust the standard-size keyboard and full page-width display.

The PowerBook 140 and 145 offer greater performance than the PowerBook 100. They have a built-in floppy disk drive that accommodates Macintosh, MS-DOS, OS/2, and ProDOS formats.

Built-in features:

- Networking capability that gives access to all the resources in an AppleTalk network.
- Six built-in ports to plug the PowerBook 140 or 145 directly into high-capacity hard disks, printers, and input devices.
- An optional modem sends electronic mail, accesses information on other

computers, connects to an AppleTalk network, and sends documents to facsimile machines.

- Built-in sound-input capability.
- Processor: 16 MHz 68030 microprocessor (PowerBook 140)  
25 MHz 68030 microprocessor (PowerBook 145)
- 2MB (on the 140) or 4MB RAM, expandable to 8MB
- Expansion: Six built-in ports for peripherals  
Internal slots for modem and RAM
- Display: Backlit Supertwist, 640 by 400 pixels
- System Software 7.1, with multitasking, file sharing, Balloon Help, and TrueType fonts
- Networking: Built-in AppleTalk networking  
File sharing without a dedicated server
- Compatibility: Macintosh, MS-DOS, OS/2, and ProDOS floppy disk formats

#### Article Change History:

14 July 1993 - Updated to include PowerBook 145B.

PowerBook 140: Specifications (Discontinued)

=====  
Article Created: 21 October 1991  
Article Reviewed/Updated: 22 March 1995

TOPIC -----

This article gives technical specifications for the Macintosh PowerBook 140 notebook computer.

DISCUSSION -----

### Microprocessor

-----

- 68030, running at 16 MHz

### Address and Data Bus

-----

32-bit Address Bus  
32-bit Data Bus

### Memory

-----

- Comes with 2MB or 4MB pseudostatic RAM on the logic board and one memory expansion slot.
- Expandable to 8MB of RAM by installing a RAM expansion card in the expansion slot.

### Disk Storage

-----

- One built-in 1.4MB drive that uses high-density floppy disks; it reads, writes, and formats Macintosh, MS-DOS, OS/2, and ProDOS disks.
- One internal 40MB or 80MB hard disk

### Display

-----

- 10 inch (254 mm) diagonal
- Backlit Supertwist liquid crystal display
- 640 by 400 pixels

#### Battery

-----

- NiCad, 2.5 ampere-hours, provides 2 to 3 hours of use before recharging is necessary
- Recharge time: 100% recharged after 5 hours; 80% recharged after 3 hours

#### Keyboard

-----

- Built-in keyboard with standard Macintosh layout
- Two-level tilt adjustment

#### Trackball

-----

- Dual-button trackball, 30 mm diameter,

#### Clock/Calendar

-----

- CMOS custom chip with long-life lithium battery

#### Interfaces

-----

- One Apple Desktop Bus (ADB) port for keyboard, mouse, and other devices using a low-speed, synchronous serial bus
- Two RS-422 serial ports for LocalTalk networking, printers, modems, and other devices
- One HDI-30 SCSI port for hard disks, scanners, CD-ROM drives, and other devices
- One sound output port for external audio amplifier
- One sound-in port

#### Modem

-----

- Optional internal 2400-baud modem with facsimile send at 9600 baud; includes facsimile send software
- Error correction and compression: MNP 4, 5 and V.42, V.42bis

#### Sound Generator

-----

- Apple Sound Chip provides 8-bit sound, capable of driving stereo

headphones or other stereo equipment through the sound port.

#### Sound Input

-----

- 8-bit sound, sampled at 11 or 22 kHz

#### Disability Access

-----

- CloseView, Easy Access, and visible beep included with system software. These built-in solutions and third-party options provide alternative input and output devices for people with disability.

#### ADB Power Requirements

-----

- Maximum current draw for all ADB devices is 200 milliamps (a maximum of three ADB devices is recommended)

#### Electrical Requirements

-----

- Line voltage: 100 to 240 volts
- Frequency: 50 to 60 Hz

#### Environmental Requirements

-----

- Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)
- Storage Temperature: -40 to 65° C (-40 to 148° F)
- Relative humidity: 20% to 80% noncondensing
- Altitude: Operating: 3048 m (10,000 ft.) maximum  
Shipping (non-operating) 0 to 15,000 ft. (0 to 4,722 m)

#### Size and Weight

-----

- Height 2.25 inches (5.7 cm)
- Width 11.25 inches (28.6 cm)
- Depth 9.3 inches (23.6 cm)
- Weight 6.8 lb (3.03 kg)

#### Noise Level

-----

Noise free except for floppy or hard disk use.

#### Article Change History

-----

- 22 Mar 1995 - Updated operating and shipping altitude ratings.
- 02 Jun 1993 - Updated to correct voltage specification.
- 19 Feb 1993 - Updated to correct storage temperature range.

## PowerBook 170: Description (8/92) (Discontinued)

Revised: 6/2/94  
Security: Everyone

PowerBook 170: Description (8/92) (Discontinued)

Article Created: 21 October 1991  
Article Reviewed/Updated: 3 August 1992

TOPIC -----

This article describes the Macintosh PowerBook 170 notebook computer.

DISCUSSION -----

The Macintosh PowerBook 170 offers high performance and flexibility and is small enough to fit inside a briefcase. It includes a CPU, full-size screen and keyboard, trackball, battery, and disk storage.

It is comfortable to work with because of its integrated trackball and palm rest, and you can adjust the standard-size keyboard and full-page-width screen. It runs applications up to 50 percent faster than the PowerBook 140. It comes standard with 4MB of RAM and a built-in modem.

The PowerBook 170 provides the connections for built-in networking and six built-in ports for access to high-capacity hard disks, printers, and input devices.

The built-in modem sends electronic mail, accesses information on other computers, connects to an AppleTalk network, and sends documents to facsimile machines. It has built-in sound input to include sounds from different sources.

### Macintosh PowerBook 170 Features

- Processor: 25 MHz 68030 microprocessor  
25 MHz 68882 math coprocessor
- Memory: 4MB of RAM, expandable to 8MB
- Expansion: Six built-in ports for peripherals  
Internal slots for modem and RAM

- Display: Backlit active matrix, 640 by 400 pixels
- Modem: 2400-baud data, 9600-baud facsimile send

#### Features Built Into Every Macintosh

- Usability: Runs thousands of Macintosh applications
- System software: System 7.0.1, with multitasking, file sharing, Balloon Help, and TrueType fonts
- Networking: Built-in AppleTalk networking  
File sharing without a dedicated server
- Compatibility: Macintosh, MS-DOS, OS/2, and ProDOS floppy disk formats

## PowerBook 100: How it Differs from Macintosh Portable (8/92)

Revised: 5/16/94  
Security: Everyone

PowerBook 100: How it Differs from Macintosh Portable (8/92)

=====

Article Created: 21 October 1991  
Article Reviewed/Updated: 30 April 1993

TOPIC -----

This article describes the Macintosh PowerBook 100 features and how they differ from those of the Macintosh Portable.

DISCUSSION -----

The Macintosh PowerBook 100 is the entry-level notebook Macintosh. It has many of the features of the Macintosh Portable, but in a lighter and smaller enclosure. The main differences are that the PowerBook 100 does not have a processor direct slot, ROM expansion slot, internal floppy drive, nor an external modem serial connection. The display is Supertwist instead of active matrix display.

The Macintosh PowerBook 100 has a new feature, SCSI disk mode. This mode allows another Macintosh to mount the internal hard disk drive. This mode requires a special SCSI disk mode adapter. The ROM contains the firmware for this mode. No other Macintosh has this feature.

The basic performance is the same as the Macintosh Portable. This is approximately twice the performance of a Macintosh Classic.

PowerBook 100: Description (8/92) (Discontinued)

Article Created: 21 October 1991  
Article Reviewed/Updated: 3 August 1992

TOPIC -----

This article describes the Macintosh PowerBook 100 notebook computer.

DISCUSSION -----

The Macintosh PowerBook 100 is small enough to fit in a briefcase, yet gives you the use of applications on a Macintosh. The self-contained trackball and palm rest allow you to work anywhere. You can adjust the bright display and the standard-size keyboard to work in any environment.

Built-in networking allows access to an AppleTalk network. Five built-in ports give you plug-and-play connections to high-capacity hard disks, CD-ROM drives, printers, and input devices. With the external floppy disk drive, you can work with data files stored in Macintosh, MS-DOS, OS/2 and ProDOS formats. The optional modem allows you to send electronic mail, access information on other computers, and send documents to facsimile machines.

### Macintosh PowerBook 100 Features

- Processor: 16 MHz 68HC000 microprocessor
- Expansion: Five built-in ports for peripherals
  - Internal slots for modem and RAM
  - Optional SCSI disk adapter allows the computer to be used as an external hard disk.
- Usability: Runs thousands of Macintosh applications
  - Easy to set up, learn, and use
- System software: System 7.0.1, with multitasking, file sharing, Balloon Help, and TrueType fonts

- Networking: Built-in AppleTalk networking  
File sharing without a dedicated server
- Compatibility: Macintosh, MS-DOS, OS/2, and ProDOS floppy disk formats

PowerBook 100: Specifications (Discontinued)

=====  
Article Created: 21 October 1991  
Article Reviewed/Updated: 22 March 1995

TOPIC -----

This article gives technical specifications for the Macintosh PowerBook 100 notebook computer.

DISCUSSION -----

### Microprocessor

-----  
68HC000, running at 16 MHz  
Address Bus: 24-bit  
Registers (32-bit): 17  
Addressing Modes: 14

### Memory

- 
- Comes with 2MB pseudostatic RAM on the logic board, and one memory expansion slot.
  - Expandable to 8MB of RAM by installing a RAM expansion card in the expansion slot.

### Disk storage

- 
- One internal 20MB SCSI hard disk
  - External 1.4MB floppy disk drive; reads, writes, and formats Macintosh, MS-DOS, OS/2 and ProDOS disks

### Display

- 
- 9 inch (229 mm) diagonal

- Backlit Supertwist liquid crystal display
- 640 by 400 pixels

#### Battery

-----

- Sealed lead-acid, 2.3 ampere-hours, provides 2 to 4 hours of use before recharging is necessary
- Recharge time: 3 hours
- Three non-rechargeable disk-type Lithium backup batteries (type CR-2430)

#### Keyboard

-----

- Built-in keyboard with standard Macintosh layout
- Two-level tilt adjustment

#### Trackball

-----

- dual button trackball, 25 mm diameter

#### Clock/calendar

-----

- CMOS custom chip with long-life lithium battery

#### Interfaces

-----

- One Apple Desktop Bus (ADB) port for low-power keyboard, mouse, and other devices using a two-speed, synchronous serial bus
- One RS-422 serial port for LocalTalk networking, printers, modems, and other devices
- One HDI-30 SCSI port for hard disks, scanners, CD-ROM drives, and other devices
- One monophonic sound output port for external audio amplifier
- One HDI-20 floppy disk drive port for the external 1.4MB floppy disk drive

#### Modem

-----

- Optional internal 2400-baud data modem with facsimile at 9600 baud; includes facsimile send software
- Error correction and compression: MNP 4, 5 and V.42, V.42bis

#### Sound generator

-----

## PowerBook 100: Support Issues (8/92)

Revised: 5/16/94  
Security: Everyone

PowerBook 100: Support Issues (8/92)

=====

Article Created: 21 October 1991  
Article Reviewed/Updated: 3 August 1992

TOPIC -----

This article discusses some of the support issues for the Macintosh PowerBook 100.

DISCUSSION -----

### Hard Disk Recovery

-----

The low end marketing bundle does not include an external floppy disk drive. File sharing or SCSI disk mode will transfer data to and from a desktop Macintosh.

If you rely only on file sharing for file transfer, you may not be able to recover the internal hard disk drive. For example, if the System Folder is corrupted or the hard disk needs repair, file sharing can't connect to the Macintosh PowerBook 100. You need a SCSI disk adapter cable or an external floppy disk drive to connect.

### Hard Disk Interleave Factor Mismatch

-----

If another Macintosh initializes the hard disk while the Macintosh PowerBook 100 is in its SCSI disk mode, it may set the interleave factor incorrectly for the PowerBook 100. The PowerBook 100 has an interleave factor of 1. If, for example, a Macintosh Classic initializes the hard disk drive over SCSI disk mode, the default is an interleave factor of 3. This causes some inefficiencies when accessing the hard disk drive.

To work around this, you can force the Hard Disk Setup Utility to initialize with an interleave factor of 2. Type Command-I when the application is open. This brings up a dialog box that allows you to change the interleave factor.

No Support of System Peripheral Cable for File Sharing

-----  
This is an old issue from the days of connecting a LaserWriter to a Macintosh in a non-networked environment. You can't use the peripheral cable (Mini DIN-8 to Mini DIN-8, M0197) for connecting AppleTalk devices. You can use a peripheral cable in a point-to-point connection instead of two AppleTalk drop boxes and the cabling. This is a lower-cost solution, but Apple has not tested this configuration and does not guarantee future compatibility of this method for connecting two AppleTalk devices.

Macintosh Quadra 700: Description (Discontinued)

=====

Article Created: 21 October 1991  
Article Last Reviewed: 5 August 1992  
Article Last Updated:

TOPIC -----

This article describes the Macintosh Quadra 700 computer.

DISCUSSION -----

The Quadra 700 is designed with a 25 MHz Motorola 68040 microprocessor, faster graphics architecture, and enhanced NuBus and SCSI subsystems. It runs applications up to twice as fast as the Macintosh IIfx.

Built-in features, such as built-in video and on-board Ethernet, provide direct access to networks and peripheral equipment. You can connect directly to high-speed Ethernet and LocalTalk networks. It is compatible with all Apple monitors. Using VRAM, the Quadra 700 supports up to 24 bits of color for photographic-quality images. Nine built-in ports allow access to printers, scanners, high-capacity disk drives, and other peripheral equipment.

The Quadra 700 supports up to 20MB of RAM to work with larger files and many open applications. You can add media integration, or data acquisition coprocessor cards, using the two NuBus expansion slots. There is one in-line 68040 Processor Direct Slot.

### Macintosh Quadra 700 Features

-----

- Power and speed: 25 MHz 68040 microprocessor runs applications up to twice as fast as the Macintosh IIfx.
- Memory: 4MB RAM, expandable to 20MB
- Expansion: Nine built-in ports for peripherals

Two expansion slots

- Display: Built-in support for all Apple monitors  
32 bits per pixel for true color
- Usability: Runs thousands of Macintosh applications  
Easy to set up, learn, and use
- System software: System 7, with multitasking, file sharing, Balloon Help,  
and TrueType fonts
- Networking: Built-in LocalTalk  
File sharing without a dedicated server
- Compatibility: Macintosh, MS-DOS, OS/2, and ProDOS floppy disk formats

Macintosh Quadra 700: Specifications (Discontinued 3/93)

=====

Article Created: 21 October 1991

### Article Change History

-----

08/05/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

This article gives the technical specifications for the Macintosh Quadra 700 computer.

### DISCUSSION -----

#### Microprocessor

- 
- Motorola 68040, 32-bit architecture, 25 MHz clock speed
  - Integral Paged Memory Management Unit (PMMU), Floating Point Unit (FPU), and 8-kilobyte cache architecture

#### Memory

- 
- Comes with 4MB of RAM on the logic board and four memory expansion sockets.
  - Expandable to 20MB of RAM by installing 4MB SIMMs in the empty slots.

#### Disk Drives

- 
- Built-in Apple SuperDrive 1.4MB floppy disk drive
  - 80MB, 160MB, or 400MB internal Apple SCSI hard disk drive (optional)

#### Video Display

-----

- Supports all Apple monitors, including:
  - Macintosh 12-inch RGB Display
  - Macintosh 12-inch Monochrome Display
  - AppleColor High-Resolution RGB Monitor
  - Macintosh Portrait Display
  - Macintosh Two-Page Monochrome Monitor
  - Macintosh 21-inch Color Display
- Supports some non-Apple monitors, including VGA, NTSC, and PAL

#### Video RAM

-----

- 512K, upgradable to 2MB for display of more colors or shades of gray

#### Interfaces

-----

- Two Apple Desktop Bus (ADB) ports, supporting a keyboard, mouse, and other devices daisy-chained through a synchronous serial bus
- Two serial (RS-232/RS-422) ports, 230.4 kilobits per second maximum (up to 0.920 megabits per second if clocked externally)
- SCSI bus interface
- Video port to support RGB and monochrome monitors of various sizes and resolutions
- Two internal NuBus expansion slots
- One processor-direct slot provides access to the CPU bus for highest possible performance.
- Stereo sound output port capable of delivering sound to both channels of a stereo device
- Sound input port for monaural sound input
- AUI-15 Ethernet connector

#### Keyboard

-----

- Supports all Apple Desktop Bus keyboards.

#### Mouse

-----

- Apple Desktop Bus Mouse; mechanical tracking, optical shaft, or contact encoding

#### Sound Generator

-----

- Custom Sound Chip drives stereo miniature phone jack headphones or stereo equipment.

#### Clock/Calendar

- Custom chip with long-life lithium battery

#### Microphone

- Electret, omnidirectional; output voltage is 4 millivolts, peak-to-peak, at normal volume.

#### Disability Access

- CloseView, Easy Access, and visible beep included with system software. These built-in features and third-party options provide alternative input and output tools for people with disabilities.

#### Electrical Requirements

- Line voltage: 100 to 240 volts AC, RMS automatically configured
- Frequency: 50 to 60 Hz, single phase
- Power: 50 watts maximum, not including monitor power

#### ADB Power Requirements

- Maximum current draw for all ADB devices: 200 milliamps (a maximum of three ADB devices is recommended)
- Mouse draws 80 milliamps.
- Keyboard draws 25 to 80 milliamps, depending on the keyboard model used.

#### Operating Environment

- Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)
- Storage temperature: -40 to 116.6 degrees F (-40 to 47 degrees C)
- Relative humidity: 20% to 80 % noncondensing
- Maximum altitude: 10,000 ft. (3,048 m)

#### Size and Weight

- Main unit
  - Width 11.9 inches (30.2 cm)
  - Height 5.5 inches (14.0 cm)
  - Depth 14.4 inches (36.5 cm)
  - Weight 13 lb. 10 oz. (6.2 kg)\*
- Mouse
  - Height 1.1 inches (2.8 cm)

- Width 2.1 inches (5.3 cm)
- Depth 3.8 inches (9.7 cm)
- Weight 6 oz. (.17 kg)

Noise Level

-----

< 40 db measured from the seated operator position.

## Macintosh Quadra 700: Support Issues

Revised: 8/6/92  
Security: Everyone

Macintosh Quadra 700: Support Issues

=====

Article Created: 21 October 1991  
Article Last Reviewed: 5 August 1992  
Article Last Updated:

TOPIC -----

This article discusses some of the Quadra 700 support issues.

DISCUSSION -----

Processor Cooling

-----

The Quadra 700 is designed with special cooling considerations for the 68040. For the processor to cool properly, the case must be closed whenever the Quadra 700 is running.

VRAM Bank Order

-----

The VRAM banks must be populated in order. If there is a VRAM upgrade, the SIMM slots should be populated from the back of the CPU to the front.

SIMM Slots

-----

The placement of the SIMM slots under the hard drive makes it unlikely that vendors will be able to develop 16MB SIMMs to work on this computer.

Article Last Updated:

TOPIC -----

This article describes the Macintosh Quadra 900 computer.

DISCUSSION -----

The Macintosh Quadra 900 runs applications up to twice as fast as the Macintosh IIfx, with these features:

- Increased performance of the 25 MHz Motorola 68040 microprocessor
- Faster graphics architecture
- Improved SCSI and NuBus capabilities

The Quadra 900 has many built-in features. Built-in networking allows you to plug the system directly to high-speed Ethernet and LocalTalk networks without buying additional cards. Built-in support for all Apple displays makes it easy to connect your display without adding video cards. With built-in support for up to 24 bits of color, you can work with photographic-quality images. Ten built-in ports give access to printers, scanners, high- capacity disk drives, and more.

The Quadra 900 supports up to 64MB of RAM, so you can work with larger files and many open applications. There are five expansion slots for adding NuBus cards. The Quadra 900 also supports up to four storage devices. For added security it has a physical key lock.

Macintosh Quadra 900 Features

- 
- Power and speed: 25 MHz 68040 microprocessor runs applications up to

twice as fast as the Macintosh IIfx.

- Memory: 4MB RAM, expandable to 64MB
- Expansion: Ten built-in ports for peripherals  
Up to four storage devices  
Five NuBus expansion slots
- Display: Built-in support for all Apple monitors  
Up to 32 bits per pixel for true color
- Usability: Runs thousands of Macintosh applications  
Easy to set up, learn, and use
- System software: System 7, with multitasking, file sharing, Balloon Help,  
and TrueType fonts
- Networking: Built-in LocalTalk  
File sharing without a dedicated server
- Compatibility: Macintosh, MS-DOS, OS/2, and ProDOS floppy disk formats

- Comes with 4MB of RAM standard and 12 memory expansion slots for SIMMs (Single In-line Memory Modules).
- Expandable to 64MB of RAM by installing 4MB SIMMs in the empty slots.

### Disk Drives

-----

- Built-in Apple SuperDrive 1.4MB floppy disk drive
- 160MB or 400MB internal Apple SCSI hard disk drive (optional)
- Support for up to three additional devices, such as a CD-ROM drive or SCSI hard disk drive (several capacities available)

### Video Display

-----

- Supports all Apple monochrome and color monitors, including:

- Macintosh 12 Inch RGB Display
  - Macintosh 12 Inch Monochrome Display
  - AppleColor High-Resolution RGB Monitor
  - Macintosh Portrait Display
  - Macintosh Two-Page Monochrome Monitor
  - Macintosh 21 Inch Color Display
- Supports some other non-Apple monitors, including VGA, NTSC, and PAL.

#### Video RAM

- 
- 1MB, upgradable to 2MB for display of more colors or shades of gray

#### Interfaces

- 
- One Apple Desktop Bus (ADB) port, supporting a keyboard, mouse, and other devices daisy-chained through a synchronous serial bus
  - Two serial (RS-232/RS-422) ports, 230.4 kilobits per second maximum (up to 0.920 megabits per second if clocked externally)
  - SCSI bus interface
  - Video port to support RGB and monochrome monitors of various sizes and resolutions
  - Five internal NuBus expansion slots
  - One processor-direct slot provides access to the CPU for highest-possible performance.
  - Stereo sound output port capable of delivering sound to both channels of a stereo device
  - Sound input port for monaural sound input
  - Two audio line input ports (Stereo input is mixed to a monophonic signal.)
  - AUI-15 Ethernet connector

#### Keyboard

- 
- Supports all Apple Desktop Bus keyboards.

#### Mouse

- 
- Apple Desktop Bus Mouse; mechanical tracking, optical shaft, or contact encoding

#### Sound Generator

- 
- Custom Sound Chip drives stereo miniature phone jack headphones or stereo

equipment.

#### Clock/Calendar

-----

- Custom chip with long-life lithium battery

#### Microphone

-----

- Electret, omnidirectional; output voltage is 4 millivolts, peak to peak, at normal volume.

#### Disability Access

-----

- CloseView, Easy Access, and visible beep included with system software. These built-in features and third-party options provide alternative input and output tools for people with disabilities.

#### Electrical Requirements

-----

- Line voltage: 100 to 240 volts AC, RMS automatically configured
- Frequency: 59 to 60 Hz, single phase
- Power: 303 watts maximum, not including monitor power

#### ADB Power Requirements

-----

- Maximum current draw for all ADB devices: 500 milliamps (a maximum of three ADB devices is recommended)
- Mouse draws 80 milliamps.
- Keyboard draws 25 to 80 milliamps, depending on the keyboard model used.

#### Operating Environment

-----

- Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)
- Storage temperature: -40 to 116.6 degrees F (-40 to 47 degrees C)
- Relative humidity: 20% to 80% noncondensing
- Maximum altitude: 10,000 ft. (3,048m)

#### Size and Weight

-----

- Main unit
  - Height 18.6 inches (47.3 cm)
  - Width 8.9 inches (22.4 cm)
  - Depth 20.6 inches (52.3 cm)
  - Weight 36 lb. 12 oz. (16.7 kg)\*
- Mouse

- Height 1.1 inches (2.8 cm)
- Width 2.1 inches (5.3 cm)
- Depth 3.8 inches (9.7 cm)
- Weight 6 oz. (.17 kg)

\* Weight is greater with an internal hard disk.

#### Noise Level

-----

< 40 db (floor standing position) measured from the seated operator position.

## Macintosh Quadra 900: Support Issues

Revised: 8/6/92  
Security: Everyone

Macintosh Quadra 900: Support Issues

=====

Article Created: 21 October 1991  
Article Last Reviewed: 5 August 1992  
Article Last Updated:

TOPIC -----

This article discusses some of the support issues for the Quadra 900.

DISCUSSION -----

Sound

-----

The existing sound input is 8-bit linear PCM with analog limiting to enhance the power of the signal being digitized. The sample rate may be set for 22 kHz or 11 kHz. Therefore, the results will not be significantly better than a low cost cassette recorder without noise reduction. This level of performance is adequate for voice annotation, but will not produce the best results with music.

Long Memory Checks

-----

When you install large amounts of DRAM, the memory check at startup is lengthy and you may think the machine isn't functioning. There is no message saying that the machine is running memory checks.

Processor Cooling

-----

The Quadra 900 is designed with special cooling considerations for the 68040. For the processor to cool properly, the case must be closed whenever the Quadra 900 is running.

## Macintosh Classic II & Macintosh Classic:Comparison (8/96)

Revised: 8/19/96  
Security: Everyone

Macintosh Classic II & Macintosh Classic:Comparison (8/96)

Article Created: 21 October 1991  
Article Reviewed/Updated: 19 August 1996

TOPIC -----

This article describes enhancements in the Macintosh Classic II, as compared to the Macintosh Classic.

DISCUSSION -----

Processor

The Macintosh Classic II uses a 68030, 16 MHz CPU, while the Macintosh Classic has a 68000, 8MHz CPU.

RAM

The Classic II comes with 2 MB of RAM and two standard 32-pin SIMM sockets to add RAM configurations of 2, 4, 6 or 10 megabytes using standard SIMM modules with 100ns or better access time. The Macintosh Classic can have a maximum of 4 MB of RAM.

ROM

The Macintosh Classic II ROM is a modified version of the Macintosh LC ROM that supports virtual memory and 512 pixels x 342 pixels x 1 bit video. It comes with a 512K ROM, expandable to 4 MB using the on-board FPU/ROM connector.

Analog Board

These are the changes made to the Macintosh Classic analog board for use in the Macintosh Classic II:

- The width adjust coil replaced by a potentiometer.

- A new low-radiation flyback transformer added.

#### Other Differences

-----  
The Macintosh Classic II comes with a microphone for sound input.

The Macintosh Classic II has a connector on the logic board that allows you to add a floating-point coprocessor, available from third parties.

The Macintosh Classic II has a monitor yoke with opposing windings (cancellation coils). It requires system software version 7.0.1, and comes in configurations of 2 MB RAM with a 40 MB hard disk, or 4 MB of RAM with an 80 MB hard disk.

## Macintosh Classic II: Description (Discontinued)

Revised: 6/8/94  
Security: Everyone

Macintosh Classic II: Description (Discontinued)

Article Created: 21 October 1991  
Article Last Reviewed: 17 June 1992

TOPIC -----

This article describes the Macintosh Classic II computer.

DISCUSSION -----

The Macintosh Classic II offers many built-in capabilities. You can send electronic mail and share devices like printers using built-in networking with third-party products. You can plug peripherals (such as CD-ROM drives, scanners, and modems) into the built-in ports. The microphone allows you to add voice notes to documents and mail messages.

Applications run more than twice as fast on the Macintosh Classic II as they do on the original Macintosh Classic. You can work with several applications at the same time, and continue working while the computer does other tasks.

The Macintosh Classic II stores the video buffer in system RAM. Video data loads into a buffer in 64-bit chunks by burst mode read. The remaining RAM bandwidth is available to the CPU. The on-board video uses 9.4% or 12.5% of the RAM bandwidth, depending on whether video is active or not. Macintosh Classic II's video supports a frame rate of 60.15 Hz.

The Macintosh Classic II uses main memory for the sound buffer. It maintains a sound buffer in the on-board RAM, located above the video buffer. Like the Macintosh LC, it allows for playthrough which permits an external audio source to mix with computer-generated sound and play out through the speaker or headphone jack. The left and right channel of the stereo phono jack are tied together to produce 2-channel monophonic output.

Macintosh Classic II Features

- 
- Power and Speed
    - 16 MHz 68030 microprocessor

- Memory
  - 2MB or 4MB RAM, expandable to 10MB
  - Virtual memory
- Expansion
  - Seven built-in ports for peripherals such as printers, scanners, and microphone
  - Internal connector for optional math coprocessor
- System Software
  - System 7.0.1, with multitasking, file sharing, Balloon Help, and TrueType
- Networking
  - Built-in AppleTalk networking
  - File sharing without a dedicated server
- Compatibility
  - Macintosh, MS-DOS, OS/2, and ProDOS floppy disk formats

## Apple IIe Card: Compatible Monitors and Projection Pads

Revised: 6/10/92  
Security: Everyone

Apple IIe Card: Compatible Monitors and Projection Pads

=====

Article Created: 6 June 1991  
Article Last Reviewed: 3 June 1992  
Article Last Updated:

TOPIC -----

What Apple monitors work with the Apple IIe Card?

Can I use an LCD projection pads with the IIe card?

DISCUSSION -----

Monitors

-----

The Apple IIe Card supports the following monitors:

- Macintosh 12-inch RGB Display
- Macintosh 12-inch Monochrome Display
- AppleColor 13-inch High Resolution Monitor
- Apple 13-inch Monochrome Monitor
- IBM VGA monitors (those that work with the Macintosh LC, with the correct cable)

In other words, Apple IIe Card supports all monitors that are supported by the Macintosh LC video, including the 13-inch color monitor.

Projection Pads

-----

As for LCD Projection Pads, we have only tried the nView ViewFrame II+2. It works with both the 13-inch and the 12-inch monitor. 13-inch projection pads should work, if you have a 13-inch monitor hooked up in-line with the projection pad cable.

Most pads provide a DB-15 female connector to plug into your monitor. The video that the Macintosh LC sends out is based on the monitor sense pins. If the

projection pad can support many different video types, it should work also with a 12-inch monitor connected.

If you have a pad, test it with both the 12-inch and 13-inch monitors. If it works with both monitors, it should work with the Apple IIe card. If the pad has problems with the 12-inch monitor, then it also will have problems with the IIe card.

## Apple IIe: How to Limit Access to the Option Panel

Revised: 6/21/94  
Security: Everyone

Apple IIe: How to Limit Access to the Option Panel

=====

Article Created: 5 June 1991  
Article Reviewed/Updated: 21 Jun 1994

TOPIC -----

I need to limit access to the Apple IIe Option Panel in my school lab.

DISCUSSION -----

You can do so by buying an optional jumper for the Macintosh LC Logic Board. When the jumper is installed on the Macintosh LC logic board, users retain access to these Apple IIe Option Panel buttons:

- Quit IIe
- Eject Disk
- Restart IIe
- Return

However, users will not have access to any of the panels used to change Option Panel settings.

After shutting off the machine and all connected peripherals, put the jumper on the logic board near the battery. There are three sets of pins on the connector. Place the jumper on the pins closest to the battery (labeled CPE or W1 on the board).

This jumper also exists on the Macintosh LCII and Performa 405. However the designation is J17 not CPE.

Article Change History:  
21 Jun 1994 - Added information on the LCII and Performa 405.

## AppleShare Print Server: -120 Error

Revised: 10/18/91  
Security: Everyone

AppleShare Print Server: -120 Error

=====

Article Created: 29 March 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I am having problems with an AppleShare Print Server IINTX. When any of the workstations try to print to the network LaserWriter, the print server instantly aborts the print job. After this, the printer must be reset to be re-captured.

A message comes up on the screen stating that the computer is trying to clear the print buffer. I also get a message stating that error number -120 has occurred. The print server is a Macintosh SE 2/40, and the workstations are Macintosh SE 20s. I have re-installed System software, print-server software, LaserWriter files, and Laser Prep files on both the file server and workstations. What else can I do?

DISCUSSION -----

The -120 error is a "directory not found" error that could be related to a hardware failure on the server. If you can print to the LaserWriter IINTX via the bypass feature of the AppleShare Print Server, then there is a problem at the server level. It is most important to determine that the workstations can print to the IINTX on bypass to verify the integrity of the hardware.

Here are two things to try on the server:

- 1) If you reinstalled the software over the old files, trash the old files first and then re-install.
- 2) Second, consider backing up the server in a file-by-file manner, re-initializing the drive, and restoring the files. The print server may be running into some bad sectors which inhibit its ability to spool the

files.

HyperCard 2.0: Retooling the Limited Version

=====

Article Created: 18 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

How can I access the stack-editing features of the HyperCard that came with my Macintosh?

DISCUSSION -----

The version of HyperCard that ships with the new computers has been set to look like a limited-function version. However, with a couple of alterations, you can make this version run at its full potential. Try any of these three workarounds:

- Type "magic" in the message box the first time you use HyperCard 2.0. (This handler cuts the opaque button from the last card in the Home stack.)
- Go to the last card in the Home stack and cut the opaque button that hides the "set userlevel" buttons. Click the "5" button.
- Type "set userlevel to 5" in the message box, each time you use HyperCard 2.0.

Or, you can buy a copy of full-featured HyperCard 2.0, with manuals, from Claris.

## Macintosh: Power Supply Requires Grounding

Revised: 10/18/91  
Security: Everyone

Macintosh: Power Supply Requires Grounding

=====

Article Created: 12 April 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I need Macintosh systems that work with 220VAC 50Hz with no ground.

DISCUSSION -----

All members of the Macintosh SE and Macintosh II families have universal power supplies. They are all set to work from 100-240VAC 50/60Hz.

For safety reasons, Apple cannot recommend using a system with no ground. The equipment might work, but would not be safe to use. If a short were to occur, you would be keeping a circuit breaker from stopping the short by not using a ground.

## MacLAN Connect: How to Install It

Revised: 10/18/91  
Security: Everyone

MacLAN Connect: How to Install It

=====

Article Created: 17 September 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Some users need to fuse Macintosh networks to OS/2 nets with Token Ring as unifying backbone. Primarily, Macintosh users create documents that need to be stored on the OS/2 servers and accessed from OS/2 workstations. To a lesser extent, the OS/2 stations share documents with Macintosh users.

DISCUSSION -----

MacLAN Connect from Miramar Systems is a solution. MacLAN Connect enables any PC/XT/AT/386 or compatible to function as an AppleShare-compatible server. All hard disks, LAN volumes, or other storage devices are available to AppleShare-connected Macintosh workstations.

MacLAN Connect is AppleShare Phase 2 compliant. It supports EtherTalk, TokenTalk, Internet Routers, and so on. AppleTalk Filing Protocol (AFP) Version 1.1 specifications are fully supported.

Basically, MacLAN turns a DOS system into an AFP server (which appears to Macintosh systems as any other AppleShare server). In addition, if you log on to PC server volumes before running MacLAN, these volumes can be mounted as logical volumes on the MacLAN AFP servers. Therefore, PC LAN volumes and OS/2 volumes can mount on the Macintosh desktop as AFP volumes.

Although, the process of installation is complex, once installed, it works well. Here's an installation process that worked for one site:

Basic Network

-----  
Our basic network setup looks like this:

--Macs on PhoneNet-----

|                               |            |          |
|-------------------------------|------------|----------|
|                               |            |          |

| running router                | LAN Server | MacLAN   |
|                               |            |          |
| -----MAU-----                 |            |          |
| (these are on 4Mb Token Ring) |            |          |

## Necessary Software

-----

On the Model 50, you must install the IBM token-ring drivers, Apple token-ring drivers, and the DOS LAN Requester software. DLR is a separate software package that comes with LAN Server. You must install it on a workstation before the station can log on to the server. You also need the PC LAN Support disk to determine the address settings on the IBM Token Ring card. In short, you need:

- DXMAID disk from IBM for IBM Token Ring drivers.
- MacLAN Connect, for the AFP server software and the Apple drivers.  
Note: In several places in the documentation, you are told to use AppleShare PC as the source of the Apple drivers. This works if you only want to mount the MacLAN CPU's hard disk as an AFP server. This will not work if you want to attach PC LAN or OS/2 volumes as logical volumes, because the ASPC drivers trash the LAN Requester process. In addition, ANET is installed in the AUTOEXEC file by the ASPC installation, and this causes problems. If you follow the documentation here, it won't work.

Instead, use the drivers supplied with the MacLAN package. They're based on the ASPC drivers. The TOKEN.COM file has been altered to permit the IBM code and Apple code to coexist better.

- IBM Support disk, to check addresses on Token Ring card.
- DOS LAN Requester installation disks (2 disk set)
- Because you want to see the PC server volume on your Macintosh desktop, you'll need to be a user on the PC server. Before beginning this installation, have the system administrator make you a user on the PC server volume. (Under OS/2, this need not mean an entire hard disk; you can designate individual directories as volumes. For our purposes, we designated one directory called COMMON as a shared volume on the OS/2 server.)

## Installation Process

-----

Here is the installation process:

- 1) Install the IBM Token Ring drivers with DXMAID. Check the Config.sys file. It should include:

```
Files=100
Buffers=50
DEVICE=DXMAOMOD.SYS 001
DEVICE=DXMCOMOD.SYS
DEVICE=DXMTOMOD.SYS
```

Adjust the files and buffers if your values don't match these. (Note: There is a complete CONFIG.SYS later in this article.)

- 2) Use the IBM Support Disk to find the ROM and Shared RAM address for the installed Token Ring card.

Typical addresses are:

```
ROM: DE000
Shared RAM: D8000
```

These addresses are very important -- you must edit your NET.CFG file later to adjust the MEM 1 and MEM 2 parameters to match these addresses. (If you've ever installed ASPC with Token Ring drivers, you get two screens asking you to set the "primary" and "secondary" memory addresses -- that's what these values are.)

- 3) Install the DOS LAN Requester software from the IBM disks included with OS/2 LAN Server.

During this process, a directory called DOSLAN is created, and it stores the LAN Requester files as they are unpacked. (Later these files are invoked by commands like "net start" to kick off the network link and "net logon user1" to log on to the server as user1.)

- 4) Create a directory on the DOS system called MACLAN.
- 5) Copy the file MACLAN.EXE from MacLAN Disk 1 to the directory and execute it. The file unpacks into the MacLAN executables, including MLCONFIG and MLSERVE.
- 6) From MacLAN Disk 2, execute the INSTALL.BAT file to install Apple drivers. This creates a DRIVERS directory that contains the appropriate code.

These files look like the usual ASPC code. After installation, check the AUTOEXEC file, and you'll see the familiar code for the ASPC driver installation. However, according to the MacLAN author, some of the files have been altered, so they can work with LAN Requester.

- 7) Use a convenient editor to edit the NET.CFG file in the DRIVERS directory. This file will look like this:

```
Link Support
  Buffers 11 640
  MemPool 16K
```

```
Protocol AppleTalk
DEFAULT TOKEN$ #1
AARP TOKEN$ #1 H(0002) L(6) B(C00040000000)

Link Driver TOKEN$
# IBM Token-Ring Network Adapter/A (MicroChannel)
INT #1 2
MEM #1 DE000 0200
MEM #2 D8000 0400
PORT #1 A20 8
PORT #2 2F0 8
PS/2 Slot?
Protocol AppleTalk AA080007809B
Protocol AARP AA00000080F3
```

8) Here are the important pieces:

- Change Buffers and Mempool to these figures.
- INT specifies the interrupt for the card. 2 is OK for Mod 50.
- Remember those ROM and RAM addresses from the IBM Support disk? Set MEM 1 to the ROM address for the Token Ring card. Set MEM 2 to the shared RAM address for the card.

9) Do a warm reboot with Ctrl-Alt-Del. You should see messages indicating that the IBM drivers are loading, followed by the Apple drivers loading.

10) Run DOS LAN Requester and log on to the PC server. This establishes a logical connection between the MacLAN DOS CPU and the remote server volume. In this case, you have designated a directory called COMMON on the OS/2 server as logical volume X. Once you establish the connection, you can log on to the X volume and directory as usual.

11) Run MLCONFIG. This is the MacLAN configuration program, similar to AppleShare Admin program. You set up Macintosh users and groups as usual. The key piece is that you specify the volumes (including the logical attached volumes) that you want to appear as AFP volumes to Macintosh users. To specify the local Mod50 hard drive as an AFP volume, you specify the C drive. In this case, to specify the OS/2 directory that is mounted as the logical X drive, we specified the X drive and the C drive.

This is a nice feature; each volume can be assigned a volume password, in addition to the generic server password. Many people need the additional layer of security.

12) Run MLSERVE. (Be sure to run this from the MacLAN directory, or it can't find the files that it needs.) This kicks off the AFP server process.

When the AFP server is mounted, Macintosh systems on the LAN can see the MacLAN server from the Chooser. After logging onto the server, in

our case the C drive and the logical X drive that we had mounted (which is actually a directory on the OS/2 server) appear in the Chooser volume list. After users log onto these volumes in the usual Macintosh way, the volumes mount on the desktop and you're all set.

You can set up an AUTOEXEC file that automates this, but you'll have to do it manually the first time to set up MLCONFIG files.

Recommendation: MacLAN Connect is a bit harder than the typical Macintosh application to set up and configure, but once it's up and running, it's a seamless solution to this problem. The only real problems are on the OS/2 administrator's side, where they have to administer privileges, and the like, on their server. OS/2 is very much like UNIX in one way: it's very powerful, with lots of features and matching complexity.

#### The CONFIG.SYS File

-----  
This is final version of our CONFIG.SYS file. We adjusted Buffers and Files to MacLAN's recommended values.

```
DEVICE=C:\DOS\DXMA0MOD.SYS
DEVICE=C:\DOS\DXMC0MOD.SYS
DEVICE=C:\DOS\DXMT0MOD.SYS
SHELL=C:\DOS\COMMAND.COM /E:2000 /P
BUFFERS=60
FILES=100
FCBS=16,8
LASTDRIVE=Z
BREAK=ON
```

#### The NET.CFG File

-----  
This is final version of NET.CFG file in DRIVERS directory created by MacLAN driver installation. Adjust the Buffers and MemPool settings, if necessary. The crucial changes to make are in Link Driver TOKEN\$. Change MEM#1 to match the ROM addresses of your Token Ring card and MEM #2 to match the shared RAM address of your card. You can find these by running the IBM Support disk for your system.

#### Link Support

```
Buffers 11 640
MemPool 16K
```

#### Protocol AppleTalk

```
DEFAULT TOKEN$ #1
AARP TOKEN$ #1 H(0002) L(6) B(C00040000000)
```

## Macintosh 21 Color Display: Automatic Degaussing Feature 10/91

Revised: 5/25/94  
Security: Everyone

Macintosh 21" Color Display: Automatic Degaussing Feature 10/91

=====

Article Created: 1 October 1991

TOPIC -----

This article explains the circuitry in the Macintosh 21-inch Color Display that compensates for magnetic field image distortion.

DISCUSSION -----

The circuitry in the Macintosh 21-inch Color Display provides what is called automatic degaussing to ensure a good image on the screen. Color displays use magnetic fields to guide electron beams inside the CRT to the screen. An external magnetic field close to the CRT can disturb the internal magnetic field, misdirect the beams, and distort the screen image.

Circuitry in most monitors adjusts the internal magnetic field to counteract the external magnetic field, but only at startup. If the external magnetic field changes during operation, a distorted image remains until the power cycles off and on. The AppleColor High-Resolution RGB Monitor has a manual degauss control button that you can press rather than turning off the monitor.

The Macintosh 21-inch Color Display has startup, manual, and automatic degaussing features. It contains an auto-degaussing circuit, called a magnetometer, that measures magnetic fields. The magnetometer sends a signal that initiates a degauss when it senses a major change in the ambient magnetic field. The magnetometer operates constantly while power is on, and degaussing can occur even when no image is on the screen.

Tilting or swiveling the monitor may change the magnetic field enough to cause distortion, and trigger automatic degaussing. Occasional automatic degaussing is normal. If degaussing occurs when you haven't moved the monitor, a source of interference may be in the room. You may have to move the source of interference to reduce the frequency of automatic degaussing. Frequent auto-degaussing can be annoying because it causes the screen to continually blink.

Macintosh 21" Color Display: Ergonomic Features

=====

Article Created: 1 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

This article lists the ergonomic features of the Macintosh 21-inch Color Display.

DISCUSSION -----

Important ergonomic features include:

- The antiglare, antistatic panel reduces glare and dust build-up.
- The built-in tilt and swivel base allows you to change the viewing angle.
- A 75 hertz screen refresh rate eliminates screen flickering.
- The ADB ports are easy to access on the front of the base.
- The brightness and contrast controls are also easily accessed on the front of the monitor.
- The following features minimize the desk space needed for the monitor:
  - Curved and recessed base
  - Recessed video cable connector
  - Right-angled power cord
- The hard plastic spheres on the bottom of the base make it easier to lift and slide the monitor.

## Macintosh 21 Color Display: Shadow Mask (10/91)

Revised: 5/25/94  
Security: Everyone

Macintosh 21" Color Display: Shadow Mask (10/91)

=====

Article Created: 1 October 1991

TOPIC -----

This article explains the function of the shadow mask used in the Macintosh 21-inch Color Display.

DISCUSSION -----

The Macintosh 21-inch Color Display uses a perforated shield called a shadow mask to separate the red, green, and blue electron beams that create the displayed images. Electron beams pass through a mask to strike the designated red, green, or blue dots of phosphor on the back of the screen. These beams cause the colored phosphor dots to glow. The combination of glowing dots produces the color images.

A metal mask or shield commonly used is a vertically-oriented aperture grill design. Traditional mask designs use perforations arranged in a pattern that interacts with the changing pattern of the electron beams as they scan across the shield. The interaction of these patterns frequently causes a screen interference called a moire pattern. The interference is more obvious with certain Macintosh desktop patterns.

The Macintosh 21-inch Color Display uses a pattern of tiny holes in the shadow mask that avoids the distracting effects of the most common moire patterns. This design is an asymmetric dot pitch of .026 mm horizontally and .029 mm vertically. Dot pitch is the distance between two adjacent RGB dot triads. To achieve a high resolution, dot pitch should be as small as possible. This pattern doesn't conflict with the pattern created by electron beams.

Macintosh 21" Color Display: Video Card Support

=====

Article Created: 1 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

What video cards support the Macintosh 21-inch Color Display?

DISCUSSION -----

The same video cards that support the Apple Two-Page Monochrome Monitor support the Macintosh 21-inch Color Display. Cards supporting the 21-inch Color Display include:

- Macintosh Display Card 4•8 at 4 bits per pixel
- Macintosh Display Card 8•24 at 8 bits per pixel
- Macintosh Display Card 8•24 GC at 8 bits per pixel

Here is a table of Macintosh computers and their requirements for use with the Macintosh 21-inch Color Display:

| Macintosh  | Requirements to Use 21-Inch Color Display |
|------------|-------------------------------------------|
| -----      | -----                                     |
| LC         | Third-party video card                    |
| IIIsi      | Video card (note 1)                       |
| IIci       | Video card (note 1)                       |
| IIIfx      | Video card (note 1)                       |
| Quadra 700 | 16 colors built in (notes 1,2)            |
| Quadra 900 | 256 colors built in (note 2)              |

Notes (1): Add a third-party video card for 16.7 million colors.  
(2): Add VRAM to the logic board for 32,000 colors.

## Macintosh 21 Color Display: Adjustable Color Temp (10/91)

Revised: 5/25/94  
Security: Everyone

Macintosh 21" Color Display: Adjustable Color Temp (10/91)

=====

Article Created: 1 October 1991

TOPIC -----

This article explains the adjustable white point color temperature feature of the Macintosh 21-inch Color Display.

DISCUSSION -----

The white point color temperature is a measure, in degrees Kelvin, of how white a display's white is. Traditional displays use a 9300 degree K white, which has a bluish tint to it and a high contrast. A 6500 degree Kelvin white is similar to page white and is more useful for color matching.

This feature is important to graphics professionals, although other users will appreciate having the choice. With it, users can more closely match the color of an object designed on a computer with how it looks when printed by a commercial printer. The page-white gamma table provides 6500 degrees K white point, which matches the color of white paper. This improves WYSIWYG in graphic design, since the white backgrounds of the monitor and paper are the same.

The Macintosh 21-inch Color Display allows adjustment of the white point color temperature. To make an adjustment, follow these steps:

- 1) Select the monitor CDEV in the Control Panel. (In System 7, open the Monitors control panel.)
- 2) Hold down the Option key and click on the Option button.
- 3) The options dialog offers a choice of gamma tables. Choose:
  - the Mac Std Gamma option for 9300 degree K,
  - the Page-White Gamma option for 6500 degree K white, or
  - uncorrected gamma.

Apple ISDN NB Card: Description (Discontinued)

=====

Article Created: 25 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

This article describes the Apple ISDN NB Card, a discontinued product.

DISCUSSION -----

The Apple ISDN NB Card provides Macintosh II computers with basic rate connectivity to the Integrated Services Digital Network (ISDN). When used with the Apple ISDN software it provides access to a wide variety of services such as centralized document, image, and video database applications; integrated screen-based telephony and office automation applications; and high-speed file transfer.

The Apple ISDN NB Card is an intelligent NuBus card with a 68000 microprocessor, 512K of RAM, and a multitasking operating system. Because of its independent processor, the Apple ISDN NB Card executes communications protocols with minimal access to the Macintosh II CPU. The Apple ISDN NB card implements the CCITT ISDN basic rate interface (2B+D) and supports a standard analog DTMF (dual-tone multifrequency) telephone. Used with the Apple ISDN software, the Apple ISDN NB card is compatible with the AT&T 5ESS and Northern Telecom DMS-100 ISDN switches.

The Apple ISDN NB Card and software support simultaneous voice and data circuit-switched connections. The Apple ISDN NB Card provides direct access to 64/56 Kbps for synchronous connections and supports the CCITT V.110 and V.120 rate adaption protocols for asynchronous connections.

The Apple ISDN NB Card and software are supported by the Macintosh Communications Toolbox, a high-level applications programming interface (API). The Communications Toolbox supports the new Telephone Manager, Apple ISDN Telephone Tool, and Apple ISDN Serial Tool. The Telephone Manager and ISDN tools provide access to a core set of telephone and data

functions for developing and implementing integrated voice and data applications on the Macintosh.

Apple ISDN NB Card Features:

- Simultaneous circuit-switched voice and data connection capabilities
- Software-selectable ISDN switch type and configuration
  - AT&T 5ESS
  - Northern Telecom DMS-100
- ISDN basic rate S-interface (RJ-45)
- Voice call control from a standard analog telephone attached to the Apple ISDN NB Card (RJ-11)
- Works on any Macintosh II computer running System 7
- V.120 and V.110 rate adaption support
- Macintosh Communications Toolbox support
  - Telephone Manager
  - Apple ISDN Telephone Tool
  - Apple ISDN Serial Tool
- External power sources
  - Apple ISDN Power Supply
  - Power source 2 (PS2)

Apple ISDN NB Card: Specifications (Discontinued)

=====  
Article Created: 25 October 1991  
Article Reviewed/Updated: 22 August 1994

TOPIC -----

This article gives technical specifications for the Apple ISDN NB Card.

DISCUSSION -----

### Hardware

- 
- NuBus card based on the Macintosh Coprocessor Platform
  - 68000 processor with 512K of RAM
  - RJ-45 connector for basic rate (2B+D) four-wire S-interface according to CCITT 1.430 specification
  - RJ-11 connector for support of standard DTMF telephone
  - Connector for external power supply
  - Built-in support for PS2 circuit power at the ISDN S-reference point

### Software

- 
- Compatibility with the AT&T 5ESS and Northern Telecom DMS-100 ISDN switches
  - V.110 rate adaption data speeds supported: 600, 1200, 2400, 3600, 4800, 7200, 9600, 14400, and 19200 bps
  - V.120 rate adaption data speeds supported: determined by the remote computer's terminal adapter, which also must use the V.120 protocol

### System Requirements

- 
- A Macintosh II computer running System 7. (The Macintosh IIsi requires a NuBus adapter.)
  - Basic rate interface lines that support one of the following ISDN basic rate lines or equivalent:
    - AT&T 5ESS
    - Northern Telecom DMS-100
    - An emulator or PBX that is compatible with one of the above switches
  - A basic analog telephone with DTMF dialing.
  - A telephone cord to connect your telephone to the RJ-11 connector on the ISDN NB Card.
  - Network terminating resistor. (It is recommended that a terminating resistor be used if there is more than 33 feet of cable between the network termination point [NT1] and the Apple ISDN NB Card.)

Note: The Apple ISDN NB Card is NOT ISDN-1 compliant.

#### Article Change History

-----

22 Aug 1994 - This product is discontinued.  
28 Oct 1992 - Revised to clarify the availability of this card.

## MacTCP: Description (6/95)

Revised: 6/16/95  
Security: Everyone

MacTCP: Description (6/95)

Article Created: 25 October 1991  
Article Reviewed/Updated: 15 June 1995

TOPIC -----

This article describes MacTCP software.

DISCUSSION -----

For information on the current version of MacTCP, see the Tech Info Library articles, "TCP/IP Connection for Macintosh 2.0.4" and "MacTCP 2.0.4 to 2.0.6 Patch: Read Me, Release Notes."

With MacTCP software, developers can create Apple Macintosh applications for network environments that use the Transmission Control Protocol/Internet Protocol (TCP/IP) protocol suite.

TCP/IP is a set of standards widely used for networking heterogeneous systems. MacTCP implements the User Datagram Protocol (UDP), TCP, and IP protocols, and conforms to Internet RFCs and MIL-STDs. This conformity ensures interoperability with systems on the TCP/IP Internet.

MacTCP is co-resident with the AppleTalk protocols and runs over both Ethernet- and LocalTalk-compatible cable systems. You can install it on a Macintosh Plus or later model Macintosh computer. It is compatible with System Software version 6.0.5 (or later) or version 7.x.

### Features

- TCP/IP protocol driver implementation
- Compatible with Macintosh Plus or later model Macintosh computers
- Concurrent TCP/IP and AppleTalk operation
- Both C and assembly-language interfaces

- Address configuration using the Control Panel interface
- Apple-supported driver

#### Benefits

-----

- Provides a standard platform for developing TCP/IP applications and solutions.
- Supports multiple concurrent TCP/IP services.
- Lets third-party developers create applications that can run on a range of Macintosh computers.
- Preserves full access to AppleTalk services. For example, users can run MacTCP while printing to an Apple LaserWriter printer over LocalTalk cable.
- Provides developers with a familiar development environment.
- Simplifies installation and setup procedures for users and network administrators.

#### Article Change History:

- 15 Jun 1995 - Added information on new versions of MacTCP.
- 25 May 1995 - Corrected information about System 6.0.5.

## MacTCP 1.x: System Requirements and Product Details (11/94)

Revised: 11/30/94  
Security: Everyone

MacTCP 1.x: System Requirements and Product Details (11/94)

=====

Article Created: 25 October 1991  
Article Reviewed/Updated: 30 November 1994

TOPIC -----

This article gives the system requirements for using MacTCP, and details about what MacTCP offers.

DISCUSSION -----

### System Requirements

-----

- for LocalTalk-compatible systems
  - A Macintosh Plus or later model Macintosh computer
  - System software version 6.0.5 or later and at least 1MB of memory, or system software version 7.0 and at least 2MB of memory
  - Appropriate LocalTalk-compatible cable connectors
  - A router with AppleTalk and TCP/IP support, such as the Shiva Corporation FastPath 5 or the Cayman Systems GatorBox CS
- for Ethernet-compatible systems
  - A Macintosh Plus or later model Macintosh computer
  - System software version 6.0.5 or later and at least 1MB of memory, or system software version 7.0 and at least 2MB of memory
  - An appropriate Ethernet interface card such as the Apple Ethernet NB Card

### Product Details

-----

MacTCP consists of object code libraries and associated files for both C and assembly-language development. Libraries include TCP and UDP interfaces along with a name-to-address resolver. A programmer's reference guide and an administrator's guide are provided.

The MacTCP driver allows for the addition of other data link layers through the use of a link layer interface between the IP layer and the data link layer of MacTCP. Examples of these data link layers include Token Ring (IEEE 802.5), Serial Line Internet Protocol (SLIP) -- RFC 1055, and Point-to-Point Protocol (PPP) -- RFCs 1171 and 1172. The link layer interface is described in the reference document Building Alternate Link Access Protocol Modules for MacTCP, available to Apple Partners and Apple Associates through the Developer CD Series.

#### Protocols

-----

MacTCP implements the following protocols:

- IP (RFCs 791, 894; MIL-STD 1777)
- UDP (RFC 768)
- TCP (RFC 793, MIL-STD 1778)
- ARP (RFC 826)
- RARP (RFC 903)
- ICMP (RFC 792)
- BootP (RFCs 951, 1048)
- RIP (IDEA004)
- DNS (RFCs 1034, 1035)
- Internet Subnetting (RFC 950)
- Internet Assigned Numbers (RFC 1010)

MacTCP complies with Requirements for Internet Hosts-Communication Layers (RFC 1122)

Throughput is 3.0 megabits per second memory-to-memory (on a Macintosh II-family computer over Ethernet).

## MacX25: Description

Revised: 11/1/91  
Security: Everyone

MacX25: Description

=====

Article Created: 25 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

This article describes MacX25 software.

DISCUSSION -----

MacX25 software links Apple Macintosh personal computers to packet-switched data networks (PSDN) supporting CCITT Recommendation X.25.

MacX25 server software allows you to set up a Macintosh as a single entry point to the PSDN. Access to host computers and end-user services on the PSDN is distributed from the server to Macintosh computers over the AppleTalk network system.

MacPAD software, included with MacX25, works in conjunction with the server software and provides packet assembler/disassembler (PAD) connectivity to the PSDN. MacPad is implemented as a connection tool for the Macintosh Communications Toolbox, and it allows terminal applications using the toolbox to connect to host systems on the PSDN.

MacX25 features an administrator's application that facilitates configuration and administration of the server. An address service allows administrators to set addressing details on the Macintosh server, presenting MacPAD users with a menu that lists available hosts and end-user services by name. Users connect to services simply by selecting the appropriate name -- they aren't required to know PAD commands and address numbers.

The MacX25 Programming Library (available separately) works in conjunction with the MacX25 server to provide X.25 access to applications, enabling developers to create Macintosh solutions that give users access to packet-

switched networks.

## Features

-----

- X.25 network access
- Conformance to International Telegraph & Telephone Consultative Committee (CCITT) recommendations
- Support for System software versions 6.0.7 and 7.0
- Server-based access
- Packet assembler/disassembler facility (MacPAD)
- Transfer of 8-bit characters using MacPAD
- Easy-to-use Address Book with a graphics-based user interface
- Graphics-based Administrator application
- User passwords

## Benefits

-----

- Provides Macintosh computer users with reliable wide area network connectivity.
- Provides universal interoperability with other X.25-conformant systems.
- Makes it easy to migrate from version 6 to version 7.
- Makes it easy to add and administer users.
- Reduces costs by maximizing use of expensive resources such as leased lines.
- Supports asynchronous terminal access to packet-switched networks.
- Allows use of MacX25 on international sites with European languages.
- Allows users to select an available service by name without having to learn traditional PAD commands.
- Facilitates software installation and administration of user access.
- Prevents unauthorized users from accessing the server.

MacX25: System Requirements and Product Details

=====

Article Created: 25 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

This article gives the system requirements for using MacX25 as well as details about what MacX25 offers.

DISCUSSION -----

### System Requirements

#### - MacX25 Server

To set up a MacX25 server, you need:

- Any modular Macintosh computer with an internal hard disk and at least 2MB of memory for System software version 6.0.7 (4MB of memory for version 7.0)
- Macintosh System software version 6.0.7 (or later) or version 7.0
- An Apple Serial NB Card with the appropriate RS-232-C or V.35 cable
- The appropriate cable connectors

To use MacX25 on an Ethernet or a token ring network, you need the appropriate interface card for your Macintosh.

#### - MacPAD

To use MacPad, you need:

- A Macintosh Plus computer or later model with at least 1MB of memory

for System software version 6.0.7 (2MB of memory for version 7.0)

- A terminal-service application that uses the Macintosh Communications Toolbox
- The appropriate cable connectors

To use MacPAD on an Ethernet or a token ring network, you need the appropriate interface card for your Macintosh.

## Product Details

-----

### - General Features

MacX25 supports:

- CCITT 1980 Compatible Mode
- CCITT 1984 Compatible Mode
- Packet Assembler/Disassembler (X.3, X.28, and X.29)
- Operation as a DTE
- Operation as a DCE
- Virtual Circuits: 64 maximum
- A single link for each Apple Serial NB Card
- Multiple cards for each modular Macintosh
- Operation at up to 19.2 Kbps with RS-232-C
- Operation at up to 64 Kbps with V.35
- Multiple servers for each AppleTalk network system

MacX25 doesn't support:

- Permanent Virtual Circuits
- X.32 switched circuit operation

### - Network Certification

MacX25 is certified for connection to Telenet, GEIS (GEISCO), and Tymnet networks; and in Europe, for Austria (DATEX-P), France (Transpac), Germany (DATEX-P), Italy (ITAPAC), the Netherlands (Datanet-1), Norway (DATAPAK), Sweden (DATAPAK), and Hong Kong (DATAPAK).

In addition, MacX25 can be used to connect to the public PSDN in Australia (Austpac), Canada (Datapac), Denmark (DATAPAK), and Switzerland (Telepac).

### - MacX25 Programming Library

The MacX25 Programming Library allows developers to create software solutions that provide users with access to a packet-switched data network. It works in conjunction with the MacX25 server to provide X.25 services to application programs.

The library is a toolkit, or collection of C language routines, that offers a high-level program interface for applications. Routines are

included for initiating and terminating contact with the MacX25 server, establishing and closing down a virtual circuit, passing data across an established circuit, and more. Technical support is available to Apple Partners and Associates.

## PowerBook Fax/Data Modem and AppleFax

Revised: 11/1/91  
Security: Everyone

PowerBook Fax/Data Modem and AppleFax

=====  
Article Created: 22 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Will the new Macintosh PowerBook Fax/Data Modem support data communication and file transfer with the AppleFax Modem? If it does, at what baud rate?

DISCUSSION -----

The Macintosh PowerBook Fax/Data Modem will not communicate with the old AppleFax Modem in standard data communication mode. The Macintosh PowerBook Fax/Data Modem is capable of sending facsimiles to the AppleFax Modem.

Page 92 of the "AppleFax Modem User's Guide" states the following:

"If you want, you can use a communications application as long as you're communicating with another AppleFax Modem. A communications application lets you transmit Macintosh files, type messages back and forth, and use the modem commands described in Appendix B."

The manual goes on to say (on page 92) what communications parameters the AppleFax Modem requires to successfully use a 9600-baud modem.

This means that the AppleFax Modem will allow you to transmit Macintosh files (text files, MacPaint files, PICT files, and so on) to another Macintosh at 9600 baud as long as both modems are AppleFax modems. It isn't necessary for both AppleFax Modems to use the same communication software as long as they support the same transfer protocol.

The AppleFax Modem does support a subset of the Hayes "AT" command set. For more information on this, look in Appendix B, which starts on page 137.

## LaserWriter IIg: AppleTalk Phase 2 on EtherTalk Network

Revised: 11/1/91  
Security: Everyone

LaserWriter IIg: AppleTalk Phase 2 on EtherTalk Network

=====

Article Created: 24 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

When an Apple LaserWriter IIg is connected to an EtherTalk network, is it an AppleTalk Phase 2 or AppleTalk Phase 1 node? I suspect that it is an AppleTalk Phase 2 node. Does this mean that it won't work on an AppleTalk Phase 1 EtherTalk network? Can it be changed to AppleTalk Phase 1 somehow?

DISCUSSION -----

The Apple LaserWriter IIg, when connected to an EtherTalk network, is an AppleTalk Phase 2 device only. There is no way to make it an AppleTalk Phase 1 device on an EtherTalk network.

To get the Apple LaserWriter IIg to work on an AppleTalk Phase 1 EtherTalk network, you need to set up an AppleTalk Phase 1/AppleTalk Phase 2 transition router on the EtherTalk network.

## Quadra 900: Support for 8-Bit Sound

Revised: 8/6/92  
Security: Everyone

Quadra 900: Support for 8-Bit Sound

=====  
Article Created: 21 October 1991  
Article Last Reviewed: 5 August 1992  
Article Last Updated:

TOPIC -----

Does the Quadra 900 support 16-bit sound?

DISCUSSION -----

No. The Macintosh Quadra 900 supports 8-bit sound.

Sound in overview:

- Quadra 900 and 700 microphone inputs are monophonic.
- Quadra 900 external sound input takes in stereo sound and turns it into a single audio signal before recording by combining the two channels.
- Both Quadra models play stereo samples through Batman (an updated version of the Apple Sound Chip) if you have stereo samples from a third party. Otherwise everything comes out monophonic.

Note one exception: If you have an internal CD-ROM, stereo tracks "Play through" to the headphone output in stereo. If you record from an internal CD, it will be monophonic.

AppleShare 3.0: Setting Up a Temporary Account

=====

Article Created: 21 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

How can I set up a user (name and password) for temporary use?

DISCUSSION -----

- 1) In the Server Preferences dialog box, set the number of days until the password expires.
- 2) Change the user's privileges so that he or she can't change the password.

The only drawback is that it forces all server clients to change their passwords. The added security may be worth it.

## AppleShare Drop Box: Access for System 6 and 7 Clients

Revised: 11/1/91  
Security: Everyone

AppleShare Drop Box: Access for System 6 and 7 Clients

=====

Article Created: 21 October 1991

### Article Change History

-----

08/19/92 - REVIEWED

- For technical accuracy; edited.

### TOPIC -----

If a System 7 user creates a drop box on an AppleShare server, a 6.0 user can't see it. Is there a fix?

### DISCUSSION -----

A System 7 user would not be able to see this folder either. The drop folder was created in an area where the user doesn't have access privileges. You must create a drop folder within a folder that the user can access. The folder itself cannot be the share point. Since a user can't "See Folders" on a drop folder, it makes sense that they would be unable to mount that folder as a share point.

Create a folder named "Drop Folders" with all privileges except "Make changes." Within that folder make your drop folder. That should solve the problem.

## System 7: Opening System File 6.0.X from System 7

Revised: 9/11/92  
Security: Everyone

System 7: Opening System File 6.0.X from System 7

=====

Article Created: 18 October 1991

### Article Change History

-----

09/11/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

From my Macintosh running System 7, I opened a version 6.0.X System file to get a list of fonts, DAs, and sounds installed in that System file. With that window open, if I choose Page Setup or Print Window from the File menu, garbage is displayed on the right side of the menu bar in the Balloon Help and Application areas.

### DISCUSSION -----

Although you can open a version 6.0.X System file under System 7 to get a list of fonts, DAs, or sounds installed, don't choose Print Window or Page Setup for that window. When you open the System file on the version 6.0.X disk, System 7 tries to use the System resources from the version 6.0.X file -- the most recently opened resource file -- which causes unpredictable results, including displaying garbage in the menu bar.

LaserWriter IIif & IIg: PhotoGrade, FinePrint & Microfine Toner

=====

Article Created: 7 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

- 1) Do the LaserWriter IIif and IIg use microfine toner?
- 2) Is FinePrint different from H-P's RET?
- 3) How does PhotoGrade compare to RET and microfine toner?

DISCUSSION -----

- 1) The LaserWriter IIif and IIg don't use microfine toner, because they get excellent results using the same size toner as before.
- 2) While they function differently, FinePrint and RET are both designed to improve the quality of text and lines without affecting performance.
- 3) PhotoGrade is completely different from RET or microfine toner. RET smooths text and lines. It doesn't improve images. Microfine toner doesn't improve the resolution of images; it just has smaller average toner particles. Since a single 300-dpi dot uses a number of particles, smaller toner has minimal impact on print quality.

## Macintosh 21 Color Display: Not Designed for PCs, UNIX 8/92

Revised: 5/25/94  
Security: Everyone

Macintosh 21" Color Display: Not Designed for PCs, UNIX 8/92

Article Created: 7 October 1991  
Article Reviewed/Updated: 31 August 1992

TOPIC -----

Can the Macintosh 21-Inch Color Display work with PC compatibles or UNIX workstations?

DISCUSSION -----

No. This display is designed and optimized to work only with the Macintosh. Apple designed the Macintosh hardware and software to take advantage of large screen size, multiple monitors, and millions of colors.

Windows and UNIX workstation displays offer pixel areas of 1024 x 768. This provides fewer than a million pixels, which won't display two full pages. The Macintosh 21-inch Color Display provides over a million pixels and offers 27% more viewing area than these displays.

The Macintosh graphics architecture is based on software, while the others (VGA, XGA, UNIX) are based on hardware specifications. This means that the Macintosh takes advantage of many different screen resolutions, while XGA is limited to 640 x 480 or 1024 x 768. The Macintosh architecture supports 24-bit color and multiple monitor configurations. The flexibility of the Macintosh software architecture makes 24-bit color, graphics acceleration, and pivoting displays available on the Macintosh platform.

LaserWriter IIf & IIg: How FinePrint and TrueType Enhance Output

=====

Article Created: 7 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

- 1) Does FinePrint enhance text only, or graphics too?
- 2) What is the difference between TrueType and FinePrint?
- 3) Do the LaserWriter IIf and IIg sense differences between text and images?

DISCUSSION -----

- 1) FinePrint smooths all black and white objects including:
  - Text
  - Line graphics
  - Line-art scan
- 2) TrueType (or any outline font technology) scales text to look good at the printer resolution. FinePrint takes that high-quality 300-dpi text, and improves the quality further by eliminating the 300-dpi jaggies.
- 3) The printer differentiates between text and images, so that FinePrint smoothing is not performed on images. Smoothing images actually degrades the quality so it is critical to differentiate between these data types.

LaserWriter IIf and IIg: No Automatic Emulation Switching

=====

Article Created: 7 October 1991  
Article Last Reviewed: 17 June 1992  
Article Last Updated: 17 June 1992

TOPIC -----

Does the LaserWriter IIf have auto-sensing for print emulation? The QMS 410 automatically senses HP PCL emulation, and switches the printer into HP PCL emulation mode following a Postscript print job. Does the LaserWriter IIf do this as well?

DISCUSSION -----

The LaserWriter IIf and IIg do NOT automatically sense, and change, emulation modes. The QMS 410 provides auto-sensing for print emulation. In other words, when you send it a print job, it determines what kind of job it is and switched the printer into that mode. If you send it a PostScript job it switches into PostScript mode. If you send it an HP PCL job it switches into that mode.

The LaserWriter IIf and IIg do not do this. You set their ports up ahead of time and whatever they are set up for it what they will accept. The trick thing the LaserWriter IIf and IIg do is let you have more than one connection to the printer (2 for the LaserWriter IIf, 3 for the LaserWriter IIg). Each connection can be a different type of job. The only way to change emulations is via a PostScript program or switch setting.

There is a big difference between auto-sensing and arbitration.

Apple OneScanner: Image Quality and dpi Ratings

=====

Article Created: 9 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

How does the Apple OneScanner's 300 dpi compare to the 600 or 800 dpi claimed by other vendors?

DISCUSSION -----

When other vendors claim 600 dpi or higher, they are usually referring to a combination of hardware (the true resolution of the scanner itself) and software interpolation. The OneScanner's hardware resolution is 300 dpi, which is more than adequate for the majority of common scanning, even for high-end printers such as imagesetters.

As for software interpolation, the Ofoto software allows scaling up to 16,000 dpi, which is much higher than anything commonly used. What matters is the quality of the resulting image, processed by both hardware and software.

Apple OneScanner: Image Editing Software

=====

Article Created: 9 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Why doesn't the Apple OneScanner ship with image editing software, such as Photoshop or ColorStudio, as do most other scanners?

DISCUSSION -----

Image editing software isn't necessary for mainstream scanning. Other vendors require a multitude of image editing tools to adjust a scanned image to match the original, whereas Ofoto software automatically produces an accurate scanned image.

Image editing programs actually complement the OneScanner. Customers can benefit from those programs, but they aren't necessary for the basic purpose of getting an excellent scanned image.

## SNA•ps 3270: Description (Discontinued)

Revised: 7/12/94  
Security: Everyone

SNA•ps 3270: Description (Discontinued)

Article Created: 30 October 1991

TOPIC -----

This article describes SNA•ps 3270 (Systems Network Architecture protocols and services) software.

DISCUSSION -----

SNA•ps 3270 is a 3270 display terminal emulation program that lets Macintosh computers communicate with IBM mainframes. It provides Control Unit Terminal (CUT) and Distributed Function Terminal (DFT) emulation of IBM 3270 Information Display Systems.

This application software works with the Apple Coax/Twinax Card, Apple TokenTalk NB Card, or Apple Serial NB Card installed in any Macintosh II system and supports up to five direct or AppleTalk distributed 3270 sessions. In an AppleTalk network with a SNA•ps Gateway installed, SNA•ps 3270 users can access host services using any Macintosh, including the Macintosh Plus, Macintosh Classic, Macintosh SE and SE/30, Macintosh LC, Macintosh Portable, and any Macintosh II system. You can access multiple gateways for concurrent access to multiple hosts.

It supports file transfer for text, binary, and Macintosh document transfers using the IBM IND\$FILE host software in the MVS/TSO, VM/CMS, and CICS environments. You can use the Clipboard to copy and paste between the Macintosh and mainframe.

### Features

-----

- 3270 terminal emulation for models 2, 3, 4, and 5
- Extended attribute support
- File transfer compatible with the IBM IND\$FILE standard
- NetView network management
- On-line help
- Keyboard remapping

- Configurable on-screen keypads
- Keystroke record and playback
- Support for all Macintosh platforms: compact, portable, and modular
- SNA/DFT sessions distributed over AppleTalk

#### Benefits

- Enables Macintosh users to access 3270-based applications.
- Provides display support for base and extended attributes and status line symbols.
- Allows users to move files between Macintosh and IBM System/370 hosts running MVS/TSO, VM/CMS, or CICS.
- Reports error conditions based on standard NetView alerts.
- Provides convenient help in configuring and running SNA•ps 3270.
- Allows users to create any layout of 3270 control keys on the attached Macintosh keyboard.
- Eliminates the need for the user to memorize the keyboard map.
- Allows definition of a string of frequently used keystrokes for automated host access.
- Provides a single, Apple-labeled 3270 emulation product for all Macintosh personal computers.
- Allows SNA access for Macintosh systems connected to AppleTalk networks.
- Enables background file transfers while running other Macintosh applications.

#### Product Details

##### 3270 Terminal Emulation

SNA•ps supports the following terminal types:

- 3178/3278 models 1, 2, 3, 4, 5, and C3
- 3278/3279 models 2, 3, 4, 5/S2A, S2B, S3A, and S3B
- 3180 model 1
- 3191/3192 Display Station models A, B, C, D, E, F, and L

##### 3270 Display Terminal Functions

It supports base and extended attributes, extended color support, and OIA status line symbols.

##### AppleTalk Gateway

SNA•ps 3270 runs as a client to an SNA•ps Gateway on the user's computer or on another computer connected to the AppleTalk network or internetwork.

##### Special Features

SNA•ps 3270 includes on-line help, keyboard remapping of 3270 control keys, on-screen keypads for easy access to frequently used 3270 keys, and keystroke recording and play-back for automating operations such as file transfers and electronic mail retrieval.

SNA•ps 3270: System Requirements and Product Details

=====

Article Created: 30 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

This article provides product details on the SNA•ps 3270 application software, and system requirements for using SNA•ps 3270.

DISCUSSION -----

System Requirements

-----

To use SNA•ps 3270 for CUT or 5-session DFT, you need:

- A Macintosh II system
- An Apple Coax/Twinax Card, Apple TokenTalk NB Card, or Apple Serial NB Card
- Macintosh system software version 6.0.5 or later

To use SNA•ps 3270 as a client to an SNA•ps Gateway, you need:

- SNA•ps 3270 or SNA•ps 3270 GC
- A Macintosh Plus or later Macintosh system as the client computer
- A Macintosh II system running the SNA•ps Gateway software on your AppleTalk network
- Macintosh system software version 6.0.5 or later

On the IBM host, you must have the following IBM file transfer software:

- 5665-311 (3270-PC File Transfer Program for MVS)
- 5664-281 (3270-PC File Transfer Program for VM/SP)
- 5798-DQH (CICS/VS 3270-PC File Transfer Program)

#### Product Details

-----

- 3270 Terminal Emulation

SNA•ps supports the following terminal types:

- 3178/3278 models 1, 2, 3, 4, 5, and C3
- 3278/3279 models 2, 3, 4, 5/S2A, S2B, S3A, and S3B
- 3180 model 1
- 3191/3192 Display Station models A, B, C, D, E, F, and L
- 3270 Display Terminal Functions

SNA•ps 3270 supports base and extended attributes, extended color support, and OIA status line symbols.

- MultiFinder Compatibility

SNA•ps 3270 stays active in the background under MultiFinder, enabling file transfers to continue while you work with other 3270 sessions or local Macintosh applications.

- AppleTalk Gateway

SNA•ps 3270 runs as a client to a SNA•ps Gateway on the user's computer or on another computer connected to the AppleTalk network or internetwork.

- Special Features

SNA•ps 3270 includes on-line help, keyboard remapping of 3270 control keys, on-screen keypads for easy access to frequently used 3270 keys, and keystroke recording and playback for automating operations such as file transfers and electronic mail retrieval.

## PowerBook Wins Usability Study (7/92)

Revised: 5/17/94  
Security: Everyone

PowerBook Wins Usability Study (7/92)

Article Created: 31 October 1991  
Article Reviewed/Updated: 31 July 1992

TOPIC -----

Apple's new Macintosh PowerBook notebook computers scored highest in a usability study conducted by an independent industrial design firm. The PowerBook models 170 and 100 won over eight competitive notebooks from Compaq, Toshiba, NEC, Sharp, Zenith, IBM, AT&T, and Zeos. The study involved more than 450 tests of design, ergonomics, functionality, portability, and ease of use.

DISCUSSION -----

### A New Approach

Most notebook computer reviews deal with "speeds and feeds," an approach more for technologists than for end users. Apple hired GVO, an independent design company not involved in any of the systems tested, to put the leading notebook computers through a series of real world usability tests, to quantify their designed-in advantages. They performed tests across the whole spectrum of notebook use: from the time the user first opens the box, through extended use in the office and in the field (including use in airplanes and cars).

### The NCAT (Notebook Computer Aptitude Test)

GVO specialists evaluated the machines according to four key criteria:

- Function/Purpose: How well the product fulfills the user's purpose
- Physical Fit: How well the product meets the user's ergonomic needs
- Learning/Understanding: How easy the product is to learn and understand
- Satisfaction: How satisfying the product is to see and to use

The study applied these values to out-of-the-box experience, installation and set-up, mechanics, initial use, long-term use, and use while travelling. In all, they conducted more than 450 individual design and usability tests,

including true size and weight of all necessary components, set-up and tear-down effort for movement, desktop and laptop footprint, briefcase fit, ergonomics, balance, fit & finish, durability, image, power management, screen viewing angle and visibility, typing, GUI navigation, and usability in the office, on an airplane and in a car. They graded individual tests on a scale of 0 to 4 (4 being the best), and averaged the grades to compute a final score, giving all tests equal weight.

#### The Results

-----  
The Macintosh PowerBooks ranked the highest. The overall scores on a scale of 0 to 4 (4 being the best) were:

|                           |      |
|---------------------------|------|
| Macintosh PowerBook 170:  | 3.07 |
| Macintosh PowerBook 100:  | 2.93 |
| AT&T Safari:              | 2.65 |
| Zeos 386SX:               | 2.35 |
| NEC Ultralite 286F:       | 2.29 |
| Toshiba T-2000SX:         | 2.28 |
| Zenith MasterSport 386SX: | 2.22 |
| Compaq 386S/20:           | 2.15 |
| Sharp 6641:               | 2.02 |
| IBM PS/2 L-40:            | 2.00 |

The PowerBook 140 wasn't included in the test due to its similarity to the PowerBook 170.

The DOS-based systems were equipped with Windows 3.0 and a Logitech TrackMan Portable track ball, in order to compare graphical environments.

#### Some Quotes From The Findings

-----  
"The PowerBook 170 and 100 represent the best notebook value available in the market today.

"The PowerBooks are easily the most portable and flexible of the 10 notebooks tested."

"Through a clever integration of engineering, design, and ergonomics, Apple has created the first notebook computers that can actually be used comfortably in someone's lap."

"The combination of small size, low weight, elegant design, integrated trackball, palm rests, active matrix LCD, and software-controlled floppy drive makes the PowerBook 170 the most usable, versatile, and desirable system tested."

#### Putting The Tests In Perspective

-----  
The Ingram benchmark study showed that the PowerBooks deliver faster performance than competitive notebooks running Windows 3.0. The NCAT gives evidence that the PowerBooks are more usable than the competition. And the DRI studies show what that means to users -- they say they are more productive and satisfied than

people who use PC clones running DOS or Windows 3.0.

About GVO

-----

GVO is an independent industrial design firm, located in Palo Alto, California. It was not involved in the design of any of the machines tested. GVO has designed other notebook computers, and is experienced in human engineering, electronics packaging, product planning, and cognitive psychology.

NOTE: If the NCAT results are to be used in a public document, our contract with GVO requires Competitive Analysis to review it first. Please send your drafts to COMPETITION.

## Macintosh Quadra 700 and 900: Recording 44kHz Sound

Revised: 8/6/92  
Security: Everyone

Macintosh Quadra 700 and 900: Recording 44kHz Sound

=====

Article Created: 30 October 1991  
Article Last Reviewed: 5 August 1992  
Article Last Updated:

TOPIC -----

Is it possible to record 16-bit and 44kHz CD quality on a Quadra 700 or 900?

DISCUSSION -----

The Quadra's sound input is 8-bit linear PCM with analog limiting to enhance the power of the signal being digitized. The sample rate may be 22kHz or 11kHz. Therefore, to achieve 44kHz input, you'll need to obtain third-party hardware and software tools, such as those from Digidesigns, Inc. Information on Digidesigns' offerings may be found in buyer's guides, including the electronic buyer's guides on AppleLink.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

## Apple IIGS: Network Slot Assignments

Revised: 1/14/92  
Security: Everyone

Apple IIGS: Network Slot Assignments

=====

Article Created: 9 October 1991  
Article Last Reviewed: 14 January 1992  
Article Last Updated: 14 January 1992

TOPIC -----

You can often trace Apple IIGS network printing difficulties to the setting of slot assignments in the Control Panel.

DISCUSSION -----

Setting Correct Network Slot Assignments

-----

Here are the steps to set the proper network slot assignments:

- 1) Find the Apple IIGS ROM versions in the initial splash screen when you start the computer. The bottom line of that screen contains information noting either 01 or 03 version ROMs.
- 2) Open either the Apple IIGS Control Panel (Open Apple-Control-Escape) or the Graphic Control Panel (under the Apple Menu in the GS/OS menu bar).
- 3) Here are the correct slot settings:
  - For Apple IIGS systems with version 01 ROMs, set Slot 1 to "Your Card" and Slot 7 to "Built-in AppleTalk."
  - For Apple IIGS systems with version 03 ROMs, set Slot 1 or Slot 2 to "AppleTalk" and Slot 7 to "AppleTalk."

ProDOS 8 Applications

-----

Some ProDOS 8 applications require printer slot definition. In such applications, you need to select the appropriate slot within the

application's printer selection routine. For ROM 01 the appropriate slot for network printing will be slot 7. For ROM 03 the appropriate slot for network printing will be slot 1.

Other ProDOS 8 applications insulate the user from the need to select a specific slot. For example AppleWorks 3.0N uses a printer called "ImageWriter (AppleTalk)." The user often still needs to select a printer from within the application. However, these applications indicate that a printer is a network printer.

#### GS/OS Applications

-----

Applications that are GS/OS based (those that display the Graphic Control Panel) use the Control Panel (or the AppleShare Admin startup information) to select their printer. You don't need to set printer slot assignments within the application. They are handled by the operating system from the Control Panel settings (or the AppleShare Admin startup information).

## Macintosh LC: Print, Copy, or Save Apple IIfx Card Screen

Revised: 11/8/91  
Security: Everyone

Macintosh LC: Print, Copy, or Save Apple IIfx Card Screen

=====

Article Created: 9 October 1991  
Article Last Reviewed: 3 June 1992  
Article Last Updated: 3 June 1992

TOPIC -----

How can I dump the screen of the Macintosh LC to an ImageWriter connected to the Modem Port while using the Apple IIfx Card in Apple IIfx mode? Cmd-Shift-4 reportedly doesn't work as it does under the Macintosh operating system.

DISCUSSION -----

Screen Dump to Printer

-----

The following procedure works with version 2.0 of the Apple IIfx Card software:

- 1) After launching the Apple IIfx Startup application, open the Apple IIfx Option Panel with Open Apple-Control-Escape (or Command-Control-Escape, for Macintosh users).

From the File menu, three options associated with the Apple IIfx screen are available:

- Show Apple IIfx Screen
- Save Apple IIfx Screen...
- Print Apple IIfx Screen...

From the Edit menu there is one option that is associated with the Apple IIfx screen:

- Copy Apple IIfx Screen

- 2) In the Apple IIfx Option Panel, select the Slots icon in the left side scrolling window. Place the Printer Card icon in an appropriate slot

(generally Slot 1).

NOTE: The icon labeled Serial Card with a plain printer icon is not the correct icon. The correct icon is labeled Printer Card. This icon has more printer detail.

- 3) Select the Printer Card icon in the left side scrolling window of the Option Panel. Then select the Chooser from the Apple menu. Choose the ImageWriter icon and select the Modem icon for the printer port. Close the Chooser.
- 4) To confirm the desired display of the Apple IIe screen, select the Show Apple IIe Screen item from the File menu. A reduced view of the Apple IIe screen displays in a Macintosh window. If the Apple IIe screen is 40 columns wide, the reduced view is readable. If the screen is 80 columns wide, the view is abstracted.
- 5) To print the Apple IIe screen, select the File menu item "Print Apple IIe Screen..." This brings up the Macintosh ImageWriter dialog. Click OK to print the Apple IIe screen to the ImageWriter.

#### Save Screen to Disk or Clipboard

-----  
In a similar manner, you can save the Apple IIe screen to a MacPaint file by selecting "Save II Screen..." from the File menu. Or you can copy the Apple IIe screen to the Macintosh Clipboard by selecting "Copy Apple IIe Screen" from the Edit menu.

Pressing Command-Shift-3 also saves the current screen to disk as a PICT file. Once you've saved the file, you can open MacPaint or any other paint program to print the PICT file.

## Macintosh Monitors: Screen Size and Page Rulers Compared (10/95)

Revised: 10/12/95  
Security: Everyone

Macintosh Monitors: Screen Size and Page Rulers Compared (10/95)

Article Created: 15 October 1991  
Article Reviewed/Updated: 11 October 1995

TOPIC -----

When I run my word processing program on different size Macintosh monitors, the program displays the same ruler width.

Why does the 12-inch RGB monitor display the same ruler width as the 9-inch monitor?

DISCUSSION -----

Page rulers on a Macintosh monitor is determined by the number of pixels available, not by the physical screen size. The Macintosh Classic (and other compact Macintosh 9-inch screens) and the 12-inch RGB monitor are 512 pixels wide, so they display the same ruler length.

Even though the ruler width of the two monitors is the same, the 9-inch monitor is 342 pixels tall, while the 12-inch RGB monitor is 384 pixels tall. The 13-inch RGB monitor and the 12-inch monochrome monitor are 640 pixels wide and 480 pixels tall.

## Ofoto 2: Improved Copy and Paste Function (6/93)

Revised: 6/2/93  
Security: Everyone

Ofoto 2: Improved Copy and Paste Function (6/93)

Article Created: 30 October 1991

### Article Change History

06/02/93 - REPLACED & RETITLED

- Article talks about improvements of Ofoto 2 over Ofoto 1.

### TOPIC -----

This article compares the RAM requirements for copy and paste in Ofoto versions 1 and 2.

### DISCUSSION -----

The cut, copy, and paste functions of Ofoto 1 versions weren't optimized for working with other applications. For example, if you scanned a 4 x 5 inch, 300dpi gray scale image, and selected and copied it while in Ofoto, it was difficult to exit Ofoto and enter another application to paste the image. You'd frequently see the error "Not enough memory to export this Clipboard" with Ofoto 1 versions. This operation required large amounts of RAM and disk space.

Ofoto 2 completely redesigned the cut, copy, and paste code. It's now possible to copy large, full color (as well as gray scale) images in Ofoto and move to another program to paste them in. It no longer requires large amounts of RAM and disk space.

On a related issue, the 2048K suggested partition size for Ofoto is a good beginning. However, a larger partition improves performance for all functions of Ofoto, not just for copy and paste.

Security: Everyone

LaserWriter IINT, IINTX, and Personal LaserWriter NT: Font IDs

=====

Article Created: 9 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I need the Adobe library numbers of the fonts in the ROMs of the LaserWriter IINT, IINTX, and Personal LaserWriter NT. I will buy additional fonts, but don't want to duplicate those already in the LaserWriter.

DISCUSSION -----

The Helvetica, Times, Symbol and Courier included with the LaserWriter printers mentioned don't have numbers; they are available only with ATM. ATM users are probably the only ones who would ever want a PostScript version of the font, since ATM uses the PostScript font to create the on-screen representation.

Here are the font library numbers for the others:

| Font Number | Font                   |
|-------------|------------------------|
| -----       | ----                   |
| 1           | Palatino               |
| 2           | ITC Bookman            |
| 3           | ITC Zapf Chancery      |
|             | ITC Zapf Dingbats      |
| 4           | ITC Avant Garde Gothic |
| 5           | New Century Schoolbook |

None of the font libraries has Helvetica Narrow.

I have these questions about setting up a security zone:

- 1) Can I change any part of the name? For instance, change the first 3 letters to conform with our naming convention.
- 2) If two or more security zones are introduced to the network, do I have to type multiple passwords? If I have one password, will it work for the entire network? Is it possible for two security zones to be on the network?
- 3) If I create a security zone with a password to set up the network properly, and the zone goes away, does the password continue to work? If a second zone is then introduced, will it continue to function or will I need a new password?

DISCUSSION -----

- 1) No part of the SecurityZone name can deviate from that produced by the Security Stack. There are three characters that could be used before the 32-character zone name limit is exceeded, but then the AppleTalk Remote Access stations won't recognize it as a security zone.
- 2) You can have up to 16 security zones on a network. Each must have a different password (implied due to zone naming rules), and a user setting up a server need only know one of them. The software will search the entire zone list for a security zone with a matching password. This allows the administrator to group authorized servers and enable or disable groups as needed.

- 3) Just to clarify, a security zone will affect any AppleTalk Remote Access station on the same AppleTalk network, be it a LAN or WAN. The entire zone list is searched, and if a security zone is present, a password will be required. This is checked both at the time the answering station is set up, and during each connection attempt.

If you set up the answering station while disconnected from the network, the software wouldn't see the zone, and wouldn't ask for the password. But once you reconnected, and a remote user dialed in, the software would see the security zone and disable remote access. The same would happen if the security zone were set up after a station was set up to answer calls.

Also, there is a potentially annoying problem with the Security Stack used to generate the DES encrypted zone name. The field used to display the password is a couple of pixels too narrow and truncates the last character of the encrypted password. If you create a zone with this errant zone name, none of the answering stations will recognize it as a security zone.

The way to fix this is to widen the field slightly so the final character is visible. Use the HyperCard field tool (in authoring mode) to stretch the field bounds as needed, or enter the following command from the message window. It will correct the Zone field width to show the entire zone name.

```
set width of cd fld "Zone" to 236
```

## AppleTalk Remote Access: HayesConnect Requires Update (1/95)

Revised: 1/31/95  
Security: Everyone

AppleTalk Remote Access: HayesConnect Requires Update (1/95)

=====

Article Created: 30 October 1991  
Article Reviewed/Updated: 31 January 1995

TOPIC -----

I installed the AppleTalk Remote Access 1.0. There seems to be a conflict with my internal Hayes 2400M modem and the HayesConnect serial port redirector CDEV. When I try to connect with AppleTalk Remote Access, it informs me that another application is using the serial port. When I try to use AppleLink 6.1, and click OK to require the serial port, AppleLink quits and my Macintosh freezes. All goes well if I remove all AppleTalk Remote Access files.

### Configuration:

- Macintosh IICx with 8MB memory
- System software version 7.0
- HayesConnect CDEV 1.0D

DISCUSSION -----

A bug exists in the HayesConnect serial port redirector. It is recommended that you contact Hayes Microcomputer for an update.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

## PowerBook: Battery DA Manual Correction (6/92)

Revised: 5/17/94  
Security: Everyone

PowerBook: Battery DA Manual Correction (6/92)

Article Created: 30 October 1991  
Article Reviewed/Updated: 1 June 1992

TOPIC -----

The Battery DA is programmed to "lose" the lightning bolt when the battery goes into trickle charge. This isn't an intuitive course for the Battery DA to follow. The user's manual on page 96 says that "when the power adapter is plugged in, the Battery DA will show a lightning bolt through the battery graphic." This is not happening.

DISCUSSION -----

The PowerBook user manuals are being updated to address errors that were discovered, including the one you've identified. Current product inventory will still have the original manuals.

SUM: Don't Install on a Server

=====

Article Created: 31 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I've received these two similar problem reports:

- 1) I have the SUM Shield INIT installed on my Macintosh. When I try to trash a file or folder while file sharing with another Macintosh, my system freezes.
- 2) I have the SUM Shield INIT installed on my server. Whenever I try to trash anything on the server from a Macintosh on the network, I get an error message saying that the item could not be found.

DISCUSSION -----

According to Symantec, the solution is to not install SUM on a server. This problem happens when both the client and the server have the SUM Shield INIT in their System Folders. The SUM software is not intended for use on a server.

On AppleLink, you can find contact information on Symantec by clicking the "Library Index" button in the lower-center of the Tech Info Library search window, then opening the "Third Party Company Directory" folder.

System 7: Floppy Disk Copy Anomaly

=====

Article Created: 31 October 1991  
Article Reviewed/Updated: 21 November 1995

TOPIC -----

I copied a floppy disk by dragging it onto another floppy disk and got some strange results.

The original disk had one folder with two files in it and another file on the same level as the folder. When I opened the duplicate disk after the copy was complete, it had the folder with the two files in it and three files on the same level as the folder: the original file plus a copy of each file in the folder.

DISCUSSION -----

Although we couldn't reproduce this consistently, we determined that this happens only when the original floppy disk is set to view in outline format. When the outline format is closed, the disk copy performs as usual.

This problem only occurred with the first release of System 7.

## System 7: How to Avoid PrintMonitor Corruption

Revised: 5/23/95  
Security: Everyone

System 7: How to Avoid PrintMonitor Corruption

Article Created: 31 October 1991

### Article Change History

09/21/92 - UPDATED

- To provide information about System 7 Tune-Up and LaserWriter driver version 7.1.1.

### TOPIC -----

This article lists several steps to follow to help you avoid PrintMonitor corruption.

### DISCUSSION -----

The primary reason for corruption of the System 7 PrintMonitor is the LaserWriter driver version 7.0. The best way to avoid problems with PrintMonitor in the future is to install System 7 Tune-Up, which contains version 7.1.1 of the LaserWriter driver (or a version of system software greater than 7.01).

If you have not obtained and installed System 7 Tune-Up yet, or you think your PrintMonitor may be corrupted despite Tune-Up, follow the steps below.

- 1) Remove any jobs that are printing or are waiting to be printed from the PrintMonitor Documents folder.
- 2) Reinstall the Printing software.
- 3) Launch PrintMonitor and from the File menu select Preferences.
- 4) Configure PrintMonitor to display its window when printing by clicking the Yes button for that item.

- 5) Click the PrintMonitor application, and from the File menu select Get Info.
- 6) Increase the amount of memory allocated to PrintMonitor by increasing the amount of RAM shown for the Current size item of the Memory box in the Get Info window. We suggest doubling the 80K default allocation if you have that amount of memory available. Remember, this new amount of RAM needs to be available for background printing to start.
- 7) Lock the Get Info window by clicking the Locked box and close the window.
- 8) Create a new folder in the root level of your hard disk called PrintMonitor Backup. Option-drag a copy of the newly configured PrintMonitor to the PrintMonitor Backup folder.
- 9) Ensure that Background Printing is selected in the Chooser and restart your Macintosh.

#### Notes

-----

- DO NOT quit the PrintMonitor application when a job is printing (with System 7 Tune-Up and LaserWriter 7.1.1 this is no long a problem).
- If you suspect your PrintMonitor application has become corrupted:
  - 1) Trash your original version of PrintMonitor. (Remember to unlock it via the Get Info window first.)
  - 2) Option-drag a copy of the uncorrupted PrintMonitor application from the PrintMonitor Backup folder to the Extensions folder.

## LaserWriter II: New Toner Cartridge Characteristics

Revised: 11/22/91  
Security: Everyone

LaserWriter II: New Toner Cartridge Characteristics

=====

Article Created: 8 November 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I've heard that Apple has been shipping a toner cartridge with new toner for the LaserWriter II for some time. How is this toner cartridge different from the former toner cartridge? Is there a new or updated Safety Data Sheet for this toner?

DISCUSSION -----

Several months before the introduction of the Apple LaserWriter IIg and LaserWriter IIx, Apple started shipping a new toner cartridge for the LaserWriter II family of printers. This new toner cartridge has an improved mechanism that provides more consistent feeding of toner to the paper. This is only noticeable when printing gray scale on the Apple LaserWriter IIg and LaserWriter IIx. There was also a change in the cartridge that helps prevent toner leaks.

Any toner cartridges that you find in stores today will be of the new variety. Externally, there is no way to tell the old cartridge from the new one.

There is no change to the Materials Safety Data Sheet.

## Quadra Series, Centris Series: Displays, Video Pinouts (8/93)

Revised: 8/10/93  
Security: Everyone

Quadra Series, Centris Series: Displays, Video Pinouts (8/93)

Article Created: 7 November 1991  
Article Reviewed/Updated: 5 August 1993

TOPIC -----

This article details how to wire the video connector sense pins to access all the supported video modes of the Macintosh Quadra series and the Macintosh Centris series.

DISCUSSION -----

The Macintosh Centris and Quadra frame buffer determines what type of display is attached to the video connector by examining the state of 3 sense line pins. The following chart details how these three pins must be wired for each of the supported display types. For each supported display, the screen resolution (horiz. pixels X vertical pixels), bandwidth, and the vertical and horizontal scan rates are listed.

The Macintosh Quadra series and the Macintosh Centris series should support any display, whether from Apple or from another vendor, that meets one of the following specifications:

STANDARD SENSE CODES:

| Display            | Sense pins |       |       | Hor x Vert<br>(Pixels) | Band<br>Width<br>(MHz) | Vert<br>Refrsh<br>(Hz) | Horiz<br>Refrsh<br>(KHz) |
|--------------------|------------|-------|-------|------------------------|------------------------|------------------------|--------------------------|
|                    | 10         | 7     | 4     |                        |                        |                        |                          |
| -----              | -----      | ----- | ----- | -----                  | -----                  | -----                  | -----                    |
| Apple 21 Color     | 0          | 0     | 0     | 1152 x 870             | 100                    | 75                     | 68.7                     |
| Apple Portrait     | 0          | 0     | 1     | 640 x 870              | 57.2832                | 75                     | 68.9                     |
| 12" AppleColor RGB | 0          | 1     | 0     | 512 x 384              | 15.6672                | 60.15                  | 24.48                    |
| Apple 2-Page Mono. | 0          | 1     | 1     | 1152 x 870             | 100                    | 75                     | 68.7                     |

|      |   |   |   |                   |         |       |      |
|------|---|---|---|-------------------|---------|-------|------|
| NTSC | 1 | 0 | 0 | underscan-512x384 | 12.2727 | 59.94 | 15.7 |
|      | 1 | 0 | 0 | overscan- 640x480 | 12.2727 | 59.94 | 15.7 |

(To produce a color NTSC signal, a RGB-to-NTSC converter is required.)

|                               |   |   |   |           |       |      |      |
|-------------------------------|---|---|---|-----------|-------|------|------|
| 12" Apple High-Res Monochrome | 1 | 1 | 0 | 640 x 480 | 30.24 | 66.7 | 35.0 |
| 13" AppleColor High-Res RGB   | 1 | 1 | 0 | 640 x 480 | 30.24 | 66.7 | 35.0 |

|                                    |  |  |  |           |       |    |      |
|------------------------------------|--|--|--|-----------|-------|----|------|
| Apple 16" Color Disp. (See Note 4) |  |  |  | 832 x 624 | 57.63 | 75 | 49.7 |
|------------------------------------|--|--|--|-----------|-------|----|------|

|                                |   |   |   |           |         |    |      |
|--------------------------------|---|---|---|-----------|---------|----|------|
| Portrait Color, such as Radius | 1 | 0 | 1 | 640 x 870 | 57.2832 | 75 | 68.9 |
|--------------------------------|---|---|---|-----------|---------|----|------|

#### NOTES:

- 1) NOTE: Sense pins 4, 7, and 10 are referred to as MON.ID1, MON.ID2, and MON.ID3 in the Macintosh Quadra pinout table or SENSE0, SENSE1, and SENSE2 in pinout tables for the video connectors.

A sense pin value of 0 means that pin should be grounded to the C&VSYNC.GND signal; a value of 1 means do not connect the pin.

- 2) Extended sense codes will be examined if the following sense code is detected: 1 1 1.
- 3) The terms 'underscan' and 'overscan' are used to describe the active video resolution for NTSC and PAL modes. Underscan means that the active video area appears in a rectangle centered on the screen with a black surrounding area. This ensures that the entire active video area always is displayed on all monitors. Overscan utilizes the entire possible video area for NTSC or PAL. However, most monitors or televisions will cause some of this video to be lost beyond the edges of the display, so the entire image will not be seen.
- 4) The Apple 16" Color Display should have pins 4 and 10 tied together and pin 7 should be unconnected. If used with a Macintosh Display Card, the Apple 16" Color Display also requires the Macintosh Display Card 4•8, 8•24, or 8•24 GC with revised ROMs.

#### EXTENDED SENSE CODES:

NOTE for extended sense codes: Sense pin pair value of 0 means those pins should be tied together (as opposed to grounding 10, 7, or 4 to pin 11); value of 1, do not connect. DON'T wire any of these pins to ground.

| Display                                 | Sense pins<br>4-10 10-7 7-4 | Hor x Vert<br>Pixels | Bandwidth<br>(MHz) | Refresh<br>(Hz) | Scan<br>(KHz) |
|-----------------------------------------|-----------------------------|----------------------|--------------------|-----------------|---------------|
| -----                                   | -----                       | -----                | -----              | -----           | -----         |
| 16-inch Color,<br>such as<br>E-Machines | 0 1 1                       | 832 x 624            | 57.2832            | 75              | 49.7          |

PAL

---

PAL has two wiring options, using the extended sense pin configuration. To produce a color PAL signal, an RGB-to-PAL converter is required.

|              |   |   |   |                   |       |    |        |
|--------------|---|---|---|-------------------|-------|----|--------|
| PAL Option 1 | 0 | 0 | 0 | underscan-640x480 | 14.75 | 50 | 15.625 |
|              |   |   |   | overscan-768x576  | 14.75 | 50 | 15.625 |

|              |   |   |   |                   |       |    |        |
|--------------|---|---|---|-------------------|-------|----|--------|
| PAL Option 2 | 1 | 1 | 0 | underscan-640x480 | 14.75 | 50 | 15.625 |
|              |   |   |   | overscan-768x576  | 14.75 | 50 | 15.625 |

This sense code also requires a diode between sense pins 10 and 7, with anode towards pin 7, cathode towards pin 10.

#### NOTES:

- The Macintosh Quadra 700 and 900 support PAL Option 1 at up to 8 bpp.
- The Macintosh Centris 610, 650, and Quadra 800 support PAL Option 1 at up to 16 bpp.
- The Macintosh Quadra 950 supports PAL Option 1 up to millions of colors.

| 12 -----        | Vsync ----- 14                                      |
| 14 -----        | Sync Ground ----- 10                                |
| 10 -----        |                                                     |
| 7 -----         | Connect 7 and 10 so the sense pin ID will equal VGA |

There are a few issues to keep in mind with VGA monitors:

- VGA monitors will vary depending on the vendor. Check with the vendor about Macintosh Centris and Quadra compatibility before buying, or better yet, actually try the monitor with a Centris or Quadra to see if it works and if the quality is acceptable.
- Vendors have different image quality specifications. There may be significant differences between Apple monitors and the wide range of VGA monitors. Do a side-by-side comparison of the monitors you are considering before buying.
- Many third party cable vendors have off-the-shelf cables that should work.

MACINTOSH QUADRA TO NTSC VIDEO CABLE EXAMPLE:

Most NTSC devices use a RCA-type phono-connector and the following diagram uses that as a reference point. A cable wired as follows may allow many different brands of NTSC monitors to work on a Macintosh Centris or Quadra. We advise you to test the monitor on one of these machines prior to purchase to see if it meets your expectations.

Adjust the phono-connector side to whatever type of connector is used (RCA, BNC, etc.). "Tip" is the pin in the center of the connector (the signal); the sleeve is the flange around the outer edges of the connector (the chassis ground).

| Card Connector |                     | RCA-Type Phono-Connector |          |
|----------------|---------------------|--------------------------|----------|
| -----          |                     | -----                    |          |
| 4              | MON.ID1 (sense0) -- |                          |          |
| 7              | MON.ID2 (sense1) -- |                          |          |
| 11             | C&VSYNC.GND -----   |                          |          |
|                |                     |                          |          |
| 5              | GRN.VID ----->      | Tip                      | (signal) |
| Shell          | CHASSIS.GND ----->  | Sleeve                   | (ground) |

By grounding pin 4 and pin 7 to pin 11, the Macintosh Centris and Quadra CPUs are told that an interlaced (NTSC) monitor is attached. The actual black and white video signal is on pin 5 and connects to the center (Tip) of the phono-plug. The shell of the card connector connects to the sleeve of the phono-plug.

To acquire a color NTSC signal from a Quadra (or any Apple Macintosh display card), an RGB-to-NTSC converter is required, such as those available from RasterOps, Truevision, and Computer Friends. We do not have the cable requirements for any of these interface devices.

## Macintosh Quadra: Excess VRAM Gives No Performance Gain

Revised: 8/6/92  
Security: Everyone

Macintosh Quadra: Excess VRAM Gives No Performance Gain

=====

Article Created: 7 November 1991  
Article Last Reviewed: 5 August 1992  
Article Last Updated:

TOPIC -----

Does extra VRAM in the Macintosh Quadra improve speed? For example, if I install 2MB of VRAM in a Macintosh Quadra and use a 13-inch RGB set to 256 colors, I get 1.5MB more than what is needed to display 256 colors. Does this improve the video performance/speed compared to 0.5MB?

DISCUSSION -----

Having extra VRAM available on a Macintosh Quadra beyond what is required to support a particular pixel depth doesn't give any performance increase.

This is not true for the Macintosh Display Card 8•24 GC, where the additional and optional DRAM space is used for off-screen data structures.

## Macintosh Quadra: VRAM and Pixel Depth

Revised: 3/23/93  
Security: Everyone

Macintosh Quadra: VRAM and Pixel Depth

Article Created: 8 November 1991

### Article Change History

-----  
03/23/93 - RETITLED  
• To match another similar article.

### TOPIC -----

I'm confused on the VRAM issue. If I can't run a 21-inch monitor in 24-bit using the full 2MB of VRAM, and I can run a 16-inch in 24-bit with only 1MB of VRAM, then what would I use the full 2MB of VRAM for? A 19-inch monitor maybe?

### DISCUSSION -----

The Macintosh Quadra 700 and 900 built-in video supports the Apple 21-inch color and monochrome monitors to 8-bit, 256 colors only. Adding VRAM beyond 1MB to the Macintosh Quadras when using these monitors is not beneficial; to achieve greater pixel depth on the 21-inch color monitor, you'll need a third-party video NuBus card.

A 19-inch monitor that matches the characteristics of other monitors the Macintosh Quadra supports may work; however, none of the other monitors are specifically 19-inch monitors.

The following chart should help explain the video expansion options available on the Macintosh Quadras today. Note that this information should supersede any information you have received thus far.

The following chart lists the Macintosh Quadra 700 and 900 internal video's maximum pixel depths supported, depending upon the VRAM configuration:

| Display size<br>-----                               | 512K VRAM<br>----- | 1MB VRAM<br>----- | 2MB VRAM<br>----- |
|-----------------------------------------------------|--------------------|-------------------|-------------------|

| 16-inch Color<br>832 x 624                          | 8 bpp              | 8 bpp             | 24 bpp            |
| 2-Page Display (b/w)<br>870 x 1152                  | 4 bpp              | 8 bpp             | 8 bpp             |
| 21-inch Color<br>870 x 1152                         | 4 bpp              | 8 bpp             | 8 bpp             |
| PAL with convolution                                | n.a.               | 8 bpp             | 8 bpp             |
| PAL without convolution                             | 8 bpp              | 8 bpp             | 24 bpp*           |
| NTSC with convolution                               | n.a                | 8 bpp             | 8 bpp             |
| NTSC without convolution                            | 8 bpp              | 8 bpp             | 24 bpp            |

\* Note: there are two ways to wire a video cable for connecting a PAL monitor to a Macintosh Quadra; only by using the proper extended sense code are you able to achieve 24 bits per pixel. For details, search under "Quadra" and "video sense pinouts".

Note that 512K of VRAM is the minimum configuration for the Macintosh Quadra 700; it is 1MB of VRAM for the Macintosh Quadra 900.

## System 7: MODE32 Technical Information (9/94)

Revised: 9/13/94  
Security: Everyone

System 7: MODE32 Technical Information (9/94)

Article Created: 30 September 1991  
Article Reviewed/Updated: 12 September 1994

TOPIC -----

Apple's announcement regarding the licensing of MODE32 from Connectix prompted a number of questions about how MODE32 works at a technical level. This document addresses these issues.

DISCUSSION -----

MODE32 is system-level software designed for Macintosh II class systems with ROMs that aren't 32-bit clean (Macintosh II, Macintosh IIX, Macintosh IICx, and Macintosh SE/30). This became an issue with the release of System 7, because these computers can't run in 32-bit mode. MODE32 allows these computers to run in 32-bit mode.

When installed, MODE32 directly modifies the System file. Virus utilities report this, and may interfere with installation. Turn virus utilities off for the installation.

Modifications to the System file involve:

- 1) Total replacement of the Memory Manager with a 32-bit clean Memory Manager. This is the biggest change made. Without a 32-bit clean Memory Manager, you can't use 32-bit addressing.
- 2) Minor patches to certain ROM routines that aren't 32-bit clean. This involves patching specific routines in some managers, not replacing the entire manager as is the case with the Memory Manager.

NOTE: The MODE32 Control Panel (not the Memory Control Panel) can remove most of the resources it installed in the System file. The only portion MODE32 can't remove is a "ptch" resource in the System file, modified to allow 32-bit addressing on older Macintosh computers. To return to a golden master version of System 7, you must reinstall it from Master disks. This should not be an

issue, as the updated "ptch" resource works in both 24-bit and 32-bit mode. We aren't aware of any problems when using this modified resource instead of the original.

When you turn your Macintosh on (or restart it), MODE32 executes at the earliest point possible in the startup process. Here is the sequence of events:

- 1) The Macintosh starts up in 24-bit mode.
- 2) Drivers load into 24-bit space from each of the installed NuBus cards and from any attached hard drive.
- 3) MODE32 executes.
- 4) MODE32 issues a close call to open drivers, switches in the 32-bit Memory Manager, and then reloads the drivers into 32-bit space. We call this process the "stutter start."
- 5) System start up proceeds normally from this point, and includes loading the other MODE32 patches to specific ROM routines.

NOTE: Some third-party NuBus cards don't have 32-bit clean drivers in their ROMs. Computers with these cards installed, and 32-bit addressing turned on, will fail to start up. The symptom you are most likely to see is repeated unsuccessful attempts to start up. Many manufacturers of cards that aren't 32-bit clean have ROM upgrades that resolve this issue. Disk drivers that are not 32-bit clean are also an issue. Contact the vendor of your drive software and obtain a vendor-certified 32-bit clean version.

#### Hardware Issues

-----  
The main benefit of 32-bit addressing is the ability to address more than 8MB of physical RAM. Even with 8MB of RAM you gain access to more virtual memory, assuming you have either a 68030-based Macintosh or a Macintosh II with a PMMU installed. A side benefit of 32-bit addressing when using virtual memory is that your address space is contiguous. This isn't true in 24-bit mode since ROM is mapped directly above the 8MB allocated for RAM. In 24-bit mode, any virtual memory allocated beyond 8MB is not contiguous with the first 8MB.

Macintosh II and Macintosh IIfx computers require special 4MB SIMMs to give you more than 8MB of RAM. You should specifically request these SIMMs, and the vendor you purchase RAM from should be aware of the difference.

NOTE: To take advantage of more than 8MB of physical RAM in a Macintosh II, you must have a PMMU installed. When a Macintosh II starts up, MODE32 uses the PMMU to give you access to the additional RAM. Also, a Macintosh II won't start up if you have 4MB SIMMs in bank A. You'll hear chimes, indicating a hardware failure. However, you can install the 4MB SIMMs in bank B with 1MB or 256K SIMMs in bank A. The Macintosh II then starts up, and MODE32 uses the PMMU to give you access to the additional RAM.

When you turn the power on (not restart from the Special menu), your Macintosh performs a RAM test. However, older systems only check up to 8MB of RAM, so

anything beyond this isn't tested. MODE32 resolves this by checking anything greater than 8MB at the "happy Macintosh" screen. With large amounts of RAM, this can take a long time, and your computer can appear to freeze at this point.

#### Software Compatibility

-----  
We have no reports of 32-bit clean software incompatibilities with MODE32. In a few instances, problems with programs surfaced after installing MODE32.

NOTE: There is a version of Adobe Type Manager (2.0.2 or later) that is 32-bit clean. Be sure to use this version. The symptoms of a Macintosh running older versions of ATM make it appear as if applications may not be 32-bit clean, when the problem is actually an old version of ATM.

## PowerBook: HDI-30 Throughput (7/92)

Revised: 5/16/94  
Security: Everyone

PowerBook: HDI-30 Throughput (7/92)

=====  
Article Created: 7 November 1991  
Article Reviewed/Updated: 31 July 1992

TOPIC -----

I would like to match external hard disks to the Macintosh PowerBook 140 and 170. Can you tell me the throughput of the SCSI port on these PowerBooks?

DISCUSSION -----

The SCSI circuitry used on the Macintosh PowerBooks (and consequentially, the throughput of the port) is the same as that used in all Macintosh computers. The new HDI-30 SCSI port connector has the same signals as the DB-25 connector, and the HDI-30 throughput is the same as other Macintosh computers.

Hard disks compatible with the Macintosh IIci, for example, work with the Macintosh PowerBooks.

## AppleTalk Remote Access on Token Ring

Revised: 11/14/91  
Security: Everyone

AppleTalk Remote Access on Token Ring

=====

Article Created: 5 November 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Can I use AppleTalk Remote Access with Token Ring?

DISCUSSION -----

Yes. The TokenTalk installer that ships with the Token Ring 4/16 NB Card will include AppleTalk version 57, which is required for AppleTalk Remote Access.

NOTE: The AppleTalk Remote Access READ ME file states that "Answering calls on a Token Ring network is not supported as of TokenTalk version 2.2..." The new TokenTalk driver for the Token Ring 4/16 NB card utilizes AppleTalk version 57, which is required for AppleTalk Remote Access. So, AppleTalk Remote Access is now fully functional on a Token Ring network.

Apple Remote Access: AppleTalk Phase I and Phase II (7/94)

Article Created: 5 November 1991  
Article Reviewed/Updated: 29 July 1994

TOPIC -----

Can Apple Remote Access (ARA) work on Phase I and II AppleTalk networks?

DISCUSSION -----

No version of Apple Remote Access was tested on a network using AppleTalk Phase I and is therefore not supported. Although ARA may work on some network configurations that are using both AppleTalk Phase I and Phase II you do so at your own risk. There are no practical reasons for continuing to use Phase I on AppleTalk networks, Apple strongly recommends using Phase II.

Security: Everyone

AppleTalk Remote Access: AppleTalk v57 and Multinode (11/94)

=====

Article Created: 5 November 1991  
Article Reviewed/Updated: 28 November 1994

TOPIC -----

Does AppleTalk Remote Access (ARA) 1.0 use a new version of AppleTalk?

DISCUSSION -----

Yes. A new version of AppleTalk (version 57) was created specifically for AppleTalk Remote Access. One of the key components in version 57 is a new technology called "multinode." Multinode allows an AppleTalk device (that is, a Macintosh) to acquire and defend multiple AppleTalk nodes.

Apple Remote Access version 2.0 installs AppleTalk version 58.1.3 on your Macintosh.

NOTE: Some older routers may have problems in dealing with the multinode technology. In these rare cases, NBP lookups may not get returned, making it look as if there are no services on the network you've called.

Security: Everyone

AppleTalk Remote Access 1.0: Coexisting w/ Other Products 11/94

=====

Article Created: 5 November 1991  
Article Reviewed/Updated: 28 November 1994

TOPIC -----

Can I install and use these products on the same Macintosh with AppleTalk Remote Access (ARA) v1.0?

- AppleShare 2.0
- AppleShare Server 3.0
- AppleTalk Internet Router 2.0
- Apple SNA•ps Gateway

DISCUSSION -----

AppleShare 2.0

-----

AppleShare 2.0 doesn't work with System 7. Because AppleTalk Remote Access only runs on System 7, this combination won't work.

AppleShare Server 3.0

-----

AppleTalk Remote Access and AppleShare Server 3.0 work together on the same Macintosh. In this configuration, Remote Access users are administered via the AppleShare Server 3.0 Admin program.

AppleTalk Internet Router 2.0

-----

AppleTalk Remote Access and the AppleTalk Internet Router 2.0 cannot run concurrently on the same Macintosh.

Apple SNA•ps Gateway

-----

The SNA•ps Gateway product and AppleTalk Remote Access can reside and run on the same Macintosh.

## AppleTalk Remote Access 1.0: Memory Requirements (11/94)

Revised: 12/2/94  
Security: Everyone

AppleTalk Remote Access 1.0: Memory Requirements (11/94)

=====

Article Created: 5 November 1991  
Article Reviewed/Updated: 28 November 1994

TOPIC -----

How much memory does AppleTalk Remote Access (ARA) require in its minimum configuration? Can I run my favorite word processor and spreadsheet while maintaining a remote link to a network?

DISCUSSION -----

AppleTalk Remote Access 1.0 requires approximately 450K of RAM when calling into another Remote Access system; answering requires an additional 110K of RAM. Generally speaking, this would leave between 230-330K of memory free in a 2MB system for other activities.

You can quit the Remote Access application while maintaining the remote connection. This frees roughly 200K of memory.

AppleTalk Remote Access works well in a 2MB environment. But if you want to keep several applications open (using the multitasking feature of System 7) while maintaining a remote connection, you should consider increasing the RAM in your system.

What modems are compatible with AppleTalk Remote Access 1.0 (ARA) and Apple Remote Access 2.0?

DISCUSSION -----

ARA can work with any modem for which a special modem communications script has been written. AppleTalk Remote Access includes scripts for a variety of popular modems on the disks. Contact your modem vendor for updates to your modem script.

AppleTalk Remote Access includes scripts for the following modems:

### v.22/2400 bps Modems

-----  
All Apple 2400 bps modems  
Abaton InterFax 24/96  
Global Village TelePort  
Hayes SmartModem 2400  
Microcom Microport 1024  
Practical Peripherals 2400SA  
Prometheus 2400M  
Supra SupraModem 2400  
US Robotic Courier 2400e

### v.32/9600 & v.32bis bps Modems

-----  
DSI 9624 LE/LE Plus  
Hayes Ultra 96  
Farallon Remote V.32  
Microcom MacModem V.32  
MultiTech MultiModemV32  
Practical Peripherals 9600SA  
Prometheus ProModem Ultima  
Telebit T1600  
US Robotics Courier V.32 bis

Security: Everyone

AppleTalk Remote Access: Securing the AppleTalk Network

=====

Article Created: 5 November 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Are services and workstations on an AppleTalk network secure against unauthorized access from a dial-up link?

DISCUSSION -----

AppleTalk Remote Access has several sophisticated security options that allow both the individual user and the network administrator to restrict access to an individual computer or any network to which it is connected.

### User-Controllable Options

-----

- User name and password authentication. Callback verifies the user's identity by returning calls to a predetermined phone number.
- An Activity Log for recording calling and answering activities.
- Disabling of user account after seven incorrect password attempts.

### Network Administrator Options

-----

Answering authentication allows a network administrator to password-protect the network from unauthorized remote access. This is enabled by creating a unique security zone (SecurityZone\_) on the Internet. The administrator uses a special HyperCard stack to generate the SecurityZone and encrypted password.

This HyperCard stack and documentation is available on the two APDA AppleTalk Remote Access toolkits, on several on-line services, and on the Information Source CD-ROMs.

## Apple Remote Access and Personal File Sharing (6/95)

Revised: 6/9/95  
Security: Everyone

Apple Remote Access and Personal File Sharing (6/95)

=====

Article Created: 5 November 1991  
Article Reviewed/Updated: 9 June 1995

TOPIC -----

Can I use Macintosh File Sharing at the same time as Apple Remote Access (ARA)?  
Are other network services available to me through the Remote Access product?

DISCUSSION -----

Yes. Macintosh Personal File Sharing and Apple Remote Access Personal Server or Client can coexist on the same system without any problems. With this combination, access to files on your home or office computer is available from anywhere.

You cannot however, use the ARA MultiPort Server software concurrently with Personal File Sharing. The ARA MultiPort Server software uses the same Users & Groups file format as the AppleShare File Server, so Personal File Sharing is disabled. Also Apple Remote Access MultiPort Server is not compatible with AppleShare 3.0.x. AppleShare 4.0.1 and later are the correct AppleShare versions to use.

In addition, if the answering Macintosh is connected to an AppleTalk network, all the network resources like E-mail, file services, group calendars, host gateways, and so on (assuming the presence of network software and gateways needed) will be available. The only caveat is that the calling Macintosh must have the appropriate client software installed in order to use these services.

### Article Change History:

09 Jun 1995 - Added more information to ARA MultiPort Server compatibility.  
23 Jan 1995 - Correction to show ARA MultiPort Server and AppleShare.  
22 Jun 1994 - Updated information for ARA 2.0.

## AppleTalk Remote Access Doesn't Power On Remotely (8/93)

Revised: 11/28/94  
Security: Everyone

AppleTalk Remote Access Doesn't Power On Remotely (8/93)

=====

Article Created: 5 November 1991  
Article Reviewed/Updated: 3 August 1993

TOPIC -----

If the Macintosh I wish to dial into is not powered on, can AppleTalk Remote Access (ARA) wake it up?

DISCUSSION -----

AppleTalk Remote Access does not have the ability to turn on power to a remote Macintosh.

There are third-party "wake up" products you can use in conjunction with AppleTalk Remote Access. After you wake up the Macintosh with one of these products, you can call back the remote Macintosh and connect in the normal fashion with AppleTalk Remote Access. Sophisticated Circuits offers such a remote "wake up" product called PowerKey Remote.

## PowerBook: Disable ARA Answer Calls to Send Fax (11/94)

Revised: 11/29/94  
Security: Everyone

PowerBook: Disable ARA "Answer Calls" to Send Fax (11/94)

=====

Article Created: 8 November 1991  
Article Reviewed/Updated: 28 November 1994

TOPIC -----

I'm having difficulty sending a Fax from my Macintosh PowerBook 170 with internal AppleFax Modem. Everything seems fine until just after the Fax Monitor Status says "Imaging Document." I get a status of "Waiting for modem" and it never dials. I tried sending the sample document included with the Fax software as well as sending a document from within MacWrite. This seems to be a problem only with the Macintosh PowerBook 170 and Fax.

DISCUSSION -----

You need to disable the Remote Access Setup (ARA) "Answer Calls" option. As long as the Remote Access Setup "Answer Calls" option is enabled, the Macintosh PowerBook AppleFax Modem software will remain in a "Waiting for modem" status when trying to send a Fax.

## Data Access Language Server for A/UX: Description(Discontinued)

Revised: 10/17/96  
Security: Everyone

Data Access Language Server for A/UX: Description(Discontinued)

=====

Article Created: 11 November 1991  
Article Last Reviewed: 17 October 1996

TOPIC -----

This article describes the Data Access Language (DAL) Server for A/UX.

DISCUSSION -----

NOTE: The DAL technology was purchased by Independence Technologies, Inc. (ITI) in late 1993. Contact ITI for additional information on DAL.

The DAL Server for A/UX is a networking software product that provides DAL access to files and databases on an A/UX host system. The DAL Server runs on the A/UX host and works cooperatively with personal computer application programs that support DAL, such as spreadsheets, databases, and query tools on Macintosh computers.

A complete DAL connectivity setup for A/UX includes a client personal computer running an application program with embedded DAL support and an A/UX host Macintosh computer with the DAL Server. The DAL Server receives requests from the personal computer program, carries out the requests on the host Macintosh computer running A/UX, and sends the desired data back to the program for local processing.

The DAL Server for A/UX provides uniform support for DAL-based application programs, through a variety of network configurations and data management software. It works with existing databases, operating under standard A/UX and database security. You receive transparent access to the information in databases you are authorized to access.

### Features

-----

- Operation as a user process under standard A/UX user name/password security

- Uniform support for DAL clients
- Uniform concurrent support for A/UX databases
- Automated A/UX installation procedures
- Asynchronous operation
- Incremental compiler implementation
- Trace facility
- Interactive utility (IDAL) for testing DAL program statements
- Stored procedures
- Sample tables
- Wide range of commercial applications with DAL connectivity available today

#### Benefits

-----

- Maintains the security and integrity of A/UX and the database management system.
- Eliminates the need for new system administration procedures on the host Macintosh computer.
- Allows one server to support all Macintosh computers running DAL-compatible application programs.
- Insulates personal computer programs from the complexities of the database being used.
- Supports multivendor environments.
- Makes installation quick and easy.
- Allows the user to continue other work while the DAL Server performs a connectivity request.
- Returns program control to the Macintosh computer so that the user can perform other tasks while the DAL Server carries out the requested operation on the host.
- Reduces the client system processing load.
- Facilitates debugging and system tuning.
- Provides utilities to ensure proper connection, installation, and operation of host server.

# ..TIL09127-Data\_Access\_Language\_Server\_for\_A-UX-DescriptionDiscontinued.pdf

- Minimizes network traffic by storing commonly located procedures on the host, where they can be shared.
- Makes developing and testing applications easier.
- Provides spreadsheet, query tool, and mapping tool users with seamless host data integration without programming effort.

## DAL for A/UX: Details and System Requirements (9/94)

Revised: 9/21/94  
Security: Everyone

DAL for A/UX: Details and System Requirements (9/94)

=====

Article Created: 11 November 1991  
AArticle Reviewed/Updated: 21 September 1994

TOPIC -----

This article gives the product details, language specifications, and system requirements for using Data Access Language (DAL) for A/UX.

DISCUSSION -----

NOTE: As of December 1993, Independence Technologies, Inc. (ITI) took ownership of the DAL technology. Contact ITI for current product information.

### Product Details

-----

- Database Support
  - Informix version 2.1 or later
  - Ingres version 6.1 or later
  - Oracle version 6.0
- Client Support
  - Uniform support for any application developed with the DAL Developer's Toolkit for the Macintosh using a supported network
- Network Support
  - Asynchronous direct and dial-up connections
  - Support for TCP/IP standard UNIX network protocol using Apple's MacTCP software program on the Macintosh computer.
- Asynchronous Communications
  - Transmission speed: 300 to 19,200 baud
  - Character length: 7 or 8 data bits; 1 or 2 stop bits
  - Parity: odd, even, or none
  - Handshake
    - XON/XOFF and none

- Modem and direct connections
- Log-on sequence specification
- Protocol
  - Error-correcting (16-bit CRC)
  - Data compression
  - Binary data transparency

#### Language Specifications

-----

DAL is a complete language for describing connectivity tasks. It consists of these statement groups:

- Host Connection Statements  
These establish and terminate a connection to a host system in the network. This provides concurrent access to multiple hosts running DAL Servers.
- Data Manipulation Statements  
These offer complete ANSI standard level 1, SQL-based data access to host databases.
- Program Structure Statements  
These support testing, looping, and procedure calls within a DAL program.
- Output Statements  
These generate output messages from the DAL program. The client application software processes these messages.

#### System Requirements

-----

To use the DAL Server for A/UX, you need the following hardware and software:

- Host environment: A/UX version 2.0 or later. We recommend the A/UX CD-ROM product or the A/UX floppy product. We don't recommend the A/UX external 80MB hard disk because it doesn't contain the software you need to repartition the disk for the DAL Server for A/UX.
- One of the supported database management systems
- Macintosh computer clients running DAL-compatible application programs.
- The appropriate networking hardware and software

## A/UX Version 3.0: Description

Revised: 6/20/94  
Security: Everyone

A/UX Version 3.0: Description

=====

Article Created: 11 November 1991  
Article Reviewed/Updated: 3 July 1992

TOPIC -----

This article describes version 3.0 of the A/UX operating system.

DISCUSSION -----

The Apple A/UX 3.0 operating system integrates the Macintosh System 7 interface with industry-standard UNIX.

You can simultaneously run Macintosh, UNIX, X Window System, MS-DOS, and Motif applications -- each appearing in a window on the Macintosh desktop. You can switch from one application to another and copy and paste among these different applications.

A/UX complies with all relevant UNIX standards, combining features from two different versions of UNIX: AT&T's System V and Berkeley Software Distribution (BSD) 4.3. A/UX then adds the familiar Macintosh desktop and a high level of Macintosh-UNIX integrations so that you can perform UNIX tasks in whatever way is most comfortable:

- Using the UNIX command line
- Using the Macintosh graphical interface
- Using the X Window System interface
- Using Macintosh-style front ends to standard UNIX commands

Features

-----

- Standards Compliance
  - AT&T UNIX System V, Release 2, Version 2
  - Compliant with the System V Interface Definition (SVID); passes the

## ..TIL09129-A-UX\_Version\_3-0-Description.pdf

### System V Verification Suite (SVVS)

- BSD 4.3 extensions, including signals, job control, groups, sockets, TCP/IP and Berkeley File System
- Certified by the U.S. government as compliant with FIPS #151-1 (IEEE POSIX 1003.1 -- 1991 and ISO 9945-1 standards)
- UNIX Command-line Interpreters for UNIX Shell Windows
  - Bourne Shell
  - Korn Shell (1988)
  - C Shell
- Installation and System Administration
  - Autorecovery
  - Autoconfiguration
  - Scripts for system administration functions
  - One-button Easy Install option to install the entire A/UX system
  - Modular installation to select parts of the system
  - New version of Apple Hard Disk SC Setup
- Macintosh Ease of Use and UNIX Functionality
  - UNIX command-line builder (Commando)
  - UNIX terminal emulator or "shell" windows (CommandShell)
  - Macintosh-style text editing (TextEditor)
  - Printer and AppleShare file access via the Chooser
  - AppleTalk Network selection via control panels
  - X Window System (X11 for A/UX and MacX 1.1.7)
  - Macintosh-style startup and shutdown
  - Access to Macintosh file systems on hard drives, floppy disks, CD-ROM, and AppleShare file servers
- Applications Supported
  - Macintosh applications (those that adhere to the guidelines in the publication "Inside Macintosh and A/UX Toolbox: Macintosh ROM Interface")
  - UNIX applications
  - X Window System applications
  - Macintosh hybrid applications (make A/UX system calls)
  - UNIX hybrid applications (make Macintosh Toolbox calls)
  - MS-DOS applications (using SoftPC from Insignia Solutions, Inc.)
  - Motif applications (OSF/Motif for A/UX is available from Integrated Computer Solutions)
- Development Tools
  - Text editing and processing utilities (TextEditor, and the traditional UNIX tools: vi, ex, ed, ditroff, nroff, tbl, eqn, grap, and pic)
  - Assembler, C compiler, and ANSI standard Fortran compiler
  - Shared libraries
  - Language tools (lint, lex, yacc)
  - Debuggers (adb, dbx, sdb)
  - Linker (ld)
  - Source control (sccs, rcs, make, and other UNIX tools)
- International Support

## ..TIL09129-A-UX\_Version\_3-0-Description.pdf

- Accepts 8-bit characters and alternative character sets, so that Macintosh and A/UX developers can create A/UX applications in many languages, including Danish, Dutch, Finnish, Flemish, French, German, Italian, Norwegian, Portuguese, Spanish, and Swedish
- Additional Hardware and Software Support
  - Serial printing lets you print documents on a serially connected LaserWriter or ImageWriter printer
  - SuperDrive allows you to store data on and retrieve data from 400K, 800K, or 1.44MB floppy disks
  - Slot Manager and Serial Manager enable use of Macintosh applications that access the Macintosh Toolbox Slot Manager and Serial Manager software
  - Sound input and output (Macintosh Sound Manager)
  - Macintosh Communications Toolbox lets an application "talk" to the Macintosh Toolbox without requiring the application to designate a communications protocol
  - 24-bit mode lets older Macintosh applications that are not 32-bit clean run in A/UX
- Networking and Communications
  - Macintosh built-in file sharing via LocalTalk or EtherTalk
  - TCP/IP networking including BSD 4.3 remote login and execution, resource sharing, file transfer, electronic mail, and domain name services
  - CSL/IP support allowing connection to a TCP/IP-based network over a serial connection
  - Automounter for dynamic mounting of remote data as needed
  - Transparent file sharing over Ethernet or serial lines using NFS Version 4.1
  - Network Information Service (NIS), providing a distributed look-up service
  - AppleTalk printing and file sharing client services via LocalTalk or Ethernet
  - AppleTalk protocol support including ADSP for UNIX and Macintosh applications
  - MacTCP 1.1, allowing use of Macintosh applications that access TCP/IP connectivity
  - X Window System server and client applications
- Highlights of hardware supported
  - Macintosh Quadra 700, Macintosh Quadra 900, Quadra 950 and all Macintosh II personal computers, and the Macintosh SE/30
  - Apple 20MB, 40MB, 80MB, 160MB, and 400MB hard disk drives and compatible third-party hard disk drives
  - Apple 400K, 800K, and 1.44MB floppy disk drives
  - Apple Ethernet NB Card, compatible third-party Ethernet cards, and on-board Ethernet
  - AppleCD SC drive, which provides CD-ROM support for both UNIX and Macintosh file systems, including support for many compatible third-party CD-ROM drives
  - LaserWriter IIx, LaserWriter IIg, LaserWriter IINT, LaserWriter IINTX, LaserWriter Plus, Personal LaserWriter NT, ImageWriter II,

# ..TIL09129-A-UX\_Version\_3-0-Description.pdf

ImageWriter LQ, and StyleWriter printers

- Apple Scanner and Apple OneScanner
- All Macintosh monitors and compatible third-party monitors, including support for multiple monitors
- All domestic Macintosh keyboards and European Macintosh keyboards

## System Requirements

- 
- One of the following personal computers:  
Macintosh SE/30, Macintosh II with a Paged Memory Management Unit (PMMU), Macintosh IIX, Macintosh IISI with a NuBus or 030 Direct Slot Adapter card, Macintosh IICX, Macintosh IICI, Macintosh II FX, Macintosh Quadra 700, Macintosh Quadra 900, and Macintosh Quadra 950
  - A minimum of 5MB RAM, 8MB recommended (MacX requires 8MB when running on A/UX)
  - An Apple hard drive or the equivalent (80MB minimum, 160MB recommended)
  - An Apple monitor, and video card if necessary (or an equivalent monitor compatible with A/UX 3.0)
  - Optional Apple Ethernet NB Card, on-board Ethernet, or an equivalent Ethernet card compatible with A/UX 3.0
  - An AppleCD SC drive or the equivalent (required to install A/UX 3.0 from the A/UX 3.0 CD-ROM)

## Quadra 900 & 950: Internal Hard Drives Must Not Be Terminated

Revised: 11/29/94  
Security: Everyone

Quadra 900 & 950: Internal Hard Drives Must Not Be Terminated

=====

Article Created: 11 November 1991  
Article Reviewed/Updated: 29 November 1994

TOPIC -----

Internal hard drives on the Quadra 900 & 950 must NOT be terminated. All Apple and third-party internal SCSI drives have terminating resistors that must be removed before installing in the Quadra 900 & 950.

DISCUSSION -----

If an internal hard drive is terminated, it will likely damage the Quadra 900 & 950's logic board. This occurs because the Quadra 900 & 950's logic board has active SCSI termination. If a SCSI device is installed with terminating resistors, it will overload the SCSI chip on the logic board and probably cause it to fail. Adding more SCSI devices will increase the load on the SCSI chip and make the failure more likely.

This situation is noted in the Technical Procedures for the Quadra 900 & 950 on pages 1.6 and 2.11.

## DAL Server for MVS/VTAM: Features & Benefits

Revised: 9/2/92  
Security: Everyone

DAL Server for MVS/VTAM: Features & Benefits

=====

Article Created: 11 November 1991

### Article Change History

-----

07/09/92 - REVIEWED

- For technical accuracy

### TOPIC -----

This article describes the Data Access Language (DAL) Server for MVS/VTAM.

### DISCUSSION -----

The DAL Server for MVS/VTAM is a multi-user server product that provides DAL access to IBM Database 2 (DB2) and Teradata DBC/1012 databases on an MVS host system. The DAL Server works cooperatively with personal computer applications that support DAL (such as spreadsheets, databases, and query tools running on Macintosh computers) while running under MVS, either directly through native VTAM or under CICS.

A complete connectivity setup for MVS includes a client personal computer running an application with embedded DAL support and an MVS host with the DAL Server. The DAL Server receives requests from the personal computer application, carries them out on MVS against DB2 or DBC/1012, and sends the desired data back to the application for desktop processing.

The DAL Server for MVS/VTAM provides uniform support for DAL-based applications. It works with existing DB2 and DBC/1012 databases, operating under standard MVS, DB2, and Teradata security. As a result, you receive transparent access to the data that you have authorization to access.

### Features

-----

- Operates as an MVS Batch Job either directly accessed through native VTAM

or a CICS Passthru connectivity

- Uniform support for DAL clients
- Asynchronous operation
- Incremental compiler implementation
- Trace facility
- Additional product, an interactive utility (IDAL) for testing DAL program statements
- Stored procedures
- Sample tables
- Support for Macintosh computers connected by way of Apple's Coax/Twinax, TokenTalk NB and Serial NB cards, Avatar's MacMainFrame, DCA's MacIRMA, TriData's Netway 1000/2000 products, Apple's SNA•ps APPC and 3270 Gateways as well as asynchronous dial-in to a protocol converter (supporting VT100 terminal type).
- Support for Macintosh computers connected asynchronously to a host computer with a compatible protocol converter installed

#### Benefits

-----

- Maintains the security and integrity of MVS, DB2, and Teradata systems.
- Allows one server to support all personal computers running DAL-compatible Macintosh applications.
- Once the connection is made, returns program control to the Macintosh so that the user can perform other tasks while the DAL Server carries out the requested operation on the host.
- Improves performance for repetitive requests.
- Reduces the client system processing load.
- Facilitates debugging and system tuning.
- Minimizes network traffic by storing commonly executed procedures on the host, where they can be shared.
- Makes developing and testing applications easier.
- Allows you to run applications on Macintosh computers regardless of the hardware connection to the host.

## DAL Developer's Toolkit for the Macintosh Descpt (Discontinued)

Revised: 10/17/96  
Security: Everyone

DAL Developer's Toolkit for the Macintosh Descpt (Discontinued)

=====

Article Created: 11 November 1991  
Article Reviewed/Updated: 17 October 1996

TOPIC -----

This article describes the Data Access Language (DAL) Developer's Toolkit for the Macintosh.

DISCUSSION -----

The DAL Developer's Toolkit for the Macintosh is a set of software components that helps programmers build Macintosh personal computer application programs with embedded access to host data. The resulting Macintosh applications give consistent, transparent access to shared corporate data when linked to a host system running the DAL Server.

These Macintosh applications use DAL, a high-level, SQL-based connectivity language. DAL allows Macintosh applications to access and interact with host data on a variety of minicomputer and mainframe systems in a uniform way, regardless of the particular host, operating system, database management system, or network connection. You develop all application programs on the Macintosh without expertise in host programming or particular host system.

The DAL Developer's Toolkit for the Macintosh is designed for Macintosh programmers, independent software vendors, and MIS departments designing Macintosh software. In a single development effort, Macintosh software developers can build products that address the need for host data access in a wide range of environments.

### Features

-----

- Documentation and sample application with C and Pascal call libraries
- Interactive utility for testing DAL program statements
- HyperTalk XCMD and XFNC commands for DAL access

- Host data retrieval into HyperCard fields, cards, and global variables
- DAL documentation in the form of a HyperCard Help stack
- DAL sample HyperCard stack with easily incorporated cut-and-paste buttons and cards
- Licensing provisions for distribution of DAL client software with Macintosh applications
- Seamless interaction between Macintosh applications, DAL client software, and DAL Server
- Resulting applications work with any DAL Server-equipped host
- DAL connectivity language
- ANSI standard level 1, SQL-based data manipulation language
- Integrated language that includes host connection, data manipulation, program control, and output management statements
- Application insulated from differences between Macintosh and host representation of byte order, character set, and floating-point data
- Application programming interface that resides in the Macintosh computer
- Uniform error codes, status messages, and catalog access across supported databases and system types

#### Benefits

-----

- Reduces startup time and ensures maximum productivity.
- Makes testing and debugging easier.
- Allows a debugged DAL program to be run without modification from within a Macintosh application.
- Provides complete DAL session control, program execution, and result retrieval from within a HyperCard stack.
- Allows the developer to access host data with the easy-to-use HyperCard interface.
- Allows the developer to become proficient quickly.
- Reduces stack-development time.
- Permits commercial and in-house developers to make host connectivity an integral part of their Macintosh applications.

- Allows users to enjoy easy access to host connectivity without needing to understand the underlying technology.
- Allows developers to serve various markets with a single programming effort.
- Facilitates the host connection process.
- Insulates Macintosh applications from the complexities of the particular host system, network, and data source to be accessed.
- Allows an application to work with any host system that supports DAL.
- Facilitates development of Macintosh applications by allowing programmers to provide access to a wide range of host environments in a single programming effort.
- Provides support of SQL query and update features.
- Provides uniform access to a wide range of data sources.
- Uses syntax that is familiar to many developers and users.
- Allows the Macintosh user to proceed with other work while the host request is carried out (once the server connection is complete).
- Is easily integrated into the scripting languages of many applications.
- Provides superior performance for repetitive requests.
- Allows for greater utilization of host processing power.
- Simplifies programming for the Macintosh developer.
- Allows all development to be accomplished on the Macintosh computer. Developers can provide host connectivity without investing in host hardware or acquiring host programming expertise.
- Allows applications accessing a wide variety of host system configurations to be created with a single programming effort.

## DAL Developer's Toolkit for Macintosh: Details & Requirements

Revised: 11/21/91  
Security: Everyone

DAL Developer's Toolkit for Macintosh: Details & Requirements

=====

Article Created: 11 November 1991  
Article Last Reviewed: 9 July 1992  
Article Last Updated: 9 July 1992

TOPIC -----

This article gives the product details, language specifications, and system requirements for the Data Access Language (DAL) Developer's Toolkit for the Macintosh.

DISCUSSION -----

### Product Details

-----

- Supplied Software
  - DAL device driver and driver installer
  - C and Pascal call libraries
  - Interactive DAL tester
  - Sample applications, including source code
  - DAL HyperCard XCMDs, including source code and sample stack
  - DAL documentation in HyperCard Help stack
- Network Support
  - Asynchronous communication, by way of direct or dial-up links
  - Support for the AppleTalk network system based on the AppleTalk Data Stream Protocol (ADSP)
  - Support for TCP/IP using Apple's MacTCP networking software
  - Support for the 3270 data streams and APPC (LU6.2) networking protocols
  - Support for connections to IBM hosts using Avatar's MacMainFrame, DCA's MacIRMA, and TriData's Netway 1000/2000 products
  - Asynchronous communication to IBM hosts equipped with protocol converters

### Language Specifications

-----

DAL is a complete language for describing connectivity tasks. It consists of these statement groups:

- Host Connection Statements  
These establish and terminate a connection to a host system in the network, providing concurrent access to multiple hosts running DAL Servers.
- Data Manipulation Statements  
These offer complete ANSI standard level 1, SQL-based data access to host databases.
- Program Structure Statements  
These support testing, looping, and procedure calls within a DAL program.
- Output Statements  
These generate output messages from the DAL program. The client application processes these messages.
- Execute Statement  
This permits execution of DBMS-specific commands not directly supported by DAL.

#### System Requirements

-----

To use the DAL Developer's Toolkit for the Macintosh, you need the following hardware and software:

- A Macintosh personal computer
- Macintosh system software version 6.0.5 or later
- The appropriate hardware and software for a supported network
- Access to a host computer with a DAL Server, and a database management system and networking software supported by DAL.

## DAL Server for MVS/VTAM: Details and System Requirements

Revised: 11/21/91  
Security: Everyone

DAL Server for MVS/VTAM: Details and System Requirements

=====

Article Created: 11 November 1991  
Article Last Reviewed: 9 July 1992  
Article Last Updated: 9 July 1992

TOPIC -----

This article gives the product details, language specifications, and system requirements for using the DAL Server for MVS/VTAM.

DISCUSSION -----

### Product Details

-----

- Database Support
  - Provides access to DB2 databases, version 1.3 or later
  - Provides access to Teradata DBC/1012 databases, version 4.1 or later
- Optional CICS Support

A CICS Passthru program runs as a standard CICS transaction program that provides optional CICS support.
- Client Support

Provides uniform support for any application developed with the DAL Developer's Toolkit for the Macintosh using a supported network.
- Network Support
  - Provides 3270 data-stream and APPC support. Allows SNA or non-SNA connection.
  - The client must have the supported 3270 hardware and software to emulate a 3278-type device or the supported hardware and software to do APPC communications:
    - MacDFT software and either the Apple Coax/Twinax Card, Apple Serial NB Card, or the Apple TokenTalk NB Card for the Macintosh II family of computers
    - Avatar's MacMainFrame, DCA's MacIRMA, and TriData's Netway 1000/2000

connectivity products

- Asynchronous support to hosts equipped with an appropriate protocol converter
  - APPC (LU6.2) support via Apple's SNA•ps Gateway
- 
- Resource Usage
    - 1MB of disk storage
    - 8MB of address space recommended
    - Test program verifies correct installation and usage

#### Language Specifications

-----

DAL is a complete language for describing connectivity tasks. DAL consists of these statement groups:

- Host Connection Statements  
These establish and terminate a connection to a host system in the network, providing concurrent access to multiple hosts running DAL Servers.
- Data Manipulation Statements  
These offer complete ANSI standard level 1, SQL-based data access to host databases and files.
- Program Structure Statements  
These support testing, looping, and procedure calls within a DAL program.
- Output Statements  
These generate output messages from the DAL program. The client application processes these messages.

#### System Requirements

-----

To use the DAL Server for MVS/VTAM, you need the following software and hardware:

- Host Environment
  - MVS/XA version 2.2 or later, or MVS/ESA version 1.0 or later running VTAM version 3.1 or later.
  - For the CICS Passthru Program, CICS 1.7 or later with LU6.2 support is required.
  - DB2 version 1.3 or later.
  - Teradata DBC/1012 version 4.1 or later.
- Macintosh computer clients running DAL-compatible applications
- Appropriate networking hardware and software

## Data Access Language Server for VAX/VMS: Features & Benefits

Revised: 6/29/92  
Security: Everyone

Data Access Language Server for VAX/VMS: Features & Benefits

=====

Article Created: 11 November 1991  
Article Last Reviewed: 29 June 1992  
Article Last Updated: 29 June 1992

TOPIC -----

This article describes the Data Access Language (DAL) Server for VAX/VMS.

DISCUSSION -----

The DAL Server for VAX/VMS is a networking software product that provides DAL access to files and databases on a VAX/VMS host system. The DAL Server runs on a VAX/VMS host and works cooperatively with personal computer applications that support DAL, such as spreadsheets, databases, and query tools on Macintosh computers.

A complete connectivity setup for VAX/VMS includes a client personal computer running an application with embedded DAL support, and a VAX/VMS host with the DAL Server. The DAL Server receives requests from the personal computer application, carries them out on the VAX, and sends the desired data back to the application for local processing.

The DAL Server for VAX/VMS provides uniform support for DAL-based applications, through a variety of network configurations and VAX/VMS data management software. It works with existing VAX/VMS databases, operating under standard VMS and database security. Your Macintosh computer receives transparent access to the VAX data you are authorized to access.

### Features

-----

- Server operates as a user process under standard VMS user name/password security
- Uniform support for DAL clients

- Uniform concurrent support for VAX databases
- Standard VAX/VMS installation procedures
- Asynchronous operation, after connection is established.
- Incremental compiler implementation
- Trace facility
- Interactive utility for testing DAL program statements
- Stored procedures
- Sample tables
- Wide range of commercial applications with DAL connectivity available

#### Benefits

-----

- Maintains the security and integrity of VAX/VMS and the database management system.
- Eliminates the need for new system administration procedures on the VAX.
- Allows one server to support all Macintosh computers running DAL-compatible applications.
- Insulates personal computer applications from the complexities of the database used.
- Supports multivendor environments.
- Makes installation quick and easy.
- Returns program control to the Macintosh so the user can perform other tasks while the DAL Server carries out the requested operation on the host.
- Reduces the client system processing load.
- Facilitates debugging and system tuning.
- IDAL ensures proper connection, installation, and operation of host server.
- Minimizes network traffic by storing commonly located procedures on the host, where they can be shared.
- Makes developing and testing applications easier.
- Provides spreadsheet, query tool, and mapping tool users with seamless host data integration with no programming effort.

Article Last Updated: 29 June 1992

TOPIC -----

This article gives the product details, language specifications, and system requirement for using Data Access Language (DAL) Server for VAX/VMS.

DISCUSSION -----

### Product Details

-----

- Database Support
  - Informix version 2.1 (or later)
  - Ingres version 6.1 (or later)
  - Oracle version 5.1.22 (or later)
  - Oracle version 6.0
  - Rdb/SQL version 3.1 (or later)
  - Sybase SQL Server version 3.0 (or later)
- Client Support
  - Uniform support for any application developed with DAL Developer's Toolkit for the Macintosh using a supported network
- Network Support
  - Asynchronous direct and dial-up connections
  - Support for the AppleTalk network system (requires AppleTalk for VMS version 2.0.6 or later for Phase I and version 2.1 for Phase II), which is supplied with DAL Server for VAX/VMS.
- Asynchronous Communications
  - Transmission speed: 300 to 19,200 baud
  - Character length: 7 or 8 data bits; 1 or 2 stop bits
  - Parity: odd, even, or none

- Handshake
  - XON/XOFF and none
  - Modem and direct connections
  - Log-on sequence specification
- Protocol
  - Error-correcting (16-bit CRC)
  - Data compression
  - Binary data transparency
- Resource Usage
  - 1MB of disk storage
  - Proper usage verified by test program
  - One sharable, reentrant 200K-300K process shared by all attached Macintosh applications

#### Language Specifications

-----

DAL is a complete language for describing connectivity tasks. DAL consists of these statement groups:

- Host Connection Statements

These establish and terminate a connection to a host system in the network, providing concurrent access to multiple hosts running DAL Servers.
- Data Manipulation Statements

These offer complete ANSI standard level 1, SQL-based data access to host databases.
- Program Structure Statements

These support testing, looping, and procedure calls within a DAL program.
- Output Statements

These generate output messages from the DAL program. The Client application processes these messages.

#### System Requirements

-----

To use the DAL Server for VAX/VMS, you need the following:

- Host environment: VAX/VMS version 5.1 (or later)
- Macintosh computer clients running DAL-compatible applications
- One or more of the supported database management systems
- The appropriate networking hardware and software

## PowerBook: Which Models Support SCSI Disk Mode (9/96)

Revised: 9/17/96  
Security: Everyone

PowerBook: Which Models Support SCSI Disk Mode (9/96)

=====

Article Created: 29 October 1991  
Article Reviewed/Updated: 17 September 1996

TOPIC -----

Which PowerBook models allow mounting of the PowerBook computer's internal hard drive as a Small Computer Systems Interface (SCSI) device on the SCSI chain of a desktop Macintosh computer, also called SCSI Disk Mode?

DISCUSSION -----

PowerBook Models Using SCSI Disk Mode

-----

The SCSI Disk Mode feature exists on all PowerBook models except the PowerBook 140, 145, 145B, 150, and 170. Those PowerBook computers that DO support the feature have it coded into their read-only memory (ROM) on the logic board.

PowerBook Models Using HD Target Mode

-----

When you are using a PowerBook 190 or 5300 series computer, this disk mode function is no longer called SCSI Disk Mode. It is called HD Target Mode because these PowerBook models have an integrated drive electronics (IDE) hard drive, not a SCSI hard drive. Although the terminology is different, the function is the same.

Which SCSI Cable?

-----

You must use the appropriate SCSI cable for SCSI Disk Mode. The part number for the Apple HDI-30 Disk Adapter cable is M2539LL/A.

You can distinguish the Disk Adapter cable from a standard PowerBook SCSI cable by looking at the number of pins in the connector on the end of the cable that plugs into the PowerBook.

\* The Apple HDI-30 Disk Adapter (M2539LL/A) cable's connector has 30 pins. It is the thirtieth pin that puts the computer into SCSI Disk or HD Target Mode.

\* The Apple HDI-30 SCSI System (M2538LL/A) cable's connector has 29 pins. It is used to connect external SCSI devices, like CD-ROMs and hard drives, to your PowerBook computer.

#### What About PowerBook Duo Computers?

For the PowerBook 200 and 2300 Series (Duo) computers, you must use the Apple HDI-30 Disk Adapter cable in addition to the Duo MiniDock to enable the Duo to be used in SCSI Disk Mode.

**\*\*NOTE\*\*** The Duo Dock, Duo Dock II, and Duo Dock Plus do not support SCSI Disk Mode. When a PowerBook Duo computer is docked (except for the MiniDock) its SCSI capabilities are the same as any other desktop Macintosh computer, none of which support any kind of SCSI Disk or Target mode function.

This article was published in the Information Alley on 17 September 1996.

## PowerBook: International Travel & Overseas Purchase (11/94)

Revised: 11/30/94  
Security: Everyone

PowerBook: International Travel & Overseas Purchase (11/94)

=====  
Article Created: 4 November 1991  
Article Reviewed/Updated: 30 November 1994

TOPIC -----

What are the legal requirements for travelling with PowerBook computers internationally? What do you advise to avoid damaging the unit and/or voiding the warranty?

What government regulations do I need to be aware of for units purchased overseas (in particular Europe and the Far East), and brought into the U.S.?

DISCUSSION -----

There are export restrictions on PowerBook computers. You should contact the local U.S. Customs Department to find out what paperwork you'll need to export and import the equipment. If the value of the equipment is over \$2500, you also need to contact the local Department of Commerce and obtain a Shipper's Invoice.

You should not check the unit with luggage. If you must check it, use the original box. To avoid damage while travelling, a well padded and durable case should be used to transport the PowerBook. Be sure the battery is charged to demonstrate that the unit is functional.

Apple has a global warranty so that products purchased in or out of the United States can be repaired at any Apple authorized service provider. Be aware that parts availability may be limited and as a consequence, repair times may be extended while out of the country of original purchase. Be sure to have your proof of purchase with you when travelling overseas to validate warranty coverage.

## PowerBook & Macintosh Classic II: No Support for System 6

Revised: 11/30/94  
Security: Everyone

PowerBook & Macintosh Classic II: No Support for System 6

=====

Article Created: 4 November 1991  
Article Reviewed/Updated: 29 November 1994

TOPIC -----

Does system software version 6.0.7 work on the Macintosh Classic II and the Macintosh PowerBook? If not, why not?

DISCUSSION -----

The Macintosh PowerBook models and the Macintosh Classic II DON'T SUPPORT system software version 6.0.7 or version 6.0.8.

The software may work on the Macintosh PowerBook 100, but the backlit screen support, battery DA, and Low Power Dialogs won't work. The PowerBook 140 and 170 don't support System 6.0.x due to the newer ROM and other modifications in those systems.

The Macintosh Classic II has a different processor, and applications may have problems due to the different processor. You may not be able to install or start up with version 6.0.7 or 6.0.8 on the Macintosh Classic II.

Apple Computer won't answer questions based on problems associated with running system software versions 6.0.7 or 6.0.8 on any of these computers.

## Macintosh Quadra 700 and 900: Answers to Common Qs (11/94)

Revised: 12/2/94  
Security: Everyone

Macintosh Quadra 700 and 900: Answers to Common Qs (11/94)

Article Created: 24 October 1991  
Article Reviewed/Updated: 29 November 1994

TOPIC -----

This article answers common questions about the Quadra 700 and 900 computers.

DISCUSSION -----

- Q. Can the key position be sensed through software?  
A. There is no way to detect the key position through software.
- Q. Why didn't Apple use the IIcx RAM? Don't the latched writes speed up the CPU?  
A. Apple didn't use the IIcx RAM on the Quadras because it wasn't necessary. The writes are "latched" on the 68040 itself, so we didn't need to do it externally. In other words, if the 68040 needs to do a read and a write at the same time, it will do the read first (since it needs to read data to continue). It saves the write data until the read is done, and then it will write.
- Q. How can we get the physical Ethernet address of built-in Ethernet?  
A. The Ethernet address is not available via system call.
- Q. What is the speed of VRAM?  
A. The minimum speed of the VRAM is 100ns, but Apple's upgrade package will be 80ns to assure future compatibility.
- Q. Does Apple support 24-bit mode on the 21-inch Color Display? A. When we designed the frame buffer controller, the 256K VRAM SIMMs were the only SIMMs Apple was using (in the Display Card 8•24). The design goal was to use 4 banks of VRAM so that we could do "four-way-bank- interleaving." This is a method for getting the data out of the four banks in a staggered fashion, since no single bank could provide data fast enough to refresh most monitors at higher bit depths.

If we used larger densities of VRAM (that is, 512K), we still couldn't obtain 24-bit on the 21-inch display because the video driver chip (RAM-DAC aka AC/DC) could not support the clock speeds required to do 24-bits on a 21-inch monitor. This would require a much more expensive RAM-DAC. We would have to use 64-bit data paths in the frame buffer, which would have been prohibitively expensive for a main logic board solution.

Q. Does Apple's Display Card 8•24 support the 21-inch Color Display in 24-bit?

A. The Macintosh Display Card 8•24 doesn't support the 21-inch Color Display at 24-bit (2MB is not enough). The RasterOps 24-bit card provides a third-party solution.

Q. Is the 21-inch Color Display supported by the on-board video on the Macintosh IIfx, IIsi, or LC?

A. The 21-inch Color Display isn't supported by the on-board video on the Macintosh IIfx, IIsi or LC.

Q. Is the AppleCD SC drive supported internally by the Quadra?

A. The older AppleCD SC drive is not supported internally by the Quadra 900.

Q. What is a Pseudo Block transfer?

A. The term "Pseudo Block transfer" is really a 68040 term that indicates what type of system bus cycle we run when a Move16 instruction moves data to/from a NuBus board. Developers should use Move16 in their I/O drivers for higher throughput.

Q. Is the Symantec compiler compatible with the 68040 CPU?

A. Version 5.0 of the Symantec compiler is compatible with the 68040 CPU.

Q. Why isn't there 16-bit monitor support on the internal video as on the Macintosh LC?

A. We don't have 16-bit monitor support because the CLUT-DAC chip we use to generate the video control signals doesn't have a 16-bit mode. We couldn't use the CLUT-DAC chip from the LC because our video operates at higher frequencies (up to 100 MHz), which weren't supported by the LC CLUT-DAC.

Macintosh Quadra: AppleTalk Phase II Only (10/91)

Article Created: 31 October 1991  
Article Reviewed/Updated: 29 November 1994

### TOPIC -----

I tested a Macintosh Quadra 900 on an AppleTalk Phase 1 network. When I selected the Phase 1 icon under the network icon, I got the message "an error has occurred using LocalTalk."

Is AppleTalk Phase 1 not supported on the Quadra on-board Ethernet?

### DISCUSSION -----

Ethernet on all Macintosh Quadra computers is Phase II only.

## A/UX 3.0: Multiple Macintosh Partitions (11/94)

Revised: 11/29/94  
Security: Everyone

A/UX 3.0: Multiple Macintosh Partitions (11/94)

Article Created: 29 October 1991  
Article Reviewed/Updated: 29 November 1994

TOPIC -----

Will A/UX 3.0 support multiple Macintosh partitions on the same hard drive with Apple HD SC Setup?

DISCUSSION -----

If a disk is set up with multiple Macintosh partitions, A/UX 3.0 will mount them all. However, A/UX doesn't include a tool to create them. Apple HD SC Setup will still be limited to creating only one Macintosh partition per disk. Third party utilities that support UFS and HFS file systems can create multiple Macintosh partitions.

## Ethernet NB Card: Cables, Connections, Termination (11/94)

Revised: 11/29/94  
Security: Everyone

Ethernet NB Card: Cables, Connections, Termination (11/94)

=====

Article Created: 17 October 1991  
Article Reviewed/Updated: 29 November 1994

TOPIC -----

We have the following questions about the Ethernet NB Card, regarding termination and compatibility:

- 1) Regarding the Ethernet NB Card and thin coax cable, is the termination supplied by the Apple Ethernet Thin Coax Transceiver, or the Apple Ethernet 5/13-meter cable, or both?
- 2) Would the new self-terminating thin coax cable work if connected to the older EtherTalk NB card (various revs) with a T connector? If so, would a terminator on the T be necessary?
- 3) Regarding question 2, what if we wish to connect the old card to a new card/CPU with built-in AAUI port? How can the two different cards/ports be connected using the new thin or thick coax cabling/transceivers? Would they need to use standard coax cable or can they use the Apple cable?

Example: We want to connect a Macintosh IIIfx with a Rev. M EtherTalk NB card to a Quadra 900, with built-in Ethernet. We now must connect the Rev. M card with a T connector to the AAUI thin coax transceiver on the Quadra 900. Are the cards compatible or is it the cabling?

- 4) Will the Synoptics concentrators support Apple Ethernet NB cards?
- 5) Will the current network configuration allow us to use the Apple LaserWriter IIg directly from the RJ-45 ports?

DISCUSSION -----

- 1) Both the Apple Ethernet Thin Coax Transceiver and the Apple Ethernet 5/13-meter cables have the ability to supply termination. In regard to

the Apple Ethernet Thin Coax Transceiver, there are two BNC connectors on the transceiver. If a cable isn't attached to one or both of these BNC connectors, termination is applied. When cables (any cables, Apple or non-Apple) are attached to both connectors, termination is not applied.

The Apple Ethernet 5-meter Thin Coax Cable and Apple Ethernet 13-meter Plenum Cable have terminators at each end of the cables. When nothing is attached at either end of the cable, termination is applied at the end of the cable where nothing is attached.

- 2) Yes, but the Apple Ethernet 5-meter Thin Coax Cable and Apple Ethernet 13-meter Plenum Cable are only self-terminating when an end is not connected to anything. If you are using an EtherTalk NB Card at the end of a network, the T connector will either need a terminator on the open end, or one of the self-terminating Apple cables attached with nothing connected at the other end of the cable.
- 3) There is no problem using non-Apple thin coax cable with the Apple Ethernet Thin Coax Transceiver, nor is there a problem using Apple Thin Coax Cable with the EtherTalk NB Card. The Apple Ethernet NB Card and AppleTalk NB Cards can be intermixed on a network with no problems.
- 4) Yes. The only caveat here is that the Synoptics concentrators must have a 10BaseT compatible card installed (Synoptics LatticeNet 3308 10Base-T Host Card, for example).
- 5) Yes, if the RJ-45 port is wired into a 10BaseT compatible host card (Synoptics LatticeNet 3308 10Base-T Host Card, for example).

## Macintosh Classic: US/Japan Systems Are 110V Only 10/91

Revised: 11/30/94  
Security: Everyone

Macintosh Classic: US/Japan Systems Are 110V Only 10/91

=====

Article Created: 30 October 1991  
Article Reviewed/Updated: 29 November 1994

TOPIC -----

I have a Macintosh Classic, and on the Power/Sweep-Board (805-0948-A) is a jumper that says 110/220 Volts. Is it simple to change to 220 Volts, 50 Hz for International use?

DISCUSSION -----

The power supply for the US/Japan Macintosh Classic is 110V only. It cannot be switched to 220V. The power supply for the International Macintosh Classic is 220V only. There are different components installed on each power supply.

Modifying the power supply by changing the JP1 jumper to work within a different voltage is definitely not recommended and will void the warranty.

## Apple Ethernet NB Card: 16-bit Bus Path and Tasks (10/91)

Revised: 11/29/94  
Security: Everyone

Apple Ethernet NB Card: 16-bit Bus Path and Tasks (10/91)

Article Created: 25 October 1991  
Article Reviewed/Updated: 29 November 1994

TOPIC -----

I'm a developer with two questions about the Apple Ethernet NB card.

- 1) How many data bits does the card work with internally: 8, 16 or 32?
- 2) What is the use of the 68000 processor when using EtherTalk or MacTCP?  
Does any of that code run on A/ROSE and does it make the data transfer faster?

DISCUSSION -----

- 1) The Apple Ethernet NB card has a 16-bit bus, and is comparable in performance to the older EtherTalk NB card.
- 2) Very few tasks are downloaded to the card (nothing on top of A/ROSE).  
So the on board 68010 mostly manages the DMA, off-loading little of the cycles and work required of the Macintosh's main logic board processor.

Incidentally, the SONIC chip used in the Ethernet NB card is 32-bit capable, and when used in Quadra systems is in 32-bit mode.

## A/UX: terminfo Decompile (11/94)

Revised: 11/29/94  
Security: Everyone

A/UX: terminfo Decompile (11/94)

Article Created: 18 October 1991  
Article Reviewed/Updated: 29 November 1994

TOPIC -----

Is there a terminal description decompiler available for terminfo?

I need to add a new terminal description for terminfo that is similar to what is already in the database. Is there a decompiler that will allow me to make small changes to an existing terminal type, without having to deduce the entire set of operating parameters?

DISCUSSION -----

Public domain software called "untic" can "decompile" a terminfo description file. The README file and untic.1 manual page provide more information.

You can find public domain software from the usual sources, such as user groups.

These articles can help you locate software updates mentioned here:

- Where To Find Apple Software Updates  
Lists online services for "free" Apple software updates
- Obtaining Apple Product Support in the USA  
Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech. Info. Library

Apple doesn't provide support for this software.

## Macintosh HFS: Technical Documentation Available (10/91)

Revised: 11/29/94  
Security: Everyone

Macintosh HFS: Technical Documentation Available (10/91)

=====

Article Created: 18 October 1991  
Article Reviewed/Updated: 29 November 1994

TOPIC -----

I want to write a driver to allow the CD-ROM drive on my UNIX machine to read Macintosh HFS CDs. Is there any Apple documentation that describes HFS from the programmer's perspective?

DISCUSSION -----

The detailed information of Macintosh HFS (Hierarchical File System) is described in "Inside Macintosh, Volume IV," pages 89 - 212 (The File Manager).

The following Macintosh Technical Notes relating to HFS might be useful:

- TN 44 - HFS Compatibility
- TN 66 - Determine Which File System Is Active
- TN 68 - Searching All Directories on an HFS Volume
- TN 77 - HFS Ruminations

You can request the Macintosh Technical Notes from APDA.

Also, the "Technical Introduction to the Macintosh Family" documentation page 155 has information on the overview of HFS.

## A/UX: Disabling AppleTalk for Serial ImageWriter Connection

Revised: 9/30/92  
Security: Everyone

A/UX: Disabling AppleTalk for Serial ImageWriter Connection

=====

Article Created: 22 October 1991

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

We want to use a serial ImageWriter under A/UX. We don't have any network printer, and want to connect it on the printer port. To enable this, we reconfigured our kernel (newconfig noappletalk) to remove the AppleTalk connection on the printer port and then restarted to make this change effective.

After restarting, we opened the Chooser DA, and noticed that AppleTalk was still active. We selected the ImageWriter icon, and got the choice between Printer and Modem ports in the right window. As we selected Printer, we got a dialog box saying that AppleTalk will be disconnected. We chose OK and got the usual window reminding us to change the page setup. However, when this dialog box closed, the selected port was still Modem and not Printer.

Fortunately, we can still use the Modem port, even without disabling AppleTalk. Is there a way to disable AppleTalk on the printer port?

### DISCUSSION -----

Yes, you can disable AppleTalk on either the Printer port or the Modem port by doing:

```
# appletalk -d
```

ONLY the Modem port can be used as the Chooser style of printing method

from the MultiFinder environment. The Printer port DOESN'T work in A/UX 2.0.1. This applies to both direct serial line and direct LocalTalk line connection.

## A/UX: Printing Large Files with lpr (9/94)

Revised: 9/9/94  
Security: Everyone

A/UX: Printing Large Files with "lpr" (9/94)

=====

Article Created: 25 October 1991  
Article Reviewed/Updated: 9 September 1994

TOPIC -----

Is there a way to print files that are greater than 1MB using "lpr"? The manual entry says that "If you try to spool too large a file, it will be truncated."

After printing approximately 200 or so pages of a 400-page report, the file is truncated. This works out to about a 1MB limit on lpr. Do you have any suggestions on how we can run the whole file through the printer?

DISCUSSION -----

The default maximum file size printed via Berkeley "lpr" printer spooler under A/UX is 1000 blocks (1K/block) which is about 1MB.

However, this default limitation can be changed via the printcap entry called "mx" specified in the /etc/printcap database file. You may use the 0 value for the unlimited file size printing (for example, mx#0). Refer to the man pages for further details.

## A/UX: Maximum Address Space per Process (8/94)

Revised: 8/30/94  
Security: Everyone

A/UX: Maximum Address Space per Process (8/94)

=====

Article Created: 29 October 1991  
Article Reviewed/Updated: 30 Aug 1994

TOPIC -----

I'm running A/UX on a Macintosh IIx with 32MB of RAM. When running a test program, it appeared that one process can allocate a maximum of 28MB, although several processes together can allocate the maximum available virtual memory (32MB swap + 13MB internal memory available). Is there a way to increase the limit of 28MB?

DISCUSSION -----

We aren't sure how the "test program" came out with a maximum of 28MB address space allocated to one process. What kind of method did the tested program allocate for memory, via `sbrk()`, `malloc()`, `calloc()` or other system calls?

The maximum user address space for process is by default 40,000 pages, which is about 1GB. The kernel parameter for the maximum user address space is `MAXUMEM`, shown via "`kconfig -av.`" Although it can be up to 1GB, it still depends on how much swap space and physical memory is currently available. One way to increase to the address space limit for a process is to increase swap space (`swap -a`)!

Note that the `MINASMEM` (the minimum number of 10 pages reserved for the system to avoid deadlock) must be taken into consideration when calculating the current available swap disk space and resident memory.

## A/UX: Printing Garbage When Starting A/UX (9/94)

Revised: 9/9/94  
Security: Everyone

A/UX: Printing Garbage When Starting A/UX (9/94)

=====

Article Created: 29 October 1991  
Article Reviewed/Updated: 8 September 1994

TOPIC -----

I am running A/UX 3.0 on a Macintosh IIfx with 32MB of RAM. We have serially connected a line printer, using the "lp" system. The printer works, but when we start A/UX, the computer sends a lot of garbage to the printer. This continues until we turn off the printer. What causes this, and how can we avoid it?

DISCUSSION -----

Perhaps you had AppleTalk/LocalTalk printing configured before, and used either the modem (tty0) or print (tty1) port. Also, some unfinished print jobs left in the spooler might print out this way. Go to the /usr/spool/lp directory and check for anything left in the print queue.

Here are some other things you might want to check:

- Is the printer port (tty0 or tty1) getty disabled in the /etc/inittab file?
- Use the "ps -ef" command to display all processes that might introduce the problem.
- Is the 'lp' or 'lpd' daemon functioning properly?

## A/UX: can't create lower memory segment Error (9/94)

Revised: 9/21/94  
Security: Everyone

A/UX: "can't create lower memory segment" Error (9/94)

=====

Article Created: 8 November 1991  
Article Reviewed/Updated: 21 September 1994

TOPIC -----

After starting the A/UX system and the Login process, the Finder emulation starts, but the Command Shell doesn't. Meanwhile a message appears somewhere on the screen saying: "can't create lower memory segment". This is an intermittent error that appears three or four times a day.

DISCUSSION -----

The "can't create lower memory segment" error message might be displayed because the system has temporarily exhausted its available physical memory or swap space, or the number of shared memory segments attached to the calling process exceeds the system-imposed limit. This usually happens while trying to start up the Macintosh environment executed by the "startmac" process. Check your available memory and swap space to see if this is the case.

Macintosh: the Clipboard Uses Application's Memory Partition

=====

Article Created: 25 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have a 600K SoundEdit file open. When I try to copy and paste it, I get the message that there isn't enough memory.

What is the maximum amount of RAM that can be allocated to the Clipboard?

DISCUSSION -----

When data is copied to the Clipboard, the information is stored in the APPLICATION program's memory partition. (If you open "About this Macintosh," you can watch the amount of memory that is used up in the application's partition increase when it's trying to copy something.) The out of memory message tells you there isn't enough memory available in that application's partition to copy that information to the Clipboard.

SoundEdit defaults to about 1024K. Assuming that the partition size for SoundEdit is 1024K, if you have a 600K sound file open, plus the amount of memory required to launch the application, you would not have another 600K available to copy that sound into the Clipboard.

With SoundEdit set at 1024, we found there wasn't enough memory to copy a 437K sound file into the Clipboard. After quitting SoundEdit and increasing the partition size to 2024, we launched SoundEdit again, opened the same sound, and copied it to the Clipboard.

## **IOLink Controls Apple IIC Bus Components from a Macintosh**

Revised: 11/21/91  
Security: Everyone

IOLink Controls Apple IIC Bus Components from a Macintosh

=====

Article Created: 23 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

A new product, called IOLink, that controls Apple IIC bus components from a Macintosh computer is now available from Hamlin Technical. Apple IIC is a serial bus standard developed by Philips/Signetics that allows all circuits within a system to communicate bidirectionally with each other. Apple IIC compatible components are available from a number of manufacturers.

DISCUSSION -----

IOLink offers engineers and technicians a way to control all sorts of circuits on the workbench; for example, analog input and output, parallel I/O ports, high-current solenoid drivers, video and audio circuits. IOLink runs on any Macintosh and consists of a hardware interface and either a stand-alone application or HyperCard XCMD.

The IOLink products are a solution in almost any moderate speed I/O application for the Macintosh where plug-in cards or RS-422 controllers were used. Apple IIC bus developers can test and debug their products from either the IOLink application program or HyperCard.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

## Personal LaserWriter: Why No Page Counter

Revised: 11/21/91  
Security: Everyone

Personal LaserWriter: Why No Page Counter

=====

Article Created: 23 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Is there any way to find out how many sides of paper a Personal LaserWriter SC has printed in its lifetime?

DISCUSSION -----

There is nothing built into the Personal LaserWriter engine that counts printed pages. A mechanical counter would add cost and be vulnerable to tampering. An electronic counter would require additional logic that may not otherwise be present.

About the only laser printers with a page counter are those with a built-in PostScript interpreter. Implementing one on a PostScript controller is relatively trivial, because the requisite logic is already in place. The count is usually used to determine mechanism wear.

## LaserWriter: Thinnest Possible Lines

Revised: 11/21/91  
Security: Everyone

LaserWriter: Thinnest Possible Lines

=====

Article Created: 1 November 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

What is the minimum line width that a Personal LaserWriter NT can print (in millimeters and points)? Is this the same for all LaserWriter printers?

DISCUSSION -----

The thinnest line a LaserWriter can print is limited by what's known as a device pixel. With all LaserWriter models to date, including the Personal LaserWriter (using the Canon P-110 engine), a device pixel is 1/300 of an inch, or .08mm. This translates to 24/100, or roughly one quarter of a point.

Many programs won't actually display a line this narrow, and instead use one point as their smallest printable unit. This PostScript code will generate an example page with a matrix of lines, each a single device pixel thick:

```
0 setlinewidth
72 72 612 {dup 0 moveto 792 lineto stroke} for
72 72 792 {dup 0 exch moveto 612 exch lineto stroke} for
showpage
```

Use a PostScript dump utility to download this program. This feature is available in version 7 of the LaserWriter Font Utility, or one of the old standbys like PSDump or Widgets.

## DAL and TCP/IP Support for VAX, IBM, and UNIX Hosts

Revised: 7/15/92  
Security: Everyone

DAL and TCP/IP Support for VAX, IBM, and UNIX Hosts

=====

Article Created: 17 October 1991  
Article Last Reviewed: 9 July 1992  
Article Last Updated: 9 July 1992

TOPIC -----

I'm using System 7 on a Macintosh II-class computer. I have some DAL questions:

- 1) Does DAL for VMS, or DAL for MVS, support TCP/IP from the workstation?  
In other words, can I log on to a VAX or IBM host from a Macintosh using Data Access Language and TCP/IP protocol?
- 2) Do any of the front-end DAL products (ClearAccess, Brio, GQL) support TCP/IP protocol for doing the DAL/SQL queries?
- 3) Any idea who might have a DAL for UNIX product?

DISCUSSION -----

- 1) Neither DAL for VMS nor DAL for MVS support TCP/IP connections. The only DAL servers that support TCP/IP connections are DAL Server for VM and DAL Server for A/UX.

With DAL 1.3, you can log on to a VAX using the following DAL connections:

- ADSP
- ADSP toll (with Comm Toolbox tool)
- Asynchronous
- Async CTB (with Comm Toolbox tool)

With DAL 1.3, you can log on to an IBM MVS host using the following connections:

- MacDFT Coax/Twinax card connection
- MacDFT TokenTalk NB Card connection - not in System 7
- MacDFT Serial NB Card connection - not in System 7
- MacIrma connection
- MacIrma HLLAPI connection
- MacMainFrame connection
- NetWay 1000/2000 connection
- Protocol Converter connection
- SNA•ps APPC connection - as of release 1.3.5 of FAL, SNA•ps 3270 connection.

2) If DAL Server and Client support the connections between the client workstation and the host, the applications will work without any changes.

3) APDA offers a product for DAL support for TCP/IP connections to VM and to develop for UNIX hosts. Pacer software licenced DAL to develop for UNIX hosts, and are now shipping some UNIX DAL servers. For more information, please contact Pacer directly.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

## PATHWORKS: Using With Wollongong's TCP/IP

Revised: 1/21/92  
Security: Everyone

PATHWORKS: Using With Wollongong's TCP/IP

=====

Article Created: 17 October 1991  
Article Last Reviewed:  
Article Last Updated:

### TOPIC -----

We would like to run PATHWORKS on our VAX systems. However, we are entirely based on TCP/IP and don't run DECnet at all. We are using TCP Connect II on Macintosh computers.

The other difficulty is that we don't use DEC's TCP/IP, but rather, Wollongong's TCP/IP.

Will this work?

### DISCUSSION -----

PATHWORKS for Macintosh is a Digital product. It is sold and supported by Digital. The official line from Digital is that they only support their version of TCP/IP.

You won't be able to get all the components to work if you don't allow DECnet protocols, since most of them rely on DECnet. The most common thing people use TCP/IP for is MacX and DECwindows; if you use another package, you need to make some adjustments for this to work. For instance, you will have to log on to the VAX via Telenet, and under VMS, create a display for DECwindows with the \$ SET DISPLAY command. You will have to know what parameter to specify for /TRANSPORT because the keyword TCPIP is reserved for the Digital TCP package. After you successfully create the display, you may use the \$ SPAWN or \$ RUN/DETACH command to execute the DECwindows client over the display.

The bottom line is that you will have to work with both Digital and Wollongong to get the correct syntax for different operations. If you are very interested in running PATHWORKS in this environment, we suggest you

discuss the situation with the Digital Account Rep for an official Digital solution.

## PATHWORKS: Printing Option-Key Characters (11/94)

Revised: 11/11/94  
Security: Everyone

PATHWORKS: Printing Option-Key Characters (11/94)

=====

Article Created: 23 October 1991  
Article Reviewed/Updated: 11 November 1994

TOPIC -----

When printing any letter or character produced by an option-key combination, like the • (Option-8) character, the result is garbage -- regardless of the font/software package used on the Macintosh. I think the eighth bit is being dropped from the datastream somewhere between the Macintosh and the printer.

Here is the configuration:

- DEC VAX running PATHWORKS 1.0 and GrayMatter Print Spooling Software
- Macintosh Workstations running System 7
- QMS PS-810 Laser Printers
- MMac/8 Serial-to-Ethernet Cable Routers connecting the QMS serially to the router, then Ethernet from the router to the VAX.

DISCUSSION -----

We printed a MacWrite document, with a number of Option-key-combination characters, to an Apple LaserWriter via the PATHWORKS 1.0 VAXshare Print Services with no problem.

We aren't really clear how GrayMatter Print Spooling Software fits into this picture, because PATHWORKS for Macintosh comes with the VAXshare Print Service. It would be helpful to know if you're printing from a Macintosh to the VAXshare Print Spooler or from the GrayMatter Print Spooler.

At any rate, the official statement from Digital for PATHWORKS 1.0 is that it only supports the following Digital and Apple printers:

- Digital: LPS20, LPS40, LPS40 Plus, LN03R
- Apple: LaserWriter, LaserWriter Plus, LaserWriter IINT and IINTX

Serially connected printers might have a problem with the default settings of

7-bit mode. To print the Option-key-combination characters, you'll need to set it to 8-bit mode.

To set the printer to 8-bit mode, print the following two files:

```
msap$set_params.ps  
msap$show_params.ps
```

in the PATHWORKS directory: msa\$root:[msa.msap\$utility]

The second file prints a confirmation sheet on the printer.

If the above suggestion doesn't work, we strongly suggest that you contact the Digital Customer Support Center. They might know of problems associated with third-party printers and PATHWORKS, and might already have a patch for it in their database.

## AppleShare 3.0: Memory and Apple II Limits (11/94)

Revised: 11/11/94  
Security: Everyone

AppleShare 3.0: Memory and Apple II Limits (11/94)

=====

Article Created: 18 October 1991  
Article Reviewed/Updated: 11 November 1994

TOPIC -----

- 1) To run under System 7, AppleShare 3.0 needs 4MB RAM. Does this include having the Print Serving option running as well?
- 2) Is 5MB enough to run AFS 3.0, APS 3.0, AppleTalk Internet Router and support for Apple II users?
- 3) I saw something on a limitation of 20 some Apple II users -- is this a simultaneous log-on limit, or can I assign only 20 users the ability to log on from an Apple II?

DISCUSSION -----

- 1) The 4MB requirement for AppleShare 3.0 includes concurrent operation of both file and print services. This includes Apple II access.
- 2) On a 5MB Macintosh IIci system you would also be able to install the Apple Internet Router, although for performance considerations it would be better to have the Apple Internet Router reside on a dedicated Macintosh. High traffic involving one of the applications can severely impact the performance of the other.
- 3) Although it is possible to define up to 8,192 users/groups (including the ability to log on from an Apple II), we would recommend not more than 2,000 users/groups. As the number of users/groups grows beyond 2000 and approaches 8000, it can take significantly longer to start up because it takes longer for AppleShare 3.0 to read through so many names. It doesn't affect server running performance or the amount of RAM required. The limitations regarding the number of users, Macintosh and Apple II alike, that can sign on concurrently is defined in the AppleShare 3.0 File Server Preferences. AppleShare 3.0 can accommodate up to 120 connections at one time.

If you plan to have Apple IIGS systems start up over the network, experience has shown that the length of time it takes to have more than 20 Apple IIGS systems do so may exceed the customers expectations. This will not be a problem if the Apple II systems are starting locally and then logging on to the file server.

## AppleTalk Remote Access: Hayes SmartModem 9600, Custom CCL

Revised: 11/21/91  
Security: Everyone

AppleTalk Remote Access: Hayes SmartModem 9600, Custom CCL Tools

=====

Article Created: 22 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

AppleTalk Remote Access doesn't ship with a setup for the Hayes SmartModem 9600. (If you use the standard 9600 with the Ultra CCL, it connects only at 2400, not 9600.) Where can we get a tool to create CCLs for other types of modems for use with AppleTalk Remote Access?

DISCUSSION -----

SmartModem 9600

-----

The Hayes V-Series SmartModem 9600 (also known as the Express 96) uses Advanced Hayes Proprietary 9600 Communications. Due to the nonstandard and proprietary nature of the modems (they are not V.32 compatible), Apple decided not to include a CCL for them.

An Express 96 can only communicate at 9600 baud with another Express 96. As you discovered, use of the "Hayes Ultra 96" CCL limits communications to 2400 baud between Express 96 modems. A "CCL.Hayes V9600" CCL has been developed internally for use with the Express 96.

Tool for Custom CCLs

-----

The Modem Workshop HyperCard stack used to develop AppleTalk Remote Access CCLs is available for customers through APDA.

## A/UX: How to Configure for EtherTalk Support (9/94)

Revised: 9/2/94  
Security: Everyone

A/UX: How to Configure for EtherTalk Support (9/94)

=====

Article Created: 4 November 1991  
Article Reviewed/Updated: 2 September 1994

TOPIC -----

How do I install the EtherTalk drivers under A/UX? Neither the EtherTalk Installer Disk nor the Network CDEV seems to work.

DISCUSSION -----

Network protocols, like TCP/IP and AppleTalk, must be configured into the A/UX kernel before they can be used. When A/UX is shipped, TCP/IP is not part of the kernel. AppleTalk is installed but configured only for the LocalTalk port, not over an Ethernet card.

To add networking capability through the Ethernet port, you must add a low-level driver to the kernel. The EtherTalk drivers on the EtherTalk Installer disk install an Ethernet driver for the Macintosh Toolbox to use. Because, under A/UX, the Macintosh Toolbox environment relies on the A/UX kernel to take care of networking, installing a Macintosh Toolbox level driver is not enough.

To use either TCP/IP or EtherTalk protocols, add the Ethernet driver using the newconfig command. See the directions in the "Network System Administration" manual for a full description of configuring the kernel for Ethernet. The short version follows.

Before beginning, you must have the following:

- An IP address
- A broadcast address
- A netmask and a hostname.

Check with your network administrator if you aren't sure what these should be in your installation. These instructions assume an Apple Ethernet card. If your

Ethernet card is from another vendor, you will need to get A/UX drivers for the card. The Macintosh OS drivers are not sufficient to establish Ethernet services (TCP/IP or AppleTalk) under A/UX. Follow the instructions from the vendor for how to install the A/UX drivers and configure the kernel.

- 1) Assuming you have an Apple card (or have properly configured your third-party card), from the Command Shell, type the line:

```
newconfig bnet
```

- 2) If you also need nfs services, type:

```
newconfig nfs
```

The system will reconfigure itself to include the new modules. It will prompt you to answer several questions, including IP address, broadcast address, and so on. When it asks if you want this system to be a Yellow Pages client, say no.

--WARNING-- If the system is configured to be a Yellow Pages client when there is no Yellow Pages server present on the network, or if the A/UX system can't talk to the YP server for any reason, the A/UX system will hang forever on the next boot. This is because it is trying to connect to a server that doesn't exist. It's much safer to say "no" to being a YP client now and turn on the YP daemon later, after the TCP/IP connections have been verified.

## A/UX: Using Claris FileMaker

Revised: 9/24/92  
Security: Everyone

A/UX: Using Claris FileMaker

Article Created: 4 November 1991

### Article Change History

-----  
08/31/92 - REVIEWED  
o For technical accuracy.

### TOPIC -----

FileMaker works great when I'm logged in as root, but if I log in as anyone else, it says it can't execute.

### DISCUSSION -----

Check the ownership and permissions of a directory called "Claris" in the global System Folder. Along with other Claris applications, FileMaker stores temporary files in a folder called "Claris" in the current System Folder.

If the folder doesn't exist, FileMaker creates it and starts putting temporary files there. However, new files and directories under A/UX are created with a default user mask. This mask sets the permissions on the file or directory to allow write permission only to the user who created the file or directory. As a result, the first account to use FileMaker would have a Claris folder created, but only that account could write to it. The solution is to change the permissions on the Claris folder to allow read and write access by everyone.

## A/UX: Why Root Has More Space Available than Regular Users

Revised: 8/17/93  
Security: Everyone

A/UX: Why Root Has More Space Available than Regular Users

=====

Article Created: 4 November 1991  
Article Reviewed/Updated: 31 August 1992

TOPIC -----

Why do root and regular users have different amounts of space available on their file systems?

DISCUSSION -----

A/UX follows the Berkeley file system. There's a default high-water mark of 10 percent of disk space that isn't available for use by non-privileged users, although you can adjust this with the tuneefs command. Root, however, can do anything, including filling the file system to capacity.

LaserWriter IINTX and IIIf/IIg: Hard Drive Formats Are Different

=====

Article Created: 31 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have a hard drive formatted for and connected to my LaserWriter IINTX.  
Can I connect this hard drive directly to either a LaserWriter IIIf or  
LaserWriter IIg without reformatting the drive?

DISCUSSION -----

The hard drive formats for the LaserWriter IINTX and Apple LaserWriter IIIf  
and IIg are different. If you want to connect a hard drive formatted for  
the LaserWriter IINTX to an Apple LaserWriter IIIf or IIg, you have to  
reformat the hard drive and reinstall the fonts with the LaserWriter Font  
Utility.

Printing: Background Printing Is Normally Slower

=====

Article Created: 8 August 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Documents printed with non-TrueType screen fonts under background printing take several minutes per page on the Personal LaserWriter LS. Why?

DISCUSSION -----

This is normal. The advantage of background printing is that it lets you work on a task while a document is printing. Printing in the background means that printing must share the processor with some other process instead of taking all the processing speed. Therefore, it is slower. What you see is normal.

## A/UX: Syslog Doesn't Log su Attempts (8/94)

Revised: 8/30/94  
Security: Everyone

A/UX: Syslog Doesn't Log su Attempts (8/94)

=====

Article Created: 8 August 1991  
Article Reviewed/Updated: 30 August 1994

TOPIC -----

It looks like syslog does not record attempts to su nor failed login attempts. Syslog does record some events, but it won't record them to a remote host.

DISCUSSION -----

Correct. Syslog belongs to Berkeley UNIX, and A/UX to System V. A/UX login, su, and other programs don't make the calls to syslog, so the messages can't be recorded. The manual page should be updated to reflect this fact. As it stands now, the syslogd man page says that login and su generate syslog messages; this is incorrect.

Logging messages to a remote system is broken, and an SPR has been filed.

A/UX: How to Create a Bootable Partition with HD SC Setup

=====

Article Created: 12 August 1991  
Article Last Reviewed: 3 July 1992  
Article Last Updated:

TOPIC -----

A/UX 2.0 installation onto an Apple 160MB hard drive fails with a "no valid root partition" message. I used the "50% A/UX, 50% Macintosh OS" option within HD SC Setup.

DISCUSSION -----

The "50% A/UX, 50% Macintosh OS" option creates a disk with half the space in a Macintosh volume and the other half set up for a random A/UX file system. These partitions are not suitable for a bootable A/UX system.

To reserve 80MB for the Macintosh operating system with the remaining space for A/UX, follow these steps:

- 1) Bring up HD SC Setup, and select the standard A/UX Partition option.
- 2) Click the Custom button to do custom partitions.
- 3) Select the Macintosh Partition and delete it.
- 4) Click and drag the existing A/UX partitions closer to one another to concentrate all the gray space (representing unallocated space on the disk) at the bottom.
- 5) Create a new Macintosh partition; click in the gray space, select Macintosh Volume as the partition type, and make the size equal to the maximum available.
- 6) Click "Done" and quit HD SC Setup.

## A/UX: Using Claris MacWrite II (9/94)

Revised: 9/9/94  
Security: Everyone

A/UX: Using Claris MacWrite II (9/94)

=====

Article Created: 12 August 1991  
Article Reviewed/Updated: 9 September 1994

TOPIC -----

Printing from MacWrite II under A/UX doesn't work. Nothing comes out of the printer. Printing from lpr works as does printing from other Macintosh Toolbox applications.

DISCUSSION -----

Like other Claris products, MacWrite II puts temporary files in a Claris folder located in the System Folder. This folder is created the first time a Claris product runs. If the user happens to be root at the time the application is run, the default user mask sets the privileges on the folder, so that only root has read and execute privileges on the folder.

Change the permissions on the folder to allow read, write, and execute privileges for everyone, and printing should work fine.

A/UX: How to Keep Users from Starting from a Floppy

=====

Article Created: 12 August 1991

### Article Change History

-----

08/31/92 - REVIEWED  
• For technical accuracy.

### TOPIC -----

Is there a way to prevent students and other users from starting their A/UX systems from a floppy?

### DISCUSSION -----

There's no way to achieve that level of security, given the way the Macintosh OS works on a normal Macintosh. Beyond locking up the physical computer, there is no way to prevent people from turning their systems off and restarting from a floppy.

One potential workaround would be to unplug the floppy-drive cable from the logic board. This wouldn't stop someone who knew what to look for, but it would get in the way of the less knowledgeable.

Security: Everyone

AppleShare 3.0: Upgrading Client Software Highly Recommended

=====

Article Created: 29 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I've recently installed AppleShare 3.0.

When I configured the server using Admin, I set up each user with NO password, and I also set the minimum length of each user's password to 4. Additionally, I checked the option that forces the users to change their passwords the next time they log on.

When I try to log on to the server from the IIX, I get a message that an unknown AppleShare error has occurred. It's not fatal -- I just can't log on. By adding a 4+ letter default password to each user, I can then log on.

Since I support an installed base of over 80 File servers and 6,000 Macintosh computers, I want to stress that whatever options we install with AppleShare 3.0, they must work with 2.01 client software. It's unlikely that most of the installed base will migrate to 3.0 client software.

Configuration:

- Server: Macintosh SE/30 4/80 with System 7.0 and AppleShare 3.0 (all product options) installed.
- Client: Macintosh IIX 5/40 with System 7.0 and AppleShare 2.01 client code.

DISCUSSION -----

The source of your problem is exactly what you are trying to avoid. Without the AppleShare 3.0 client software installed, the client software doesn't

understand the messages the server sends to it. For example, using an all AppleShare 3.0 setup, if you need to change your password, you will get the dialog that allows you to change your password. If you have old client software, then you will only get an unsuccessful log-on message. The ability to log on without getting help from an administrator is more than a minimal benefit.

If an administrator is going to take advantage of AppleShare 3.0's extended security features such as minimum password length, or change password at the next log on time, then we highly recommend that you install the client software. You can install it over the network, without restarting, and it won't cause any disruption in the users' operation.

Security: Everyone

AppleTalk Remote Access: Managing SecurityZone

=====

Article Created: 29 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

On an AppleTalk InterNet, I can have different buildings (sites, countries, continents...) interconnected. How do I manage the SecurityZone feature so that local administrators can control their Remote Access connections?

DISCUSSION -----

We have assumed there is one person in charge of the entire internet. That person is then responsible for communicating password information to all the local administrators -- even between continents.

If there is more than one Security Zone on an internet, then the AppleTalk Remote Access server needs to have the right password for only one of the zones.

A/UX: ASCII Codes Returned By Function Keys Under Command Shell

=====

Article Created: 18 November 1991  
Article Reviewed/Updated: 17 June 1993

TOPIC -----

How can I find out what ASCII codes are returned by the function keys under the command shell?

DISCUSSION -----

Follow these steps:

- 1) Open a vi window; type vi testfkey and press Enter
- 2) To begin entering data, press Escape i
- 3) In the window, press Control-v followed by the function key.
- 4) To quit vi and save the file, press Escape ZZ Enter
- 5) With the function key keystroke captured, run od on the document to find out the ASCII/hex codes. For example, to see the contents of the file in hex, type od -h testfkey and press Enter.

Other od flags include:

- a to display bytes under their ASCII names
- d, l, or i to display bytes in decimal
- h to display bytes in hex

## A/UX: Adding Swap Space without Repartitioning (6/93)

Revised: 8/12/93  
Security: Everyone

A/UX: Adding Swap Space without Repartitioning (6/93)

Article Created: 18 November 1991  
Article Reviewed/Updated: 17 June 1993

TOPIC -----

I keep getting a message about running out of swap space. Is there an alternative to repartitioning the disk and enlarging the size of the swap partition?

DISCUSSION -----

Yes. You need to add a new swap space on a different hard drive and use the command `swap -a` to have the system recognize the space. The command `swap -l` (lowercase "el") will give you the status of the current swap space.

Article Change History:

A/UX: Questions About Using tar (11/95)

=====

Article Created: 18 November 1991  
Article Reviewed/Updated: 28 November 1995

TOPIC -----

- 1) How can I use tar to create a backup of a directory and compress the output?
- 2) How can I read a tar floppy if I receive the message "This is not a Macintosh disk" when I insert the disk?

DISCUSSION -----

- 1) The easiest way to do this in one step is with the command:

```
tar -cvf - dir_name | compress > dir_name.tar.Z
```

The file dir\_name.tar.Z is now your compressed backup file.

- 2) Make the CommandShell the front-most application and insert the disk. Under A/UX 2.0 you will be prompted with a dialog asking if the disk is an A/UX or Macintosh floppy. (On A/UX 2.0.1 or later that dialog no longer appears.) Select A/UX and at the prompt type:

```
tar -tvf /dev/floppy0    To list the contents of the floppy
tar -xvf /dev/floppy0    To extract the contents of the floppy to the
                           current directory.
```

Apple II 3.5 Disk Controller Card: Specifications (2/97)

=====

Apple II 3.5 Disk Controller Card: Specifications (2/97)

Article Created: 11 December 1991  
Article Reviewed/Updated: 12 February 1997

TOPIC -----

This article gives technical specifications for the Apple II 3.5 Disk Controller Card. This card has been discontinued by Apple.

DISCUSSION -----

### Overview

-----  
The Apple II 3.5 Disk Controller Card allows you to use the 3.5-inch floppy disk drives, including the Apple SuperDrive and Apple 3.5 Drive, with an Apple IIGS or Apple IIe computer. The card also supports the operation of older model Apple II UniDisk 3.5 drives with the Apple IIe computer. This card replaces the UniDisk 3.5-inch Controller Card.

### Drives Supported

-----  
Apple SuperDrive

Apple 3.5 Drive

Apple UniDisk 3.5 Drive (Apple IIe only)

### Specifications

-----  
Microprocessor: 65C02

Disk controller: SWIM

Memory: 32K SRAM 32K ROM

Connector: DB-19

Power: Less than 4 watts

#### Environmental Requirements

---

Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)

Storage temperature: 50 to 140 degrees F (10 to 60 degrees C)

Relative humidity: 20% to 80% noncondensing

## System Software 7.0.1: Support for PowerBook

Revised: 5/17/94  
Security: Everyone

System Software 7.0.1: Support for PowerBook

Article Created: 21 October 1991

TOPIC -----

This article describes the features of system software version 7.0.1 that support the Macintosh PowerBook computers.

DISCUSSION -----

Caps Lock Extension

-----  
The Caps Lock key doesn't stay mechanically pressed down on the PowerBook computers. Caps Lock is an extension that adds an international caps lock symbol as a caps lock indicator to the menu bar. The symbol may not appear the instant the Caps Lock key is pressed, because the processor may have other tasks to handle before the Caps Lock extension is executed. Even though the menu-bar symbol may not change immediately, the keyboard does toggle immediately whenever you press the Caps Lock key.

Revised Low Power Dialogs

-----  
There are fewer low power dialogs. A lower voltage level prompts the dialogs to increase battery life and eliminate any memory effect on the NiCad battery. The last dialog box (10 second warning) comes up when the battery voltage is low enough to eliminate the memory effect. There are three dialog boxes that come up. The first dialog appears when about 15 minutes of life remains. The backlight dims to reduce power consumption. This is the time to save documents and plug in the power adapter. If operation continues, a second low-power message is displayed. At this point, you may have just enough time to save your documents. Finally, a 10 second dialog appears and the unit sleeps. If you plug in the power adapter within the next two days, all documents are saved.

New Portable Control Panel

-----  
The Portable Control Panel modification eliminates the brightness/contrast controls for the Macintosh PowerBooks. The Macintosh Portable gets this

information from the Brightness Control Panel. This panel still selects the time until hard disk drive and system sleep. It also allows selection of internal or external modems on the Macintosh PowerBooks 140, 145, and 170 and the original Macintosh Portable. The PowerBook 100 doesn't have this option because it has no external modem port.

When clicking the "Minutes Until Automatic Sleep" text while holding down the Option key, the system rest dialog box appears. This causes a dialog to appear that allows turning the rest feature on or off.

#### Battery Control Panel

-----

This controls a number of options and provides a visual indicator of the charging status of the battery. You click the flag to see a number of options, depending on which PowerBook model you have. A sleep button comes up on all the portables (the Macintosh Portable and all PowerBook models). Power-Saver buttons come up on the Macintosh PowerBook 170. Power-Saver changes the processor speed to 16MHz on the PowerBook 170 to increase battery life.

#### Article Change History

-----

09/24/92 - Corrected to show that there are three low-power messages, not two.  
08/03/92 - Updated for PowerBook 145.

## System Software 7.0.1: Support for Quadra 700, 900, 950

Revised: 9/25/92  
Security: Everyone

System Software 7.0.1: Support for Quadra 700, 900, 950

=====

Article Created: 21 October 1991

### Article Change History

-----

09/24/92 - UPDATED

- To include Quadra 950.

### TOPIC -----

This article describes the features of system software version 7.0.1 that specifically support the Quadra 700, 900 and, 950.

### DISCUSSION -----

#### Virtual Memory

-----

The MMU table format changed in the 68040 CPU. The 68040 copy-back cache mode requires microprocessor-specific modifications to virtual memory. The ROM supports page write protection that prevents modification of RAM pages to ensure data integrity of those pages. The RAM disk feature of the Memory control panel uses this feature.

#### Network Control Panel

-----

The Network control panel allows switching between physical networks such as built-in LocalTalk and Ethernet. The Quadra 700, 900, and 950 required modifications to the Network control panel to select the internal Ethernet connection.

#### Keylock Support

-----

The keylock switch support disables all ADB activity, including power on in the secure position. The software programs the clock/ADB chip which controls ADB functions.

## System Software Version 7.0.1: New Features

Revised: 9/25/92  
Security: Everyone

System Software Version 7.0.1: New Features

=====

Article Created: 21 October 1991

### Article Change History

-----

09/24/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

This article lists the new features of Macintosh system software, version 7.0.1.

### DISCUSSION -----

System software version 7.0.1 supports the following new or revised features:

- Installer Script and CPU name support
- Memory control panel revisions
- Additional shutdown dialogs
- Revised Sound Manager
- Enhanced SANE routines
- Revised Brightness Control Panel
- Revised Network Control Panel to support on-board Ethernet
- Caps Lock indicator
- Revised low-power dialog messages

- Revised Portable control panel
- SCSI Disk Mode
- Battery DA modification

#### Memory Control Panel

-----

The Memory Control Panel now supports a RAM disk on the Macintosh Portable, the PowerBooks, and the Quadra 700, 900, and 950. The RAM disk can only be used if the system has at least 3MB of memory.

#### Revised Shutdown Warning

-----

A shutdown warning dialog appears on the PowerBook 140 and 170 and the Quadra 700 and 900 saying that you will lose all data in the RAM disk if you continue the shutdown. The dialog doesn't appear if there is no RAM disk, or if there are no files on the RAM disk.

NOTE: RAM disks on the Macintosh Portable and PowerBook 100 don't go away when the system is shut down. The warning is not needed on those computers.

#### Sound Manager Updates

-----

The Sound Manager now supports the sound chips in the computers listed here. These computers use different sound chips, and the Sound Manager responds differently for each system.

| Computer             | Sound Input | Sound Output |
|----------------------|-------------|--------------|
| -----                | -----       | -----        |
| PowerBook 100        | No          | Mono         |
| Macintosh Classic II | Yes         | Mono         |
| PowerBook 140        | Yes         | Stereo       |
| PowerBook 170        | Yes         | Stereo       |
| Quadra 700           | Yes         | Stereo       |
| Quadra 900           | Yes         | Stereo       |

#### Enhanced SANE Routines

-----

A significant System file change provides a new SANE package for the Macintosh IIsi (when FPU is installed), IIfx, IIci, PowerBook 140 and 170, and Quadra 700 and 900. The SANE changes the trap call to a JSR that points directly to the SANE code in the system heap, bypassing the trap dispatcher. This increases the performance up to two and one-half times for integer and 5 to 6 times for floating point.

#### Brightness/Contrast Control Panel

-----

The Brightness control panel modification supports the Macintosh Classic II. This driver is used with the Macintosh Classic, Macintosh Classic II, and the original and backlit Macintosh Portables.

This control panel doesn't work with the PowerBook computers. The PowerBook software reads from the slider controls and adjusts the screen brightness based on those values. The Power Manager handles the screen update and checks the sliders.

#### Backlight Driver

-----  
The Backlight driver supports the PowerBook computers and the Macintosh Classic II. This driver gets data from the Brightness control panel for the Macintosh Portable and the Macintosh Classic II, and from the slider or knobs on the PowerBook computers.

## PowerBook: Sound Circuitry Power Conservation (8/93)

Revised: 5/16/94  
Security: Everyone

PowerBook: Sound Circuitry Power Conservation (8/93)

=====

Article Created: 29 October 1991  
Article Reviewed/Updated: 16 August 1993

TOPIC -----

My PowerBook 140 emits a click from the speaker from time to time. Is this common, or is my unit defective?

DISCUSSION -----

The system software detects if the sound chip is being used. If it hasn't been used for a while, power is disconnected from the sound circuitry in order to conserve power. During this shutdown process, a click may be heard from the speaker.

This power saving mode mostly affects the PowerBook 100, 140, 145, and 170. On more recent PowerBook models, it is possible to disable sound entirely by moving the volume to zero in the Sound control panel. Once the volume is set at zero on those models, even the startup sound will not chime. There will be no clicks from the speaker with the volume set to zero since the power to the sound circuitry is always off.

Article Change History:  
16 August 1993 - Revised article with information about recent models.

## PowerBook: Screen Power Consumption and Battery Life (7/92)

Revised: 5/16/94  
Security: Everyone

PowerBook: Screen Power Consumption and Battery Life (7/92)

Article Created: 29 October 1991  
Article Reviewed/Updated: 31 July 1992

TOPIC -----

Does the use of white pixels draw more power than the use of black pixels on the PowerBooks (supertwist and active matrix)?

We're comparing the PowerBook 100 to several PC-compatible notebooks, and found that the PowerBook 100 doesn't have quite the battery life of some PC-compatibles. We're wondering about the screen's power consumption. We have some information on the PC-compatibles that says using the screens in inverse mode (black text on a white background) uses more power than their normal mode (white text on a black background). Is it worth setting the desktop pattern to all black or not?

DISCUSSION -----

### Screen Power Consumption

The black screen and the white screen draw almost the same amount of power: the black slightly less than the white (approximately 300 mW versus 320 mW).

The real power draw is the backlight (approximately 2.5 watts). The backlight at maximum is the largest power consumer of the entire system. Because most customers really use the light at maximum, Apple quotes battery life with the light on full brightness. We can't speak for how other manufacturers quote their battery life. However, the black versus white background argument is not valid in discussing battery life.

### Battery Size Versus Weight

Not all batteries are exactly the same, but Apple uses a state-of-the-art NiCad battery. In this class of battery, capacity and weight are directly related. Competitors with higher system weight may have larger batteries, and therefore, longer battery life.

## Truth in Testing

-----

Apple tries to provide a real battery life description. We hear many reports of portable computers not meeting their reported battery life. Sometimes we suspect the testing procedure. Additionally, every manufacturer tests with a fully charged battery. NiCad charging is somewhat tricky; therefore, consumer reports of less than expected battery life need to be interpreted as a function of the NiCad charging sequence, battery history, and other factors. Apple uses an intelligent charging system to provide the best recharging possible.

## PowerBook 100: When It Won't Recognize Third-Party Drive (8/92)

Revised: 5/16/94  
Security: Everyone

PowerBook 100: When It Won't Recognize Third-Party Drive (8/92)

=====

Article Created: 30 October 1991  
Article Reviewed/Updated: 3 August 1992

TOPIC -----

My PowerBook 100 won't recognize non-Apple hard drives.

DISCUSSION -----

Are you using one terminator in the chain? This means either an external terminator or a built-in terminator to the third-party device.

The termination on the PowerBook 100 hard disk drive isn't strong enough to support the bus. So if the third-party device doesn't have an internal terminator, you need to provide an external terminator.

## PowerBook: How to Clean the Trackball (7/96)

Revised: 7/1/96  
Security: Everyone

PowerBook: How to Clean the Trackball (7/96)

Article Created: 13 November 1991  
Article Reviewed/Updated: 01 July 1996

TOPIC -----

My PowerBook's trackball doesn't work smoothly; it appears to "stick" or "jump" when rolled.

DISCUSSION -----

Most PowerBook trackball problems are due to contamination of the rollers. The trackball is just like the standard Apple mouse in that dust and debris can accumulate on the rollers and impede smooth movement of the trackball.

Symptoms of a Dirty Trackball  
=====

Symptoms that your trackball is dirty are:

- The trackball appears to "stick" or "jump" when rolled.
- The cursor will not track horizontally or vertically.
- It sometimes seems like the cursor is "hitting a wall".
- On-screen buttons fail to activate when you click on them.
- The movement of the cursor on the screen isn't smooth.
- The trackball is physically difficult to roll.

How to Clean the Trackball  
=====

- 1) Remove the trackball retaining ring by turning it counterclockwise until it pops out (about 1/4 turn). You don't need tools for this; you can just press against the two small ridges on the ring with your fingernails.
- 2) Lift the retaining ring and trackball out of its cavity.

- 3) Locate the small rubber rollers at the left and bottom sides of the trackball cavity. Depending on your model, they may look like small rings or wheels.
- 4) Use any reasonably clean, blunt object (such as your finger or a cotton swab) to wipe off the rollers. Do not use any liquid, including any amount of cleaning fluid or water, inside the computer.
- 5) Locate the three white or red bearings located at approximately clockwise 4:00, 7:00, and 11:00 in all PowerBooks except the PowerBook 100, which has three black posts instead of bearings. Using a fingertip, dry cotton swab, or other blunt object, clean them of any debris.
- 6) Replace the trackball and the retaining ring.

In addition, on a PowerBook 140 or 170, reseating the cables on the trackball and keyboard may solve the problem. This is very effective if the failure is related to the computer heating up. These cables are located inside the PowerBook, so your authorized service provider or Apple must do this.

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature).

## 400MB, 3.5-Inch, Half-High, SCSI Hard Disk Drive: Connectors

Revised: 5/15/92  
Security: Everyone

400MB, 3.5-Inch, Half-High, SCSI Hard Disk Drive: Connectors

=====

Article Created: 23 October 1991  
Article Last Reviewed: 14 May 1992  
Article Last Updated: 14 May 1992

### TOPIC -----

This article describes the connectors used in the 400MB SCSI hard disk drive.

### DISCUSSION -----

#### Power Connector

-----

The power for the drive is provided through a 4-pin male polarized connector. Pin 1 is the rightmost pin when viewing the connector with drive top cover up.

#### SCSI Connector

-----

The SCSI connector is a 50-pin, shrouded (4-sided), male, keyed, right-angle connector. Pin 1 is the rightmost pin of the upper row when viewing the connector with drive top cover up (key slot up).

#### Termination

-----

Removable termination resistor packs with standard SCSI 220/330 termination resistors. The packs are removable without having to remove the board. The drive provides termination power to the TERMPWR line (pin 26) of the SCSI bus through a diode and provides a 1.5 amp current-limiting function.

#### Device Select Connector

-----

The device select connector is a 6-pin male connector located behind the power connector along the drive side. Nominal pin spacing is 0.100

inches.

#### LED Connector

-----  
The LED connector is a 2-pin, right-angle, un-shrouded, nonpolarized male header to connect with the LED cable assembly. Nominal pin spacing is 0.100 inches. It is located on the opposite end of the drive from the SCSI connector.

#### Connector J6

-----  
Connector J6 is an 8-pin male connector located on the side of the drive away from the SCSI connector. Pin 1 is the bottom pin farthest from the SCSI connector end.

- Pin 1 - Not Jumpered (Factory use only)
- Pin 2 - Not Jumpered (Motor start option)
- Pin 3 - Not Jumpered (Delayed Motor start option)
- Pin 4 - Not Jumpered (Write-protect option)
- Pin 5 - Jumper Installed (Parity checking and error reporting)
- Pin 6 - Not Jumpered (Reserved for later use)
- Pin 7 - Jumpered in a Macintosh Quadra 900/950  
(Termination Power is supplied to the SCSI bus.)
- Pin 8 - Jumpered in a Macintosh Quadra 700  
(Termination is supplied to the drive terminators.)

#### Note

-----

## 400MB, 3.5-Inch, Half-High, SCSI Hard Disk Drive: Overview

Revised: 12/13/91  
Security: Everyone

400MB, 3.5-Inch, Half-High, SCSI Hard Disk Drive: Overview

=====

Article Created: 23 October 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

This article describes the Apple 400MB SCSI hard drive.

DISCUSSION -----

The 400MB hard disk drive is intended for use in the Quadra 700 and 900 computers, as well as other Apple products. The drive possesses features that benefit many different applications.

The hard disk assembly consists of as few mechanical components as possible. It's designed for simplified assembly without requiring sensitive adjustments or calibration during the manufacturing process.

Powerful data error correction techniques ensure data integrity. When power is turned on, the drive releases the actuator arm assembly from the locked position, only if the read/write heads have achieved a stable flying condition. This feature ensures no direct physical contact between the heads and the data area on the disk surfaces. If power shuts off suddenly, the actuator arm automatically retracts to the landing zone before the heads make contact with the disk surfaces.

## 68040 CPU Architecture: NuBus Transfer Modes and Performance

Revised: 8/6/92  
Security: Everyone

68040 CPU Architecture: NuBus Transfer Modes and Performance

=====

Article Created: 12 November 1991  
Article Last Reviewed: 5 August 1992  
Article Last Updated:

TOPIC -----

Can you give information about the architecture of the 68040 CPU? It isn't clear which master/slave transfer modes are supported in the 68040 computer between the host and the NuBus. What would the NuBus Block Transfer Modes Resource Entries look like for the 68040 computer per the DTS Technical Note #288? What performance can we expect?

DISCUSSION -----

The Macintosh Quadra computers support all sizes of block transfers when the main logic board is accessed as a slave device. (The NuBus specification states that if a slave accepts any block transfer, it must accept all block transfers.) As a NuBus master, the Quadra doesn't initiate block transfers. NuBus masters don't have to support all sizes of block transfers.

The data rate a NuBus master will see when doing block transfers to the main logic board is 8 to 10 MB/sec, depending on main memory refresh cycles and synchronization delays. This is a maximum rate that can be achieved only if the NuBus master does nothing but block transfers (that is, it moves data continuously without doing any other operations). A more realistic maximum rate is 4 to 5 MB/sec.

When the main logic board is the bus master, the transfer rate depends greatly on the speed of the NuBus slave device. A zero wait state NuBus slave (none of which exist as far as we know) could give peak transfer rates approaching 20 MB/sec. Real NuBus slave devices will probably have transfer rates under 10 MB/sec (more like 2 to 4 MB/sec). The only way to really determine how fast a Quadra can transfer data to a NuBus slave is to run real code and time the bus transfers.

## Macintosh Quadra 900: Dual Channel SCSI

Revised: 8/6/92  
Security: Everyone

Macintosh Quadra 900: Dual Channel SCSI

=====  
Article Created: 12 November 1991  
Article Last Reviewed: 5 August 1992  
Article Last Updated:

TOPIC -----

What is the value of dual channel SCSI on the Macintosh Quadra 900?

DISCUSSION -----

The dual SCSI implementation on the Quadra 900 means several things:

- Because the SCSI chains are electrically separate, there won't be any interruption on the internal chain if something goes wrong on the external chain (like a disconnect while the computer is on, poor termination schemes, and so on).
- It gives third parties (and potentially Apple) the opportunity to implement disk arrays using the two chips. Micronet is advertising their Raven array without using two NuBus slots.
- You can assure speed of the drive internally using the internal cabling, and not limit the speed of a drive by the cable you use (frayed cables, bad cables, and so on).

## MacTCP: Releasing IP Addresses

Revised: 1/28/92  
Security: Everyone

MacTCP: Releasing IP Addresses

=====

Article Created: 5 November 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

A Macintosh with MacTCP installed refuses to give up a dynamically assigned IP number until the we restart the computer.

If a Macintosh uses an application that requires an IP number from the network (in this case a GatorBox and no MacTCP installed) and the application is no longer in use, the IP is released for use by someone else. This is what it's supposed to do.

When we add the MacTCP drivers and run an application that requires MacTCP and an IP number, the Macintosh doesn't release the IP number, even after quitting this program. My explanation is the MacTCP drivers are now loaded into the Macintosh and reside there, holding on to the IP number. Hence, until the machine is shut off or restarted, it doesn't release the number.

Is this normal, and should I look for a way to release the number without shutting off the Macintosh? Or is this a bug that will be fixed or maybe someone has come up with a fix?

I have been told that the node number and IP numbers are all reset at startup time. Is this correct?

DISCUSSION -----

You are correct; MacTCP doesn't release an acquired IP address until you restart the Macintosh.

In the first instance you mention, an application has its own TCP/IP driver; NCSA Telnet 2.3 (non-MacTCP) is a good example. When Telnet tries

to open a session, the built-in TCP/IP driver is opened and an IP address is obtained. When you quit the application, the driver is removed from memory and the IP address is released.

With MacTCP, when an application or DA opens the driver, an IP address is obtained. Since MacTCP is a system-wide resource not limited to a specific application, the driver is not removed from memory when the application is quit because other applications or DAs may be using the driver as well. This causes the IP address to remain in use until you restart the computer.

This behavior is not a bug, and will not be changed in a future release of MacTCP.

## LaserWriter IIg: LocalTalk and EtherTalk Zones

Revised: 12/13/91  
Security: Everyone

LaserWriter IIg: LocalTalk and EtherTalk Zones

=====

Article Created: 21 November 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have a question about the LaserWriter IIg. I have the same printer name on both the LocalTalk zone and the Ethernet zone, and the printer is connected to both LocalTalk and Ethernet. Between these zones I have an AppleTalk Internet Router.

When I print from a Macintosh on Ethernet to the LaserWriter, I can actually reach the printer from both Ethernet and LocalTalk. Which printer port is used in that case? Does it choose the shortest way, or does it prefer LocalTalk?

DISCUSSION -----

If a LaserWriter IIg is connected to the same Internet via LocalTalk and EtherTalk, and the LocalTalk and EtherTalk connections are in the same zone, the LocalTalk connection is shut down.

If the LocalTalk and EtherTalk connections are in different zones, the printer will be advertised in both zones. If you select the LaserWriter IIg via the LocalTalk zone, all communications go through the LocalTalk port. If you select the LaserWriter IIg via the EtherTalk zone, all communications go through the EtherTalk port.

LaserWriter II Fonts 1 Disk: Zapf Dingbats Incorrectly Named

=====

Article Created: 14 November 1991  
Article Last Reviewed: 8 June 1992  
Article Last Updated: 8 June 1992

### TOPIC -----

When printing to the Apple LaserWriter II<sup>f</sup> or Apple LaserWriter II<sup>g</sup> from a Macintosh using System 7 and the LaserWriter 7.0 driver, the system will not download the Zapf Dingbats PostScript font that comes on the "LaserWriter II Install 4.0" disks. These disks come with the Apple LaserWriter II<sup>g</sup> and Apple LaserWriter II<sup>f</sup>.

### DISCUSSION -----

The problem with the Zapf Dingbats font on the LaserWriter II Fonts 1 disk (one of the "LaserWriter II Install 4.0" disks) is that the Postscript file is named incorrectly to be temporarily downloaded by the LaserWriter driver. The filename as it appears on the disk is "Zapf Dingbats." For the font to be downloaded by the LaserWriter driver, the downloadable Postscript file needs to be called "ZapfDin". Note: The incorrect name doesn't interfere with the LaserWriter Utility's ability to download the font into the printer's memory.

LaserWriter II: "Unlimited Downloadable Fonts" Slowdown

=====

Article Created: 19 November 1991  
Article Last Reviewed: 8 June 1992  
Article Last Updated:

TOPIC -----

I have an Excel 3.0 document that uses the Zapf Dingbats fonts. The document takes 30 seconds to print on my Personal LaserWriter NT. The same document takes 10 minutes to print on the LaserWriter IIf. I'm using System 7 with the Zapf Dingbats PostScript in the System Folder (it is named "ZapfDin"). Other documents in Word, FileMaker, and so on, print fine on the LaserWriter IIf.

DISCUSSION -----

We looked at the "Page Setup..." options for the document you sent. The "Unlimited Downloadable Fonts in a Document" option was turned on. With this option enabled, any font that the driver downloads is purged as soon as another font is used, even if this other font is in the printer's ROM. The document has Zapf Dingbats characters interspersed throughout. Zapf Dingbats is downloaded the first time the font is used. As soon as another font is used, Zapf Dingbats is purged from memory. When it's used again, the LaserWriter driver has to download the font again. Because of the layout of the document, the Zapf Dingbats PostScript is downloaded dozens of times.

If you disable the "Unlimited Downloadable Fonts in a Document" option, the document takes 30 seconds to print on the LaserWriter IIf.

AppleTalk Internet Router: What Happens with More than 256 Zones

=====

Article Created: 21 November 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I know the AppleTalk Internet Router supports up to 256 zones on an Internet. What happens to the AppleTalk Internet Router when the Internet it is attached to exceeds 256 zones?

DISCUSSION -----

The AppleTalk Internet Router continues to run on an Internet with more than 256 zones. The AppleTalk Internet Router doesn't return an error message in this situation.

The router will enter only 256 zones into its Zone Information Table. If the router has defined 10 zones on its own, it accepts the first 246 zones in the ZIP Reply packets it receives from the router on the Internet that responds to its ZIP Query packet. It discards the remaining 10 zones. Nodes that use this AppleTalk Internet Router to access the rest of the Internet won't be able to do NBP lookups for devices in the 10 missing zones.

## Kanji 6.0.7 and 6.0.7.1: Use U.S. Backlit Portable INIT (7/94)

Revised: 7/13/94  
Security: Everyone

Kanji 6.0.7 and 6.0.7.1: Use U.S. Backlit Portable INIT (7/94)

=====

Article Created: 19 November 1991  
Article Reviewed/Updated: 13 July 1994

TOPIC -----

Is a localized version of the Portable CDEV available for Kanji 6.0.7 that supports backlit Portables? The Portable CDEV in the Kanji system 6.0.7 on Developer CD Vol. VIII is localized, but doesn't support backlit Portables, it is for contrast only. I moved the U.S. English Portable CDEV v1.3 over to Kanji 6.0.7, and it works, but I can't find one that is both localized AND supports backlighting.

DISCUSSION -----

You're right. The Backlit Portable INIT wasn't localized in Japanese (current versions of system software, 6.0.7 and 6.0.7.1). So to use KanjiTalk on the Backlit Portable, you'll need to use U.S. Portable INIT to control the screen brightness.

## A/UX: BBX Works with A/UX 3.0 (9/94)

Revised: 9/9/94  
Security: Everyone

A/UX: BBX Works with A/UX 3.0 (9/94)

Article Created: 19 November 1991  
Article Reviewed/Updated: 9 September 1994

TOPIC -----

There is a problem with the A/UX pseudo-tty driver when running BBX (a 4GL development tool from BASIS International). Here is a detailed description of the problem:

When I open a pseudo-tty with the O\_NDELAY flag, some of the output doesn't show up on the screen until AFTER I type a character on the screen. The pty is opened unbuffered -- this is something internal to the system. The first half of a page of text prints out. I have to type something to print the rest of the page.

This doesn't happen on the console or serial ports -- only the ptys. I'm using read() and write(), not stdio, and it's unbuffered. Doing an ioctl(tcsetaw) on the fd of the pty fixes the problem, but shouldn't be necessary.

DISCUSSION -----

There is a new kernel patch for the problem between A/UX pseudo tty and BBX. We tested the BBX software with the new kernel, and it works well. This patch fixes the longstanding problem between A/UX and BBX. This fix is now included in A/UX 3.0.

## **AFE: Remove ProDOS or MS-DOS File System Before Translating 2/95**

Revised: 2/3/95  
Security: Everyone

AFE: Remove ProDOS or MS-DOS File System Before Translating 2/95

Article Created: 5 November 1991  
Article Reviewed/Updated: 3 February 1995

TOPIC -----

Is there a problem using Apple File Exchange with Works-Works Transporter v2.0 and the ProDOS File System INIT that comes with the Apple IIe Card used on the Macintosh LC?

I have a Macintosh LC and I want to convert AppleWorks files to Microsoft Works files. I can't do this when the ProDOS File System INIT is in the System Folder. When in AFE, I can go to the menu and highlight AppleWorks to Microsoft Works as the translation, but it won't accept it. It appears to accept it, but only translates in the default mode. If the ProDOS File System INIT is taken out of the System Folder, AFE with Works-Works Transporter works fine.

DISCUSSION -----

Apple File Exchange incorrectly assumes that the volumes it locates are Macintosh-readable. It isn't an issue with the Works-Works Transporter.

When AFE looks for the available volumes, it checks for the type of volume. When it finds a volume format not Macintosh-readable (that is, ProDOS or MS-DOS), then AFE displays an appropriate set of "to/from" menus for the volume format located.

The ProDOS File System INIT causes AFE to assume that the volume is Macintosh readable. Therefore, the volume doesn't appear to need translation from another operating system format. The same is true of similar INITs for MS-DOS volumes, such as AccessPC and DOSmounter.

The Macintosh foreign file system tools allow mounting the ProDOS and MS-DOS volumes on the Macintosh desktop. The INITs are the code segments that make this possible. When a volume is mountable on the Macintosh desktop, AFE considers it a Macintosh readable volume. This is an incorrect assumption for

AFE to make.

Until Apple File Exchange is revised to allow mounting other volume formats on the Macintosh desktop, the only method of using AFE translation (beyond the text-to-text mode) is to remove the ProDOS or MS-DOS file system INIT from the System Folder and restart the Macintosh. Then use AFE to perform the translation. To have the ProDOS or MS-DOS volume mountable on the desktop again, replace the file system INIT in the System Folder, and restart the Macintosh.

A/UX 2.0: Standard Toolbox Calls from within A/UX

=====

Article Created: 8 NOVEMBER 1991

Article Change History

-----

08/31/92 - REVIEWED

•For technical accuracy

TOPIC -----

Can you make calls to the standard toolbox from within A/UX? What books and other resources can help?

DISCUSSION -----

The most important of the A/UX programmer's manuals is probably the A/UX Toolbox Macintosh ROM Interface, which details the Macintosh Toolbox calls that are available under A/UX.

Using this information, you need to decide what type of application you want. It is possible to write your application under the Macintosh OS in any of the development systems available to you there, as long as you take into account which Toolbox calls are available to you under A/UX. This would give you the added benefit of having your application run under both A/UX and the Macintosh OS.

The A/UX Developers Tools from APDA gives you the benefit of programming under A/UX, and this package includes a number of very useful tools designed specifically for A/UX development. This package is centered around an A/UX-compatible version of the Macintosh Programmer's Workshop, so if you are familiar with that package, you will be right at home. Note that applications written in this environment will not be able to run under the native Macintosh OS.

- Macintosh Performa 600
- Macintosh Performa 630, 635, 636, 637, 638
- Macintosh Portable
- Macintosh Quadra 605
- Macintosh Quadra 630
- Macintosh Quadra 660AV

- Macintosh Quadra 700
- Macintosh Quadra 800
- Macintosh Quadra 840AV
- Macintosh Quadra 900
- Macintosh Quadra 950
- All Power Macintosh models
- PowerBook 100
- PowerBook 140 and 145
- PowerBook 145B
- PowerBook 150
- PowerBook 170
- PowerBook 160
- PowerBook 165
- PowerBook 165c
- PowerBook 180
- PowerBook 180c
- PowerBook 520
- PowerBook 520c
- PowerBook 540
- PowerBook 540c
- PowerBook Duo 210
- PowerBook Duo 230
- PowerBook Duo 250
- PowerBook Duo 270c
- PowerBook Duo 280
- PowerBook Duo 280c

The RAM Disk feature was first built into the ROMs of the Quadra models, and subsequent models include this feature. Models without this code in ROM can't support the System 7.x RAM disk feature, and no software workaround is currently available.

Third-party software is available to provide this function for most Macintosh models. You can use shareware programs, like Ram Disk or AppDisk, available on most on-line services. Or you can purchase Maxima from Connectix. To locate a vendor's address and phone numbers, use the vendor name as a search string.

Note: The Assistant Toolbox extension in the PowerBook File Assistant saves the RAM disk contents between shutdowns.

#### Article Change History:

## Pers LW LS: Serialport Arbitrator/PrintMonitor Conflict (11/94)

Revised: 11/21/94  
Security: Everyone

Pers LW LS: Serialport Arbitrator/PrintMonitor Conflict (11/94)

=====

Article Created: 11 November 1991  
Article Reviewed/Updated: 21 November 1994

TOPIC -----

I just installed Apple Remote Access. Now when I try to print to my Personal LaserWriter LS with background printing enabled, I get a message that there is "no LaserWriter available, please check the power and connections."

If I turn background printing off, it works fine. It also seems that everything runs fine if I remove the Serialport Arbitrator from the Extensions folder.

DISCUSSION -----

This is a known conflict between the Serialport Arbitrator and PrintMonitor with the Personal LaserWriter LS. It occurs with system software version 7.0 or 7.0.1, and with the Personal LaserWriter LS driver version 7.0 or 7.1.

The only current workaround is to either disable background printing, or remove the Serialport Arbitrator, as you have already discovered.

## Personal LaserWriter LS: Scaling Limits

Revised: 1/30/92  
Security: Everyone

Personal LaserWriter LS: Scaling Limits

=====

Article Created: 11 November 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I'd like to print to the Personal LaserWriter LS at 85% reduction, but only 50% and 75% are available. Is there a way to get reduction in print size, via the page layout, other than 50% and 75%?

DISCUSSION -----

The current implementation of the Personal LaserWriter LS driver is limited to the 25% reduction increments, and there is no way to modify this.

A possible workaround is called DynoPage, by Portfolio Systems, Inc. In addition to reduction options, it allows double-sided printing and printing to any page size. It can be extended to user-specified page layouts.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

## DAL Server for MVS to Access IBM DB-2 Database (11/94)

Revised: 11/11/94  
Security: Everyone

DAL Server for MVS to Access IBM DB-2 Database (11/94)

=====

Article Created: 5 November 1991  
Article Reviewed/Updated: 11 November 1994

TOPIC -----

I have an IBM 3090 Mainframe running virtual memory and MVS. The database of choice is DB-2. Do you have a DB-2 DAL Server that runs on a 3090 running MVS and virtual memory?

DISCUSSION -----

You need Data Access Language Server for MVS/TSO or the server for MVS/V TAM. These products provide support for DAL-based applications using data residing in the IBM DB-2 or Teradata DBC/1012 databases. They work with existing DB-2 databases, operating under standard MVS and database security.

DAL Server for MVS/TSO v1.3 supports MVS/XA release 2.2 or greater, DB-2 release 1.3 or greater, and Teradata DBC/1012, v4.1 or later. It also supports access via Apple's MacDFT along with Apple's Coax/Twinax, TokenTalk NB, or Serial NB cards. You can use TriData's Netway 1000 or 2000, Avatar's MacMainFrame, and DCA's MacIrma hardware and software products in place of Apple's 3270 products listed above. It also supports a synchronous connection via protocol converters.

The DAL Servers for MVS/TSO and MVS/V TAM are available through APDA.

To locate a vendor's address and phone number, use the vendor's name as a search string in the Tech Info Library.

PATHWORKS 1.0 & PageMaker: Problem Printing through VAXshare

=====

Article Created: 7 November 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I'm using PATHWORKS 1.0. I have difficulty printing PageMaker documents, especially ones with complex graphics, when using VAX/VMS print queues to spool Apple LaserWriter printers. I suspect this has something to do with the Aldus Prep PostScript dictionary file not being passed to the printer by PATHWORKS. Is there a workaround?

DISCUSSION -----

VAXshare Print Services in PATHWORKS is a component developed by Digital. Digital Customer Support Center (CSC) in Atlanta confirmed that they are aware of this problem, and that they already escalated it to Digital engineering.

DAL: Third-Party Servers

=====

Article Created: 14 November 1991  
Article Last Reviewed: 30 June 1992  
Article Last Updated:

TOPIC -----

I want to put servers on Apollo and Ultrix-based VAX workstations so Macintosh computers can access the data there. I need a list of current DAL servers.

DISCUSSION -----

The following are available from APDA:

Data Access Language Developer's Toolkit  
Data Access Language Server for VAX/VMS (9 track format)  
Data Access Language Server for VAX/VMS(TK 50 Format)  
Data Access Language Server for VM/CMS  
Data Access Language Server for MVS/TSO  
Data Access Language Server for A/UX v1.3  
Data Access Language Server for MVS/VTAM v1.3

Since you're looking for a DAL server for Ultrix and Apollo UNIX, the answer is very likely to come from Pacer.

Here is the latest information from the DAL Product Manager:

- Pacer Software announced a DAL Server for HP/UX, and DAL Server for SunOS on Sun SparcStation. Transport methods are TCP and Asynchronous. Databases supported are Ingres, Oracle, Informix, and Sybase.

They also have plans for DAL Server for Ultrix, and DAL Server for RS/6000 platform in early 1992.

- Novell is shipping on a DAL Server for Netware.

- Tandem is currently shipping DAL Server Tandem.
- Data General is working on a Server Product. Please contact directly for expected shipping date.
- Blyth Software is shipping DAL Toolkit for MS/DOS. AttachMate Software is required.

## DAL 1.3: Use With Different Oracle Process Names

Revised: 1/28/92  
Security: Everyone

DAL 1.3: Use With Different Oracle Process Names

=====

Article Created: 15 November 1991  
Article Last Reviewed: 29 June 1992  
Article Last Updated:

TOPIC -----

I tried to install DAL 1.3 for ORACLE V6 on a VAX/VMS system for an evaluation period. In the installation manual it says that the ORACLE V6 processes should have the following names: ORA\_DEMO\_RMON, ORA\_DEMO\_SMON. I can't imagine a lot of sites using these names for the ORACLE processes of their production database. In the installation notes I couldn't find the necessary commands to type if you have other ORACLE process names, in order to get DAL to work. Can you give me some guidelines? The VMS process names in this particular case are: ORA\_CIT\_RMON, ORA\_CIT\_SMON.

DISCUSSION -----

When you install ORACLE 6.x, you are asked to name an SID for the instance. An SID is an instance's unique identifier. It's a one-to-size character that identifies the new instance. Oracle uses this SID in the names of the processes associated with that instance.

These names, however, don't change the way you start DAL to use ORACLE. The examples in the Installation Guide used the name DEMO, but you can use any SID you like.

On the VAX, you still use "idal" to try a connection to the ORACLE demonstration database.

The example you saw in the Installation Guide shows you how to check for ORACLE DBMS status. No matter what your SID name is, you still use the \$ SHOW SYS command. These four processes should be in the list output by SHOW SYS.

If this doesn't work, access these tables using ORACLE's SQLPlus to

see if it works. If it doesn't, check your ORACLE installation, startup procedure, and privileges of the account you are using.

By the way, DAL 1.2 and 1.3 have problems with Oracle 6.0.33 (6.0.32 and before are OK) because ORACLE stops defining the logical name SYS\$ORACLE, which we need for DAL to work. To get around this, you can define the logical name for them in the MSAD\$LOGICALS file. You should define SYS\$ORACLE to be the value "ORA\_RDBMS" and then things should work.

The symptom for this is subtle. You can open up the DBMS, but any attempt to open up a database causes the connection to go away. So it looks like it might be a networking or AppleTalk for VMS problem. It's actually the DAL server dying, because it assumes that value exists when it doesn't.

Serial Printer: Connecting to UNIX Host Via Ethernet

=====

Article Created: 11 November 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I would like to print to our LaserWriter IINT via Ethernet from an SCO UNIX 3.2 computer. Is there a driver available to do this? Can this work for an ImageWriter II as well?

DISCUSSION -----

You can connect a LaserWriter IINT to a UNIX host with very little difficulty. But since the LaserWriter IINT has no Ethernet port, it's going to be very difficult to connect it directly to an Ethernet network.

You can, however, connect the LaserWriter IINT to a UNIX host via a serial connection. Then use the UNIX print spooler to allow other UNIX hosts on an Ethernet to print to the serially connected printer. You could use Adobe Systems' Transcript software to allow PostScript printing from the UNIX host. Or you could put the printer into Diablo 630 emulation mode and use it just like any ASCII printer.

You can connect the ImageWriter the same way. Of course PostScript style output would not be available, so the Transcript software won't be necessary.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

Security: Everyone

AppleTalk Remote Access: How to Copy It to an 800K System

=====

Article Created: 26 November 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I have a PowerBook 140, with AppleTalk Remote Access. I want to use this copy of Remote Access (on 1.4MB diskette) in my Macintosh SE, which has 800K diskettes. How can I get a copy of Remote Access on 800K diskettes if I have a version on 1.4MB diskettes? Do I have to buy a copy?

DISCUSSION -----

The license accompanying AppleTalk Remote Access allows a single user to make up to three copies of the AppleTalk Remote Access software for use on Apple computers they own and/or operate. You don't need to purchase another copy for your Macintosh SE.

To get a copy of the software for your Macintosh SE, (800K, two disks) we recommend the following:

- Get a copy from your dealer.
  - Copy the software to your PowerBook 140 and then do a "Live Install" on your Macintosh SE, over the network. The procedure below assumes you have an AppleTalk network in place between the PowerBook 140 and Macintosh SE, either with LocalTalk cabling, PhoneNet cabling, or serial cable (not supported by Apple).
- 1) Insert the AppleTalk Remote Access 1.4MB floppy into the PowerBook.
  - 2) Drag the Floppy Disk icon on top of the Hard Disk icon. This creates a folder on the PowerBook 140 called "Installer" with all of the AppleTalk Remote Access software within.

- 3) Open the Installer folder.
- 4) Rename the application inside from "Installer" to "Install".
- 5) Drag the files "Install" and "Remote Access Script" out of the Installer folder, to the root level of the hard disk (not the desktop).
- 6) Turn on File Sharing on the PowerBook.
- 7) From the Macintosh SE, use the Chooser to connect to the Macintosh PowerBook server. Sign on as the PowerBook owner. This gives you access to the entire PowerBook hard drive (that is, the PowerBook hard drive icon will appear on the Macintosh SE desktop).
- 8) From the Macintosh SE, open the PowerBook hard drive icon.
- 9) From the Macintosh SE, you should be able to see the "Install" application. Double click on it.

## DAL: Defining Oracle Image Identifier

Revised: 6/30/92  
Security: Everyone

DAL: Defining Oracle Image Identifier

=====

Article Created: 18 November 1991  
Article Last Reviewed: 30 June 1992  
Article Last Updated:

TOPIC -----

I have several instances of Oracle installed on my system. How does DAL know which one to look at?

DISCUSSION -----

The DAL Oracle database adapter, as supplied, is linked with the Oracle Image Identifier "S". If your installation selected a different image identifier, two assign statements must be supplied in either the system login file or the user's login file to point DAL to the correct Oracle images:

- Oracle 5.1.22

```
$assign/nolog device:[directory]ORACLEx.EXE ORACLES  
$assign/nolog device:[directory]ORACRTLx.EXE ORACRTLS
```

where "x" is the Oracle Image Identifier.

- Oracle 6.0

```
$assign/nolog device:[directory]ORACLEx.EXE ORACLES  
$assign/nolog device:[directory]ORACRTLx.EXE ORA_CRTLS
```

where "x" is the Oracle Image Identifier.

## LaserWriter IIg: Configure for Twisted Pair Ethernet (5/95)

Revised: 5/4/95  
Security: Everyone

LaserWriter IIg: Configure for Twisted Pair Ethernet (5/95)

=====

Article Created: 25 November 1991  
Article Reviewed/Updated: 4 May 1995

TOPIC -----

My Apple LaserWriter IIg does not appear in the Chooser. When I send a print job to the printer, the green light on the transceiver flashes, but the job times out and isn't printed.

I swapped the suspect Apple LaserWriter IIg with a known good one and had the same problem.

DISCUSSION -----

Check the push button switch on the back of the LaserWriter IIg, make sure it is set to 0 (zero) for AppleTalk Ethernet networks.

Also it appears you are connecting an Apple Twisted Pair Transceiver to a Farallon PhoneNet EN transceiver via RJ-45 cabling. Although the boxes are physically compatible, they are not logically compatible. The Apple Twisted Pair Transceiver is 10BaseT-compliant, but the Farallon PhoneNET EN is not.

The Apple Twisted Pair Adapter (part number M0845) is not the correct part. You need to use an Apple Ethernet AUI Adapter and power supply (part number M0432).

Here is the configuration:

Macintosh IICx with 3Com EtherLink card -----> Farallon PhoneNET EN ----->  
Farallon StarController EN (via RJ-45 cable) -----> Farallon PhoneNET EN (via  
RJ-45 cable) -----> Apple Ethernet AUI Adapter (M0432) -----> Power Supply and  
Apple LaserWriter IIg.

## A/UX: How to Back Up Installation Floppies

Revised: 11/10/92  
Security: Everyone

A/UX: How to Back Up Installation Floppies

=====

Article Created: 18 November 1991

### Article Change History

-----

08/31/92 - REVIEWED

- For technical accuracy.

### TOPIC -----

How can I use A/UX to make backup copies of my installation media? The floppies don't have Macintosh file systems on them, so regular Macintosh backup programs don't work.

### DISCUSSION -----

To clone an A/UX installation floppy, follow these steps:

1) Give the command:

```
dd if=/dev/floppy0 of=/tmp/floppy.image
```

This creates a file containing a copy of the floppy disk contents on the A/UX file system.

2) Insert the duplicate floppy and type:

```
dd if=/tmp/floppy.image of=/dev/floppy0
```

to move the copy of the A/UX file system to the new floppy.

As an alternative, you can make the backup copies under the Macintosh OS using a program like DiskCopy.

## AWS 95 & A/UX: Not Booting - yp: server not responding (4/95)

Revised: 5/23/95  
Security: Everyone

AWS 95 & A/UX: Not Booting - "yp: server not responding" (4/95)

=====

Article Created: 18 November 1991  
Article Reviewed/Updated: 21 April 1995

TOPIC -----

I have configured my A/UX system for bnet. When the system asked me if I wanted to be a NIS client, I respond with yes. Now, it does not boot.

DISCUSSION -----

When an A/UX system is configured to be a Yellow Pages client, it tries to connect to a Yellow Pages server during the boot process. If it cannot find a server, it displays the message yp: server not responding and the system waits until one becomes available.

One way to disable Yellow Pages is from the startup shell, by typing:

```
mv /etc/ypbind /etc/ypbind.hold
```

Then continue to boot normally. Once you have booted, we suggest that you turn off Yellow Pages in /etc/inittab and move the file back to the original location. To turn off Yellow Pages, find the line that executes ypbind and set it to off.

Another way is to edit the file /etc/inittab, using the ed editor from the A/UX Startup application.

Here is the process:

- 1) Launch A/UX Startup and click Cancel as it begins to launch A/UX.
- 2) At the startup# prompt, type: ed /etc/inittab
- 3) Use standard ed editing commands to change the line:  
  
. nfs2:2:wait:/etc/ypbind

. to:

. nfs2:2:off:/etc/ypbind

NOTE: For help with the ed editor, read the manual, "A/UX Text Editing Tools."

## How to Set up a Claris Folder (8/94)

Revised: 10/14/96  
Security: Everyone

How to Set up a "Claris" Folder (8/94)

=====

Article Created: 7 October 1991  
Article Reviewed/Updated: 4 August 1994

DISCUSSION -----

What is the Claris Folder inside my System Folder?

TOPIC -----

A Description of the Claris Folder:

Nearly all Claris applications can use the Claris XTND System for import & export of other file types. (XTND is also Claris Translators.) The Claris dictionaries are also used by nearly all Claris applications and are available in four languages in addition to US English.

This quick reference guide shows you how to set up a Claris folder in your System Folder. This allows all of your Claris applications to share the same Claris Translator files, as well as Claris dictionary files, saving space on your hard disk.

The latest versions of MacDraw Pro (1.0 or 1.5) and Claris Resolve (1.1) WILL automatically create a Claris folder and install the files which they use. They will not, however, install all of the files you may need.

Before You Install

- 
- Make sure you have access to the most recent versions of the Claris software.

Installing files into the Claris folder:

- 
1. Open the System Folder.
  2. Create a folder called Claris —with exactly those characters. Claris Folder, Claris f, or even putting spaces around Claris will cause Claris applications to FAIL to locate the folder.

3. Copy the Claris Translators folder from the MacWrite II Reference disk into the Claris folder.
4. Copy the Claris XTND System file to the Claris folder. (This file enables the Claris Translator folder.)
5. Copy the Main Dictionary and User Dictionary to the Claris folder.
6. Copy the Claris Help System to the Claris folder.
7. Copy any applicable help files to the Claris folder.

Help files come with all Claris products except MacPaint 2.0.

(Please remember that you need both the "Claris Help System" file - current version is 3.0v4, as well as any of the above help files.)

Claris Translators also work with ON Location 2.0.1 and Instant Update 1.0.1

Installing foreign language dictionaries:

-----  
Foreign Language Dictionaries are currently available for Claris applications in: British, French, Spanish, and German.

To install a foreign language dictionary:

1. Drag the appropriate dictionary and hyphenation files into the Claris folder. (Each foreign language dictionary has a separate hyphenation file.)
2. In your Claris application, choose Install Dictionaries... (From the Spelling menu in MacWrite II, from the Check Spelling hierarchical menu under the Edit menu in FileMaker Pro, Claris CAD and MacDraw Pro.)
3. Select the appropriate dictionary in the dialog box which appears. You're ready to begin spell checking!

Stationery/Options Documents:

-----  
A. Changing Default Settings:

In MacDraw Pro 1.0 & 1.5, MacWrite II 1.1, Claris CAD 2.0, and MacProject II 2.5; you can change any of the default settings such as: fonts, fonts sizes, headers, footers, custom styles (MacWrite II) rulers, pen sizes, artwork (MacDraw Pro 1.0 & 1.5, Claris CAD) and save them as a Stationery document. From now on, each time you open the specified application or create a new document, all of the customized settings will be the default settings. The following procedure explains how this is done.

1. Select New from the File menu.
2. Change any of the default settings to those you routinely use. (i.e., customize the menus, change the pattern palette, etc.)
3. Add any graphics, such as a letterhead or logo, that routinely appear in your documents.
4. Choose Save As from the File menu.
5. Type in the filename "<application name> II Options" and click Stationery. (<Application name> equals one of the following: MacWrite II Options, MacDraw Pro Options, Claris CAD Options, etc.)

6. Select either the System Folder, or the Claris folder within the System Folder, or the folder that contains the given Claris application as the folder in which you want to save this file.
7. Click Save.
8. Choose quit from the File menu.

B. Temporarily Disabling Your Custom Default Options:

1. Hold down the option key while starting the given application and it will not look for your startup file in the System Folder.
- OR ...
2. When choosing New from the File menu in your application, hold down the option key. This will bring up a blank document.

Specific Application Notes:

-----  
MACWRITE II 1.1: Using MacLink Plus Bridge  
-----

MacWrite II users can order an additional set of file translators containing many more PC and mainframe application file formats from DataViz, Inc., 35 Corporate Dr., Trumbull, CT 06611; 203-268-0030. \$169 retail

In order to use the additional translator files, follow the installation procedure below:

1. Copy the MacLink Plus Bridge file from the MacWrite II Program disk into either the Claris folder, or the Claris Translators folder.
2. If present, the DataViz MacLink Plus/Translators file should be in the Claris folder. PLEASE NOTE: IF THE MACLINK PLUS/TRANSLATORS FILE IS IN THE CLARIS TRANSLATORS FOLDER, IT WILL NOT BE READ.

To see the full range of XTND filters in MacWrite II

-----  
If the Open... and Save As... dialog boxes in MacWrite II do not display all the XTND filters in the pop up menu, try doing an "Insert File" (command-shift-i). Typically, this option will show all the XTND filters available when the pop-up is clicked.

FileMaker Pro/MacDraw Pro: Additional Claris Translator files  
-----

In order to ensure that these new versions can read and write needed file formats, make sure the Claris Translators files from the FileMaker Pro/MacDraw Pro disks are copied into your Claris folder, as well as the Help documents, if you wish to use help inside these applications.

Current Claris Translator Files:

-----  
(Excludes MacLink Plus/Bridge files purchased from DataViz, as well as native formats, such Stationery, Text, Tab Text, Comma Separated Text, etc.)

(Also excludes ClarisWorks translators, which are a single 100k file, version 1.0v3; and Claris Resolve translators, which reside inside the application.)

- Current version of Claris XTND file is 1.3

If You don't want to use the Claris folder:

-----  
There are several other options for you if you don't want to create a Claris folder in your System Folder. Although the Claris folder approach is recommended, here are some alternatives:

- The Claris Translators folder in the root(top) level of the System Folder.
- The Claris Translators folder in the same folder as MacWrite II 1.1.
- Claris Application (Stationery) Option Files: Select either the System Folder, or the folder that contains the given Claris application, as the folder in which you want to save this file.
- Main Dictionary and User Dictionary files: the folder that contains the given Claris application as the folder in which you want to save this file.
- Help System and Help Document files: the folder that contains the given Claris application as the folder in which you want to save this file.

DAL 1.2: Current Release Runs under TSO

=====

Article Created: 22 February 1991  
Article Last Reviewed: 30 June 1992  
Article Last Updated: 20 June 1992

TOPIC -----

Does a DAL Server on an IBM mainframe run in its own address space or does it run under TSO?

DISCUSSION -----

Data Access Language Server for MVS/TSO runs under TSO and uses a TSO session for each user. Data Access Language Server for MVS/VTAM (available from APDA) runs in its own address space or a Batch job or Started Task, and allows access through CICS and VTAM directly with no TSO overhead.

Apple IIe Card: Control Panel vs. Option Panel

=====

Article Created: 6 June 1991  
Article Last Reviewed: 3 June 1992  
Article Last Updated:

TOPIC -----

How do the Macintosh Control Panel and the Apple IIe Option panel relate to each other?

DISCUSSION -----

They are separate. Printers, keyboard, mouse, and other Macintosh settings have no effect on the IIe side. The only setting that affects the IIe Option Panel is the Monitors setting in the Macintosh. If the Macintosh is set to black and white, the Apple IIe Card only displays black and white data.

Apple IIe Card: Sound Level Control

=====

Article Created: 6 November 1991  
Article Last Reviewed: 3 June 1992  
Article Last Updated:

TOPIC -----

How do I control the Apple IIe Card sound level?

DISCUSSION -----

You can control sound either from the Macintosh side or from the Apple IIe Card software:

- From the Macintosh Control panel, you can slide the speaker volume control from seven (loudest) to zero (silence), thus altering the volume of the beep.
- From the Apple IIe Card Option panel, you can change the type of "beep" the computer makes, but you cannot change the volume level.

Neither the Macintosh nor the Apple IIe Card can control the sound(s) that an application makes. For example, computer and card panel settings will not affect a music program or a game's sound effects.

## Disk Copy 4.2: How to Install and Use (2/97)

Revised: 2/12/97  
Security: Everyone

Disk Copy 4.2: How to Install and Use (2/97)

Article Created: 7 October 1991  
Article Last Reviewed: 12 February 1997

TOPIC -----

Disk Copy 4.2 is a utility program that transfers image files onto 3.5-inch floppy disks, whether 800K or High Density. (A High Density, also called FDHD, disk holds 1.44MB.)

DISCUSSION -----

Increasing Memory Allocation (for High Density images)  
-----

If you are reading High Density images, follow these steps to increase the memory allocation for Apple Disk Copy to 1600K:

Step 1:  
Select the Apple Disk Copy 4.2 icon.

Step 2:  
From the File menu, choose Get Info (or press Command-i).

Step 3:  
In the Current Size box, type 1600.

Step 4:  
Close the Get Info window.

Step 5:  
Launch Apple Disk Copy 4.2 and proceed with Step 3 in the following section, "Apple Disk Copy 4.2: Installation and Use".

Apple Disk Copy 4.2: Installation and Use  
-----

To install and use Apple Disk Copy 4.2, follow these steps:

Step 1:

Copy the Disk Copy 4.2 folder to your hard drive.

Step 2:

Open the Disk Copy 4.2 folder and double-click the Disk Copy icon.

Step 3:

The title screen appears; click the mouse to continue.

Step 4:

The main screen appears; click the Load Image File... button. (You can also select Load Disk Image from the File menu or press Command-L.)

Step 5:

Choose the image file you want to copy to floppy disk.

Step 6:

Click the Open button. A message appears: "Reading the master disk image into memory..." After the image is loaded into memory, the Make A Copy button is highlighted.

Step 7:

Click the Make a Copy button and a prompt appears: "Please insert a disk to COPY ONTO..."

Step 8:

Insert a floppy disk (formatted or unformatted) into the main floppy drive. This message appears: "Now copying and verifying a disk..."

If there is already data on the disk, a beep sounds and a dialog box appears. If it is okay to write over the disk, click the Duplicate button. Otherwise, click the Eject button. If you eject the disk, the main screen reappears. Click the Make A Copy button again and insert a different disk.

When the image file has been transferred to the floppy disk, the disk automatically ejects.

Step 9:

For each image file you want to put on floppy disk, repeat steps 4-8. When you are finished, click the Quit button. (You can also select Quit from the File menu or press Command-Q.)

Hints and Help

-----  
To launch Apple Disk Copy 4.2 and load the image file into memory at the same time, double-click the image file icon.

If you want to learn more, read the "Disk Image Directions" document in the Apple Disk Copy 4.2 folder.

Other Disk Copy Features

-----  
--Making copies directly from a floppy disk. To copy the contents of a master

disk onto one or more other disks, take the following steps:

- 1) Choose Single Copy or Multiple Copies from the File menu.
- 2) Insert a master floppy disk to copy from into the floppy disk drive.
- 3) Click Read Master Floppy to read the contents of the master disk.
- 4) When the image file is loaded, click Make A Copy to start copying. (If you are making multiple copies, this button is labeled Make Some Copies.)
- 5) Insert a blank disk in the floppy disk drive to receive the newly created disk contents. When the wristwatch pointer changes back to the arrow pointer, disk creation is complete. If you are making multiple copies, insert each blank disk in turn.

--Creating an image file for later use

You can store an image file on your hard disk and use it to create duplicate floppy disks. Follow these steps to put an image file of a floppy disk on your hard disk:

- 1) Insert the floppy disk that you want to duplicate into the floppy disk drive.
- 2) Click Read Master Floppy.
- 3) After the contents of the floppy disk have been read, choose Save Disk Image from the File menu.
- 4) In the window provided, give the image file a name, and click Save.

## Before Installing System 7.1 (10/94)

Revised: 10/27/94  
Security: Everyone

Before Installing System 7.1 (10/94)

Article Created: 8 November 1991  
Article Reviewed/Updated: 27 October 1994

TOPIC -----

This quick reference shows you what to do before installing System 7.1 software. It includes:

- Backing up your hard disk
- Running Compatibility Checker
- Updating hard disk drivers
- Where to get more information

DISCUSSION -----

### Backing Up Your Hard Disk

Back up your entire hard drive. If you can't do this, at least make a backup copy of your System Folder. To do this:

- 1) Click the System Folder once to select it.
- 2) From the File menu, choose Duplicate or press Command-D.
- 3) Save the duplicate System Folder to another hard disk, to floppies, or to tape backup as an added measure of security.

### Running Compatibility Checker

Compatibility Checker 2.0 is a stand-alone application. To run it, simply do the following:

- 1) Copy the Compatibility Checker 2.0 application to your hard disk.

- 2) Double-click the Compatibility Checker icon to launch the application.
- 3) The Welcome window appears. Click the continue button at the bottom right side of the window.
- 4) A dialog box appears with a listing of currently available disks marked by selected check boxes. Click the OK button if you want Compatibility Checker to scan all of your hard disks, otherwise click the check boxes to deselect any hard disk(s) you do not want to scan. Compatibility Checker scans your hard disk. Progress is marked by a modal dialog box, similar to the Copy dialog box in the Finder
- 5) If Compatibility Checker finds potentially incompatible items, a screen appears.
- 6) Click one of the two buttons at the bottom of the screen. If you click the Move button, the items will be moved to a folder on top level of the hard disk named "May Not Work With System 7.1." In either case, the Compatibility Report window will appear.
- 7) Use the Sections menu, as shown below, to navigate around the report. (It's best to print the report and use it as a guide to update your software if necessary.)
- 8) When you're finished with Compatibility Checker, click the Quit button. A dialog box appears, asking if you want to save the report.
- 9) After you've chosen whether or not to save the report, the a dialog box appears, notifying you that any items Compatibility Checker moved out of your System Folder are still active until you restart your Macintosh.
- 10) Review the report, following the instructions detailed in it. Remember, individual vendors are the best sources of information, please contact them directly if you have any questions.

#### Checking Hard Disks With Disk First Aid

-----

Disk First Aid can detect and repair any problems that your Apple supplied hard disk(s) might have before installing system 7.1. Specifically, Disk First Aid 7.1 can detect and repair any occurrence of the "disappearing folders and files bug" which System 7 Tune-Up prevents, but cannot repair. Previously, the only course open to users was to re-initialize their hard disk.

- 1) Disable any virus or security software.
- 2) Start up with the Disk Tools disk. To do this, turn on your Macintosh. If your Macintosh is already on, select Restart from the Special menu.
- 3) Put the Disk Tools disk in the main floppy drive right after you hear the chime. The Disk Tools disk icon appears in the upper right corner of the desktop.

If disk icon does not appear, select Restart from the Special menu.  
The disk will eject, simply pop it back into the drive immediately.

- 4) Double-click the Disk Tools icon. A dialog box appears.
- 5) Double-click the Disk First Aid icon. A dialog box appears.
- 6) Click the Drive button in dialog box to select your (first) hard disk.  
Click the Open button. A Disk First Aid window appears.
- 7) Click the Start button. If no problems are found, the message: "This disk is OK" appears. Skip to step #9.
- 8) If damage was found, click the repair button. When repairs are completed, go to step #10. If repairs are unsuccessful, you'll need to back up the disk, then re-initialize the disk with HD SC Setup.
- 9) Repeat for any additional hard disks. Choose Open from the File menu and repeat steps #5 through #7.
- 10) Choose Quit from the File to return to the Finder.

#### Updating Hard Disk Drivers

-----

Drivers are small programs that tell your hard disk how to interact with your Macintosh. You must update these drivers on your Apple hard disk(s) before installing System 7.0. To update your drivers, follow these steps:

- 1) Disable any virus or security software.
- 2) Start up with the Disk Tools disk. To do this, turn on your Macintosh.  
If your Macintosh is already on, select Restart from the Special menu.
- 3) Put the Disk Tools disk in the main floppy drive as soon as you hear the chime. The Disk Tools disk icon appears in the upper-right corner of the desktop -- if it doesn't, select Restart from the Special menu.  
When the disk ejects, pop it back into the drive immediately.
- 4) Double-click the Disk Tools icon.
- 5) Double-click the Apple HD SC Setup icon.
- 6) Click the Update button. A message appears.
- 7) Click the Quit button.

You are now ready to install System 7.0 software. Refer to the "Quick Reference: How to Install System 7.0" for instructions.

## How to Connect to File Servers (2/95)

Revised: 2/23/95  
Security: Everyone

How to Connect to File Servers (2/95)

Article Created: 8 October 1991  
Article Reviewed/Updated: 23 February 1995

TOPIC -----

This article gives basic instructions on how to work with file servers or "shared disks" as they are also called. Its topics include:

- Connecting to file server (shared disk)
- Logging on as a guest
- Logging on as a registered user
- Setting your password
- System 7.0 hints and help
- Where to get more information

DISCUSSION -----

Connecting to a File Server (Shared Disk)

Follow these steps to connect to a file server:

Step 1

From the Apple menu, select Chooser. The Chooser window appears.

Step 2

Click the AppleShare icon in the upper-left part of the Chooser window.

Step 3

Scroll the list of AppleTalk Zones to find the one you want.

Step 4

Click the name of the AppleTalk Zone to select it. A list of shared disks (also called file servers) in that zone appears in the right-hand window.

Step 5

To select a shared disk, click its name.

Step 6

Click the OK button (or you can double-click the shared disk name, which does the same as steps 5 and 6).

Step 7

Click the Guest or Registered User radio button. Read the instructions that follow for the radio button you've chosen.

Logging on as a Guest

-----  
If Guests are allowed to log on, the word Guest appears in regular type. If Guests are not allowed, the word Guest appears dimmed (grayed out). Follow these steps to log on as a guest:

Step 1

If you want to log on as a Guest, and Guests are allowed, click the Guest radio button.

Step 2

Click the OK button to see the volume list.

Step 3

If the name of the volume is not already selected, click it.

Step 4

Click the OK button and the shared disk (server) icon appears on your desktop.

When you're finished with the shared disk, drag its icon into the Trash.

Logging on as a Registered User

-----  
Follow these steps to log on as a registered user:

Step 1

If you are a Registered User, click the Registered User radio button.

Step 2

Type your name and password.

Step 3

Click the OK button to see the volume list.

Step 4

If the name of the volume is not already selected, click it.

Step 5

Click the OK button, and the shared disk (server) icon appears on your desktop.

When you're finished working with the shared disk, drag its icon to the Trash.

Setting Your Password

-----  
If you are a Registered User, you need to set up your Password initially and occasionally change it. Here's how:

Step 1

Follow steps 1-6 of Connecting to a Shared Disk.

Step 2

Click the Set Password button.

Step 3

Click the OK button, and a dialog box appears.

Step 4

Type your old password.

Step 5

Press the Tab key.

Step 6

Type your new password.

Step 7

Click the OK button (or press Return).

Step 8

Click the OK button (or press Return).

Step 9

Type your new password again.

Step 10

Click the OK button (or press Return). Your password is changed.

System 7.0 Hints and Help

- 
- To move between sections of the Chooser, press the Tab key.
  - To move to an item quickly within any section of the Chooser, type one or more characters that begin the name of the desired item.

## How to Connect to Network Printers (7/96)

Revised: 7/1/96  
Security: Everyone

How to Connect to Network Printers (7/96)

=====

Article Created: 8 October 1991  
Article Reviewed/Updated: 01 July 1996

TOPIC -----

This article covers these topics:

- Basic preparations for networking and background printing
- Connecting to network printers
- Selecting background printing
- System 7.x hints and help
- Where to get more information

DISCUSSION -----

Before You Connect

-----

To connect to network printers, you need the following items installed in the System Folder:

- LaserWriter or LaserWriter 8 (With LaserWriter 8 Print Driver you also need the PPD files from the installer disk.)
- LaserWriter Prep (under System 6.0.x only)

To use background printing, PrintMonitor also must be installed in the System Folder (under System 7.x, in the Extensions folder within the System Folder). If you need to install any of these items, use your set of system disks to do so. Under System 7.x, use the copy of the Installer on the Printing disk.

Connecting to Network Printers

-----

Follow these steps to connect to network printers:

- 1) From the Apple menu, select Chooser. The Chooser window appears. AppleTalk must be set to Active in the lower-right part of the Chooser window.
- 2) In the upper-left part of the Chooser window, click the icon of the type of printer you want (this must be a network printer, for example LaserWriter).
- 3) Scroll the list of AppleTalk Zones to find the one you want.
- 4) Click the name of the AppleTalk Zone to select it. A list of printers and print spoolers in that zone appears in the right-hand window.
- 5) Click on the name of a printer or print spooler to select it. If you use LaserWriter 8, you must click the "Setup..." button and setup the printer. You may either use Auto Setup, or chose More Choices to select a specific PPD.
- 6) From the File menu, select Close, or click on the close box in the upper-left corner of the Chooser window.

#### Selecting Background Printing

-----

With PrintMonitor, you can print on a LaserWriter while continuing to work with other programs (this is called background printing). Follow these steps to select background printing:

- 1) From the Apple menu, select Chooser. The Chooser window appears.
- 2) Click the LaserWriter icon in the upper-left part of the Chooser window.
- 3) Click the On radio button in the Background Printing section (below the list of LaserWriters).
- 4) From the File menu, select Close, or click on the close box in the upper-left corner of the Chooser window.

#### System 7.x Hints and Help

-----

- To move between sections of the Chooser, press the Tab key.
- To move to an item quickly within any section of the Chooser, type one or more characters that begin the name of the desired item.

#### Where to Get More Information

-----

- Macintosh Networking Reference by Apple Computer, Inc. (030-3936-A)
- Macintosh Reference (System 6.0.x) by Apple Computer, Inc. (030-4015-A)

- Macintosh Reference (System 7) by Apple Computer, Inc. (030-3934-A)

## Creating Font/DA Backups Under System 6 and System 7 (10/94)

Revised: 6/5/96  
Security: Everyone

Creating Font/DA Backups Under System 6 and System 7 (10/94)

Article Created: 6 December 1993  
Article Reviewed/Updated: 17 October 1994

TOPIC -----

In the event that the Macintosh System file gets corrupted, you could lose some or all of your fonts under versions of System 7 earlier than 7.1, or some or all of your fonts and DAs under System 6.0.x. So it's a good idea to create font/DA backup files. The following instructions show you how to do this.

DISCUSSION -----

CREATE EMPTY SUITCASE FILES WITH VERSIONS OF SYSTEM 7

-----  
If your Macintosh has a version of System 7 installed, follow these steps to create an empty suitcase:

- 1) Click an existing font suitcase file to select it.
- 2) Choose Duplicate from the File menu, or press Command-D.
- 3) Double-click the duplicate file to open it.
- 4) Drag the contents to the Trash.
- 5) Choose Empty Trash from the Special menu.
- 6) Duplicate this empty suitcase as many times as you need.

CREATE FONT BACKUPS WITH SYSTEM 7.0

-----  
This section explains two ways to create font backups under System 7.0 or 7.0.1.

Copy to Another Folder

-----

- 1) Choose New Folder from the File menu.
- 2) Type a name for the folder (Font backup folder, for example).
- 3) Double-click the System Folder to open it.
- 4) If you want to back up your entire System file (fonts and sounds), hold down the Option key, then click and drag the System file to the folder you created. Your System file is copied (not moved) to that folder.
- 5) If you want to back up only some of the fonts, double-click the System file to open it. A window appears, displaying individual fonts installed in the System.
- 6) Select the fonts you want to copy by using either the selection rectangle or Shift-clicking.
- 7) Hold down the Option key and drag the font files to the folder you created. The fonts are copied (not moved) to that folder.

#### Copy to a Suitcase

-----

- 1) Double-click the System Folder to open it.
- 2) Double-click the System file. A window appears, displaying individual fonts installed in the System.
- 3) Select the fonts you want to copy to the backup file, by either the selection rectangle or Shift-clicking.
- 4) Hold down the Option key and drag the fonts to one of the empty suitcases you created. Your fonts are copied (not moved) to the suitcase file.

#### CREATE DA BACKUPS UNDER SYSTEM 7

-----

#### Copy to a Folder

-----

- 1) Choose New Folder from the File menu (or press Command-N).
- 2) Type a name for the folder (DA backup folder, for example).
- 3) Double-click the System Folder to open it.
- 4) To back up your entire Apple Menu Items folder, hold down the Option key, then click and drag the Apple Menu Items folder to the folder you created. Your Apple Menu Items folder is copied (not moved) to that folder.
- 5) To back up only some of the DAs, double-click the Apple Menu Items folder to open it. A window appears, displaying individual DAs installed

- 6) Select the DAs you want to copy by either the selection rectangle or Shift-clicking.
- 7) Hold down the Option key and drag the DA files to the folder you created. The DAs are copied (not moved) to that folder.

#### CREATE FONT/DA BACKUPS WITH SYSTEM 6.0.X

-----

- 1) If you don't already have Font/DA Mover 4.1 on your hard drive, copy the application to your hard drive before proceeding.

NOTE: If you have older versions of Font/DA Mover on your hard drive, drag them to the Trash. Using an older version can damage your System file!

- 2) Double-click the Font/DA Mover application. The Font/DA Mover screen appears. The left-hand scroll box shows the fonts currently installed in your System file. The title below the scroll box shows the location of the fonts.
- 3) Click the right-hand Open... button. A standard file selection dialog box appears.
- 4) Click the New button. A dialog box appears so you can name the new file.
- 5) Type the name of the new file. Click the Create button. You are taken back to the Font/DA Mover screen.
- 6) Select the fonts you want to back up by dragging over the list (or you can hold down the Shift key and click each font). The selected fonts are displayed in reverse type (white letters on a black background). Arrows appear on the Copy button to show the installation direction.
- 7) Click the Copy button.  
To create a backup file of desk accessories during the same session, click the Desk Accessory radio button. The left-hand scroll box then shows the DAs currently installed in your System file. Follow steps 3-7, substituting DA(s) wherever you see font(s).
- 8) When you're finished, click the Quit button to go back to the Desktop (Finder).

#### 6.0.x Hints and Help

-----

Hold down the Option key before launching Font/DA Mover 4.1 to display DAs first rather than fonts.

## Quick Reference: Font/DA Mover for System 6.0.x

Revised: 7/17/92  
Security: Everyone

Quick Reference: Font/DA Mover for System 6.0.x

Article Created: 17 October 1991  
Article Last Reviewed: 1 June 1992  
Article Last Updated:

TOPIC -----

Font/DA Mover is a utility that installs fonts and desk accessories (DAs) in your System file. Once installed, you can use these fonts and desk accessories with any application. This quick reference covers:

- Installing Font/DA Mover
- Using Font/DA Mover
- Hints and help
- Where to get more information

Important: Make sure you use Font/DA Mover 4.1. If you have older versions of Font/DA Mover on your hard drive, drag them to the Trash. Using an older version can damage your System file.

Note: You don't need Font/DA Mover at all if your Macintosh is running System 7.0 or later.

DISCUSSION -----

Installing Font/DA Mover

-----  
To install Font/DA Mover, copy the Font/DA Mover 4.1 application to your hard drive. You may want to keep it in the folder where you keep your other utility programs. (You don't need to keep it in your System Folder.)

Using Font/DA Mover

-----  
The steps below show you how to install fonts. The same steps apply to installing DAs. Follow these steps:

1) Double-click the Font/DA Mover application.

Once Font/DA Mover is launched, you'll see two boxes. The left one shows the fonts currently installed in your System file.

2) Click the Open... button on the right side to go to the fonts you want to install. A standard file selection dialog box appears.

3) Find the font file with the fonts you want to install, select it, and click the Open button (or press Return). You'll be taken back to the Font/DA Mover dialog box. Its window shows the contents of the font file selected for installation.

4) Select the fonts you want to install by dragging over the list on the right (or you can Shift click each font size). When you've selected the fonts, their names appear in white letters on a black background. The Copy button highlights automatically. Arrows on the button show the direction in which you're installing.

5) Click the Copy button to install the fonts. If you're in MultiFinder, you'll get a message saying that the fonts and DAs installed.

6) Click the OK button.

7) When you're finished, click the Quit button to return to the desktop (Finder). If you're in MultiFinder, restart your Macintosh.

To install desk accessories during the same session, click the Desk Accessory radio button. The left scroll box then shows the DAs currently installed in your System file. Follow steps 3-6, substituting the word "DA(s)" wherever you see "font(s)" in the instructions.

#### Hints and Help

-----

To display DAs first, rather than Fonts, hold down the Option key while launching Font/DA Mover.

#### Where to Get More Information

-----

If you want to explore more, read The Macintosh Bible, Third Edition, pages 483-486.

## AppleShare Print Server: Error -120 Is directory not found

Revised: 12/11/91  
Security: Everyone

AppleShare Print Server: Error -120 Is "directory not found"

=====

Article Created: 29 March 1991  
Article Last Reviewed:  
Article Last Updated: 7 November 1991

### TOPIC -----

I am having problems with an AppleShare Print Server IINTX. When any of the workstations try to print to the network LaserWriter, the print server instantly aborts the print job. After this, the printer must be reset to be re-captured.

A message comes up on the screen stating that the computer is trying to clear the print buffer. I also get a message stating that error number -120 has occurred.

### DISCUSSION -----

The -120 error is a "directory not found" error that could relate to a hardware failure on the server. If you can print to the LaserWriter IINTX via the bypass feature of the AppleShare Print Server, then there is a problem at the server level. It is most important to determine that the workstations can print to the LaserWriter IINTX on bypass to verify the integrity of the hardware.

Here are two things to try on the server:

- 1) If you reinstalled the software over the old files, trash the old files first, then re-install.
- 2) Consider backing up the server in a file-by-file manner, re-initializing the drive, and restoring the files. The print server may be running into some bad sectors which inhibit its ability to spool the files.

## System 7: Application Cannot be Found Error/Fix (11/94)

Revised: 11/11/94  
Security: Everyone

System 7: Application Cannot be Found Error/Fix (11/94)

=====

Article Created: 2 October 1991  
Article Reviewed/Updated: 11 November 1994

TOPIC -----

I have been using System 6 on my Macintosh and putting my applications on the Desktop (as opposed to within any folder). After installing System 7, I rebuilt the Desktop and "lost" these applications. However, they appeared again in their correct place, when I opened the hard disk icon.

The problem is that when I try to open a document created by any one of these applications, I get an error message that says, "The application cannot be found."

DISCUSSION -----

The fix is to move the application to the hard disk window. Then, if you want, move it back to the Desktop. This seems to "force" the Finder to update the Desktop correctly.

## LaserWriter IIf & IIg: PhotoGrade, RAM, and Image Size (3/95)

Revised: 3/21/95  
Security: Everyone

LaserWriter IIf & IIg: PhotoGrade, RAM, and Image Size (3/95)

Article Created: 26 November 1991  
Article Reviewed/Updated: 21 March 1995

TOPIC -----

When we print to the LaserWriter IIg, there is a half-inch margin around the outside of each page. We've been printing closer to the edge of the page with the LaserWriter IINT and IINTX. How can we adjust this on the LaserWriter IIg?

DISCUSSION -----

These margin differences are caused by the memory requirements of PhotoGrade. The LaserWriter IIg defaults to using PhotoGrade enhancement unless told otherwise. Because a letter-size image -- with PhotoGrade enabled -- needs a frame buffer four times larger than an unenhanced image, the LaserWriter reduces the image size as required. It reduces a letter-size buffer, which would use 3935376 bytes, to a lettersmall buffer that uses 3511296 bytes. This can lead to the cropping of images when printing with non-Apple drivers (as on a Sun workstation), since the printer will crop any part of the image that falls within the larger margins.

As shipped, the LaserWriter IIg has only enough memory for an a4small frame buffer with PhotoGrade enhancement. Without PhotoGrade enabled, it can easily handle a full legal-sized image, but must be explicitly instructed to do so. You can do this in a couple of ways:

- Disable Photograde

If the PostScript operator for the required page size is included in the print job, the LaserWriter will disable PhotoGrade to maintain compatibility.

- Modify the Default Parameter

You can modify the persistent parameter that forces the PhotoGrade default. This is probably not a good idea unless you find it easier than modifying the printing code. It is inconvenient, and modifies the persistent memory. You can modify the persistent memory a limited number of times before it wears out.

To request a specific page size and override PhotoGrade, include a reference to the required page size in the beginning of the print job. The different page size operators are listed below, along with their memory requirements with and without PhotoGrade enhancement.

| Page Size   | PhotoGrade |         |
|-------------|------------|---------|
|             | Off        | On      |
| -----       | -----      | -----   |
| b5          | 741888     | 2967552 |
| lettersmall | 877824     | 3511296 |
| a4small     | 924420     | 3697680 |
| letter      | 983844     | 3935376 |
| a4          | 1015872    | 4063488 |
| legal       | 1257344    | 5029376 |

If you print a job with no requested page size, the LaserWriter IIf and IIg use the default size of lettersmall. If the job specifies a size, the LaserWriter will try to honor it as closely as possible within its memory limitations. The following table depicts the page size substitution order.

#### Frame Buffer Substitution Order

-----  
lettergray -> lettersmallgray -> letter -> lettersmall  
legalgray -> legal -> lettersmall  
a4gray -> a4smallgray -> a4 -> a4small  
b5gray -> b5

With the Apple LaserWriter IIf as shipped with 2MB, a request for a letter-size frame buffer results in a lettersmall buffer, the default. Requesting an a4 page results in an a4small buffer. The next table shows the maximum page size available for each memory configuration.

| MB | Largest Page Size            |
|----|------------------------------|
| -- | -----                        |
| 2  | a4small, PhotoGrade disabled |
| 4  | legal, PhotoGrade disabled   |
| 5  | a4small, PhotoGrade enabled  |
| 8  | legal, PhotoGrade enabled    |

In summary, prepending the letter operator to the documents would be adequate. Or you can disable PhotoGrade one time, and leave it alone until you need it again later. Note that the non-volatile RAM used in both the LaserWriter IIf and IIg has a limit to the number of times it can be modified: approximately 50000 writes. While this is a large number, you could rapidly exceed it if the modification were sent with each page or job. Once this part wears out, the factory defaults will be used each time the LaserWriter is powered on.

The following three code segments show, respectively:

- The letter operator at the start of a job
- Code to disable PhotoGrade
- Code to enable PhotoGrade

Caution:

-----

If you choose to use the PostScript code provided in this article, you assume all risks involved in making these changes. PostScript code, if not entered correctly, can place the LaserWriter into a condition requiring service.

- code segment 1

```
%=====
% Begin PostScript Code
%
%some sample PostScript with the letter operator prepended
letter
/Helvetica findfont 12 scalefont setfont
72 720 moveto
(This is a test) show
%
% end PostScript Code
%=====
```

- code segment 2

```
%=====
% Begin PostScript Code
%
%Disable PhotoGrade.ps      D.W.  11/91
%This code disables PhotoGrade enhancement after a couple of checks:
% Verifies that it's running on a LaserWriter IIg or IIIf.
% Checks if PhotoGrade is already disabled - prevents NVRAM fatigue.
% (The memory device is limited to approximately 50000 writes.)
statusdict /product get dup
(LaserWriter IIIf) ne exch (LaserWriter IIg) ne and
{ (Not a IIIf or IIg and may not support PhotoGrade.  Canceling.) =
  stop
} if

## LaserWriter IIf and IIg: Changing Passwords

Revised: 12/13/91  
Security: Everyone

LaserWriter IIf and IIg: Changing Passwords

=====

Article Created: 26 November 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

How do I change passwords on the LaserWriter IIf and IIg?

DISCUSSION -----

Because the LaserWriter IIf and IIg use implementations of Level 2 PostScript, setting their passwords is a bit different from previous models. This is primarily because Level 2 uses two different passwords -- one to secure system parameters, and another to secure use of the startjob operator. You will probably want to change both. This will achieve similar functionality to the Level 1 setpassword operator. Here is sample code to change both passwords:

```
<</Password (0) /StartJobPassword (2)>> setsystemparams  
<</Password (0) /SystemParamsPassword (2)>> setsystemparams
```

In both cases, the string following the /Password name must equal the current SystemParamsPassword. This password is required in order to change either the StartJobPassword or the SystemParamsPassword. Once these two have been redefined, the level of security is identical to that available through the setpassword operator in a Level 1 implementation. The two passwords need not be equal, and can be strings of up to 32 non-null characters. You can use an integer instead (as with Level 1), but internally it will be converted to a string containing the ASCII representations of each digit. Here is a version of the above code that changes both passwords, each to a different integer.

```
<<                                %Push a mark on the stack.  
/Password 0                       %Push key/value pairs for current password,  
/StartJobPassword 2              %the new StartJobPassword, and the new
```

```
/SystemParamsPassword 4  %SystemParamsPassword on the stack.  
>>                        %Create dictionary of the kv pairs up to mark.  
setsystemparams          %Use the dictionary to set system params.
```

Once this is sent, the value 4 or string (4) will be required as a password to change settings.

Level 2 introduces many new concepts to the PostScript world, and a complete discussion of how these work is best left to manuals on the subject. The current reference is available from Addison Wesley as the PostScript Language Reference Manual, 2nd Edition, by Adobe Systems Incorporated.

On AppleLink, you can find contact information for the various vendors by clicking the Library Index button to view the folder structure in the Tech Info Library. An alphabetic listing of vendors is in the Third Party Company Directory folder.

## Macintosh Quadra 700, 900 & 950: SCSI Termination Issues 1/93

Revised: 1/26/93  
Security: Everyone

Macintosh Quadra 700, 900 & 950: SCSI Termination Issues 1/93

=====

Article Created: 16 December 1991

### Article Change History

-----

01/26/93 - UPDATED

- To include Quadra 950.

08/21/92 - UPDATED

- Clarified how to get internal SCSI terminator for Quadra 700

### TOPIC -----

This article addresses SCSI termination issues with the Macintosh Quadra 700, 900 and 950 computers.

### DISCUSSION -----

What is SCSI?

SCSI (Small Computer System Interface) is a standard by which one connects a device to the CPU. This device can be an external hard drive, CD ROM, Printer, Scanner, etc. The SCSI bus needs to be terminated at both ends to eliminate signal reflections.

How is the Quadra 700 Terminated?

With an internal hard disk drive, there are termination resistors on the drive itself. This would terminate the internal end of the bus.

If the internal hard drive is removed, a internal SCSI terminator must be installed (Apple Part Number 630-0408). This part was originally designed for the Macintosh Classic computer and a service provider can locate this part listing in the Macintosh Classic section of the Service Source CD, Technical Procedures or Macintosh Service Guide book. Apple US Service Administration can help a service provider order this part by overriding the standard

minimum order.

Floppy only system: Apple will install a plug-in terminator (Apple Part Number 630-0408) into the internal SCSI connector on the motherboard; thereby terminating one end of the bus as an internal drive would do. As external devices are added the last device should have an external terminator installed (Gray Terminator, Apple Part Number 658-8032). This way the bus is terminated at both ends.

How is the Quadra 900 and Quadra 950 Terminated?

The Quadra 900/950 has two SCSI buses, Internal and External.

The Internal Bus is terminated on both ends (one termination on the logic board and the other at the other end of the internal SCSI cable). THIS MEANS THAT ANY INTERNAL DEVICE SHOULD NOT HAVE TERMINATION RESISTORS. THEREFORE, MAKE SURE THE TERMINATION RESISTORS HAVE BEEN REMOVED BEFORE INSTALLING A DEVICE INSIDE THE QUADRA 900/950!

Note: All prior Macintoshs required the internal hard disk drives to have termination resistors on them. Hence, most hard disk drives' vendors ship their internal disk drives with termination resistors installed. With the Quadra 900/950, the terminators need to be removed since the internal bus is already terminated at both ends.

External SCSI is terminated on the logic board. As external devices are added the last device should have an external terminator installed (Gray Terminator- Apple Part Number 658-8032).

Though the Quadra 900/950 has two independent SCSI buses, system software views the two as a single logical bus. Like with other Macs, the CPU ID is 7. This allows for a total of 7 SCSI devices (IDs 0-6) to be added internally and externally. Users must be careful not to use the same ID on more than one device (internal or external).

## VideoSync: Avoiding Flicker when Video Taping a Macintosh (3/95)

Revised: 3/28/95  
Security: Everyone

VideoSync: Avoiding Flicker when Video Taping a Macintosh (3/95)

Article Created: 22 December 1991  
Article Reviewed/Updated: 28 March 1995

TOPIC -----

This article describes VideoSync, a product which eliminates flicker when video taping the image on a Macintosh monitor.

DISCUSSION -----

VideoSync is a utility designed to allow the video recording of Macintosh monitor images with consumer or professional video camera equipment. VideoSync supports the Macintosh Display Card 4•8, 8•24, 8•24 GC, Apple High Resolution Video Card, and the Macintosh II Video Cards when connected to an AppleColor High Resolution RGB or monochrome monitor or Macintosh 12-inch RGB Display.

The utility is an extension to the Monitors control panel that adjusts the timing of the Apple display card so that the monitor image appears stable when viewed by an external NTSC camera. VideoSync does not create RS-170A timing for directly recording Macintosh screens to VCR. VideoSync can be licensed as a stand-alone utility for video integration applications, or serve as a platform on which to add other video timing alternatives.

The VideoSync utility is not compatible with Power Macintosh and Quadra AV computers. See the Tech Info Library article titled "VideoSync: Not Supported on Power Macintosh" for additional information on compatibility with the Power Macintosh and Quadra AV computers.

VideoSync is available through online services Apple publishes software updates on.

These articles can help you locate software updates mentioned here:

- Where To Find Apple Software Updates
- Lists online services for "free" Apple software updates

- Obtaining Apple Product Support in the USA

Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech. Info. Library

Article Change History:

28 Mar 1995 - Changed filming to video taping in title.

03 Mar 1995 - Added where to locate VideoSync.

## Macintosh 16-Inch Color Display: Features and Benefits

Revised: 1/28/92  
Security: Everyone

Macintosh 16-Inch Color Display: Features and Benefits

=====

Article Created: 13 January 1992  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

This article describes the features and benefits of the Macintosh 16-inch Color Display.

DISCUSSION -----

The Macintosh 16-inch Color Display works with modular Macintosh systems such as the Macintosh Quadra 700 and 900 personal computers. You can organize your work more effectively using the Macintosh 16-inch Color Display, because its 16-inch diagonal screen gives you 70 percent more work area than standard monitors. Not only can you see multiple windows of text and color graphics at the same time, you can also access disk volumes and the Trash while a full page-width document is open.

The Macintosh 16-inch Color Display uses a Sony Trinitron picture tube with a high-contrast screen. This combination ensures sharp focus, high brightness, and uniform image clarity across the entire screen. A tilt-and-swivel base adjusts easily to a comfortable viewing angle, and an anti-glare, anti-static screen reduces glare and eliminates dust build-up.

The display's brightness, contrast, and power controls are located on the front panel, and several built-in ports allow easy connection to Apple Desktop Bus devices (such as keyboard or mouse), microphone, and headphones.

### Display Quality

-----

- 16-inch screen, 832 horizontal by 624 vertical pixels (at 70 dots per inch) for 70% more work area than standard monitors

- Trinitron color picture tube for high brightness, sharp focus, and uniform color
- Complements high-performance systems such as the Macintosh Quadra 700 and Quadra 900

#### Ergonomic Features

- Tilt-and-swivel base for adjustment to comfortable viewing angle
- Anti-glare, anti-static screen
- 75 hertz refresh rate and degaussing capability eliminate flicker and distortion
- Meets Swedish MPR recommendations for low-frequency magnetic emissions

#### Ease of Use

- Plug-and-play simplicity with most modular Macintosh computers
- Easy access to brightness, contrast, and power controls
- Built-in ports for ADB devices (such as keyboard or mouse), microphone, headphones, or external speakers

#### Power Controls

Built-in ports for ADB devices (such as keyboard or mouse), microphone, headphones, or external speakers

#### System Requirements

- a modular Macintosh computer with on-board video support, such as a Macintosh Quadra personal computer, or
- any NuBus-capable modular Macintosh such as the Macintosh IIsi or IIci.

## Macintosh 16-Inch Color Display: Technical Specs. (Discontinued)

Revised: 6/20/94  
Security: Everyone

Macintosh 16-Inch Color Display: Technical Specs. (Discontinued)

=====

Article Created: 13 January 1992

TOPIC -----

This article provides the technical specifications for the Macintosh 16-inch Color Display.

DISCUSSION -----

### Picture Tube

-----

- 17-inch diagonal (16-inch viewable) Trinitron CRT
- .26-mm pitch aperture grill
- High-contrast glass with anti-glare, anti-static coating

### Resolution

-----

- 832 horizontal by 624 vertical pixels
- 70 dots per inch

### Active Display Area

-----

- Adjusted at the factory to produce an active video area described by an ideal rectangle of 11.8 x 8.86 inches (300 x 225 mm)

### Input Signals

-----

- Red, green, and blue video signals; separate sync, negative-going TTL

### Scan Rates

-----

- 50 kilohertz horizontal
- 75 hertz vertical

### Controls

-----

- Brightness
- Contrast
- Power on/off (automatic degauss at power up, manual degauss by turning power off, then on)

#### Size and Weight

- Height: 17.25 inches
- Width: 16 inches
- Depth: 17 inches
- Weight: 50 lb.

#### Operating Environment

- Temperature: 50 to 95 degrees F (10 to 40 degrees C)
- Humidity: 95% maximum, noncondensing

#### Input Electrical Requirements

- Voltage: 90 to 270 Vrms
- Frequency: 47 to 63 hertz
- Power: 130 watts maximum

#### System Requirements

- A modular Macintosh computer with on-board video support, such as a Macintosh Quadra personal computer, or any NuBus-capable modular Macintosh such as the Macintosh IIsi or IIci.

Macintosh: Troubleshooting System Bombs (1 of 3)

Article Created: 15 January 1992  
Article Last Reviewed: 22 July 1992  
Article Last Updated:

TOPIC -----

Most system bomb error messages are due to software problems. This article provides troubleshooting tips for four major types of software.

DISCUSSION -----

THE FOUR MAJOR TYPES OF SOFTWARE  
-----

System Software  
-----

System software includes all the files in the System Folder that make up the Operating System.

- The files named System and Finder are the main components of the operating system and are loaded into RAM when you turn on or reset the computer.
- INITs (Extensions) are startup programs and initialization resources stored in the System Folder (with System 7, they are inside the Extensions folder). They are memory resident files that are loaded into RAM when you turn on or reset the computer. Examples: QuickMail and Easy Access.
- cdevs are control panel devices. These files appear as scrollable icons in the Control Panel desk accessory window under System 6, or as separate, launchable programs in a Control Panels folder under System 7. They are loaded into RAM when you turn on or reset the computer. You may change options from within each Control Panel. Examples: Pyro, After Dark, Adobe Type Manager, and Sound Master.

- RDEVs are remote devices or Chooser files. These files appear in the Chooser under the Apple menu. Examples: ImageWriter, LaserWriter, DeskWriter, CD-ROM, and AppleShare. Under System 7, they belong in the Extensions folder.
- Preferences files keep default or current settings for programs. Examples: Word Settings, MsWorksPref, PM4 Defaults, and Excel Settings.
- Some files are combinations of the above. Examples: Pyro (INIT/CDEV) and StyleWriter (INIT/RDEV).

NOTE: To simplify the description of INITs, cdevs and RDEVs, this document will use the collective term INIT to describe any file that contains INIT code to be executed at startup time.

#### Application Programs

-----

Examples of application programs: Microsoft Word, Microsoft Excel, Microsoft Works, FileMaker Pro, MacPaint, MacWrite, and Aldus PageMaker.

#### Program Files

-----

Program files are the files that contain data or instructions a program may need during its use. Examples: printer definition files, import/export filter files, and data files.

#### Data Files

-----

Your files are the documents created when you choose "Save" in a program. Examples: word processing, spreadsheet, communication, database, drawing, and page layout files you created.

#### TROUBLESHOOTING SYSTEM BOMBS

-----

Here are some troubleshooting tips for the various types of software.

#### System File & System Folder Procedures

-----

- Put a Disk Tools or System Startup diskette in the floppy drive and turn on your computer. This prevents the INITs in the System Folder from running, and eliminates them as a possible cause of the problem. This is a quick way to determine if a major problem which occurs near startup time is related to your System Folder. If the problem is resolved, then continue on with the next step. If the computer still bombs right away and you know your System Disk is good, then you may have a hardware problem.

- Move all INITs and non-Apple files\* (Preferences files, screen fonts, and so on) to a separate folder outside the System Folder and restart. If you're no longer getting system bombs, replace the INITs one at a time, and restart your computer following each replacement until you get the error again. The last one put in is likely the cause of the crashes. It may be corrupted or incompatible with the System or other INITs and/or programs. If you still get a system bomb after removing all INITs and non-Apple files from the System Folder, try the next step.

\* Non-Apple files are any files that AREN'T found on the original Apple Macintosh System Disks that come with your computer.

- Start up from your Disk Tools or System Startup disk. Open the System Folder and drag your current System and Finder files to the trash. (For System 6, consult your user's manual on the use of the Font/DA Mover program to copy your fonts and desk accessories out of the System file first.) Reinstall a new copy of the system using the Installer on your System Tools or Install 1 disk. If this doesn't work, try the next step.
- The Preference files may be corrupted. You can drag some to the trash and the programs will recreate the files the next time you run those programs (settings saved in these files will be lost). You will have to copy some Preference files using the program installation procedure. Consult your program manual or call the manufacturer of the program to find out what is necessary. If the system doesn't work once the new Preference files have been created, try the next step.
- Start up from your Disk Tools or System Startup disk. Drag the entire System Folder to the trash (be sure you have all INITs, preference files, fonts, desk accessories, and any other non-Apple files on floppy disks or in another folder on the hard drive before this procedure. For System 6, consult the manual on the use of the Font/DA Mover program to copy your fonts and desk accessories out of the System file.) Restart from the installation disk (Install 1 under System 7) and run the Installer to place a new copy of the System Folder on your drive. Check the system before re-installing your INITs, preference files, fonts, desk accessories and any other non-Apple files. If it works, re-install them one at a time until the System Folder is back to its original state. If this does not work, continue.

#### Programs, Program Files, Data Files

-----  
Programs or files may be the cause of problems. Here are some suggestions.

- You may (if possible) run the program from a floppy disk instead of the hard drive to determine if it is the cause of the problem. This is likely if you get the bomb in one program and no others. If this is not possible then try dragging the program's folder to the trash (saving any files you may have created first). Also throw away any preference files or folders associated with the program in the System Folder. Re-install the program from the original diskettes. If this

does not work, try the next step.

- A file that you have created may cause a bomb each time it is loaded or while you are using or editing it. Sometimes you can make a new file and copy the contents of the old file to it to solve the problem. In most cases you will need to restore the file from your backup if you have one or re-create the file if you don't.

## Macintosh: Troubleshooting System Bombs (2 of 3)

Revised: 7/23/92  
Security: Everyone

Macintosh: Troubleshooting System Bombs (2 of 3)

=====

Article Created: 15 January 1992  
Article Last Reviewed: 22 July 1992  
Article Last Updated:

TOPIC -----

This article lists some of the common causes of system bombs.

DISCUSSION -----

### Incompatible Software

-----

Many pieces of software (System, INITs, Applications) are loaded into memory and run at the same time. System bombs occur if the versions of the software aren't compatible. You may call the application's manufacturer to find out if the software is compatible with your system and the other software you are running. You can find versions of programs, INITs, and the System file by selecting the file's icon at the Finder and choosing Get Info from the File menu.

### Corrupt Software

-----

Sometimes a piece of software may become corrupted. Events that can corrupt files include:

- Not choosing Shut Down before turning off your Macintosh.
- SCSI data line problems can corrupt software or even the format of your hard disk.

### Viruses

-----

A virus is seldom destructive, but can do any of the following:

- Display messages.
- Corrupt software.

- Change software or hardware settings.
- Cause system bombs.

The Tech Info Library contains several articles about viruses and their symptoms.

#### Hardware Problems

-----  
In a few cases, certain hardware problems may cause system bombs. Using peripherals or expansion cards that aren't fully compatible with the computer can cause bombs. Bad or insufficient memory may also cause bombs.

## Macintosh: Troubleshooting System Bombs (3 of 3)

Revised: 2/4/92  
Security: Everyone

Macintosh: Troubleshooting System Bombs (3 of 3)

Article Created: 15 January 1992  
Article Last Reviewed: 22 July 1992  
Article Last Updated:

TOPIC -----

Here are some troubleshooting tips regarding the major causes of system bombs.

DISCUSSION -----

### Incompatibility in Software

Verify that your application is the most current version available and fully compatible with your Macintosh model. Check with the software manufacturers for information on the latest revisions, what version of the system should be used with what version of the application, and incompatibilities.

All INITs, programs, and System files must be compatible with each other. You need to know the EXACT version of applications and INITs. For example, Microsoft uses version numbers in the following sequences: 2.0; 2.00a; 2.00b; 2.00c; 2.00d. These represent Microsoft Works versions. Microsoft Works 2.00a is a problem in the System 6.0.7 environment. Microsoft Works 2.00b is compatible with System 6.0.7. It isn't enough to state that Microsoft Works 2.0 is a problem. The version numbers need to be EXACT.

### Corrupt Files

Any type of software may become corrupted. It can be very difficult to find out which piece of software may be causing your problem. Following the steps outlined in the "Troubleshooting System Bombs" section may be the only way to discover the corrupted software.

### Viruses

-----

The best way to combat viruses is with one of the many virus detection and correction programs available today. Viruses haven't caused problems on computers with the latest copy of a virus protection program installed. You'll need to start your computer from a floppy disk containing a virus detection program to fully check and "vaccinate" your hard disk. The System file and other software may not be diagnosed or fixed if they are running when the hard drive is checked. Once the hard drive has been checked and cleared of any offending viruses, an INIT file that scans each floppy disk as it is inserted will keep your system virus free. See the discussion of "Co-processor not installed!" errors for some information on the WDEF virus.

#### Hardware

-----

If hardware is the problem, you should take your system to an authorized Apple dealer for a thorough diagnostic check. If problems continue after you've explored all software situations, look at hardware -- particularly memory or memory management.

It could be RAM or the logic board. RAM problems can show up after warm-up. For example, a marginal SIMM's speed may be fine when cool but slow down after warming up. All SIMMs do this to a certain extent, but you may have a SIMM that crosses the Macintosh computer's tolerance threshold when warm. The only fix for this is to replace the offending SIMM or SIMMs. A similar problem could be happening within the memory manager's circuitry on the logic board; the only possible fix is a complete logic board replacement.

You may also have a SCSI problem, particularly if you have external SCSI devices attached. This problem occurs most often when you have external SCSI devices attached, but not turned on. You must turn on all SCSI devices before starting the Macintosh, and you must leave them on until you turn the Macintosh off. If you don't take these precautions, you can introduce garbage onto the SCSI data line.

Improper termination of the SCSI chain also causes this problem. If your SCSI chain is the source of your problem, be aware that the garbage on the SCSI chain may have corrupted the hard drive's format. You'll need to reformat your hard drive with either all the external SCSI devices removed or all of them turned on.

## QuickTime: Description

Revised: 1/22/92  
Security: Everyone

QuickTime: Description

=====

Article Created: 9 December 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

QuickTime is a new system software architecture for the integration of dynamic media for Macintosh computers. QuickTime allows developers to integrate dynamic media -- such as sound, video, and animation -- in a consistent, seamless fashion across all applications. This article describes the software architecture in more detail.

DISCUSSION -----

QuickTime offers a standard platform for all Macintosh development, enabling developers to extend the capabilities of current applications as well as create entirely new categories of applications. These new categories include videoconferencing, store-and-forward video mail, low-cost video editing, and dynamic CD-ROM magazines.

The QuickTime architecture consists of four major components:

- System software
- File formats
- Apple Compressors
- Human Interface Standards

These components form a software architecture that is extensible, open, and offers cross-platform standards for dynamic data exchange.

System Software

-----

QuickTime is the first software extension to System 7. To install it, drag the QuickTime extension into the System Folder. QuickTime enables developers to incorporate dynamic data in a consistent and seamless fashion

across applications. The system software component of QuickTime incorporates three new pieces:

- Movie Toolbox  
Apple uses the term "movie" to denote dynamic data such as sound, video, and animation. The Movie Toolbox is a set of system software services that make it easy for developers to incorporate support for movies in their applications.
- Image Compression Manager  
The Image Compression Manager (ICM) shields applications from the intricacies of individual compression and decompression schemes. The ICM allows software and hardware developers to take advantage of numerous compression schemes -- such as DVI, Group 3 fax and MPEG -- in their applications, without having to make modifications.
- Component Manager  
The Component Manager allows external system resources -- for example, digitizer cards, VCRs, and system software extensions -- to register their capabilities with the Macintosh system software so any application can access these capabilities. In the past, application developers who wanted to take advantage of features from a hardware product, such as a digitizer card, would have to write custom software for that card and update their software each time the hardware was updated. With QuickTime, the hardware is transparent to the software application, and developers can concentrate on the capabilities they would like to offer.

## File Formats

-----

File formats are standard descriptions for a piece of data such as text and graphics. These standard descriptions are supported by most applications, thus allowing users to "cut and paste" or "Publish and Subscribe" data between applications and documents.

- Movie  
With QuickTime, Apple is introducing a new file format, known as "Movie." Movie refers to all dynamic data, such as a presentation slide show or a dynamic graph of lab data. The Movie file format is a container for this time-based data. Apple is publishing the full specifications for the Movie file format, thus providing developers of cross-platform applications with a standard way of exchanging dynamic data from one computing environment to the next.
- PICT Extensions  
In addition to introducing the Movie file format, Apple is also extending the PICT file format. With QuickTime, the PICT file format will now support image compression, enabling users to open any compressed still image from within any existing application. The PICT file format will also offer preview support, allowing applications to save a small "thumbnail" of a picture along with the image itself. These thumbnails will allow users to quickly browse through still image libraries in the same way they currently browse through files in a folder.

## Apple Compressors

-----

The first release of QuickTime provides a basic set of software compression/decompression schemes that meet a range of compression needs for still images, animations, and video.

### - Photo Compressor

Apple is the first personal computer company to implement the Joint Photographic Experts Group (JPEG) compression scheme as a standard part of system software. JPEG is a high-quality still image compression scheme that offers compression ratios ranging from 10:1 to 25:1 with no visible picture degradation.

### - Animation Compressor

The Animation Compressor is based on run-length encoding principles to compress computer-generated sequences from 1 to 32 bits in depth. This compression scheme displays animations -- such as a presentation slide show or a dynamic bar chart -- at acceptable speeds on all Macintosh computers. In addition, the Animation Compressor allows complex animations -- such as 32-bit scientific visualization data -- to be previewed on any Macintosh, thus saving users the time and expense of having to lay the animation to videotape one frame at a time.

### - Video Compressor

Apple developed the Video Compressor to allow digitized video sequences to play back from a hard disk or CD-ROM in real-time with no additional hardware on any Macintosh with a 68020 or higher Motorola processor.

The Video Compressor offers compression ratios ranging from 5:1 to 25:1. The video playback size is typically less than 1/4 of the computer screen size.

## Human Interface Standards

-----

Apple is also providing human interface guidelines for dynamic media. These guidelines will ensure ease-of-use and consistency across applications when dealing with dynamic media.

### - Standard Movie Controller

Apple designed a standard movie controller as part of QuickTime, providing users with a consistent way to control movies. The movie controller will allow users to:

- Turn sound on and off
- Play or stop a movie
- Interactively move to different segments in the movie
- Step-forward and step-reverse through the movie (provides an indication of where the user is in the movie at all times)

### - Standard File Dialog Box

Apple has extended the standard file dialog box to offer developers a preview option. Application developers can now incorporate a dialog box

## ..TIL09411-QuickTime-Description.pdf

that includes a preview window for still images and movies into their products.

## Radius Multimedia Products: Support for Apple QuickTime

Revised: 2/28/92  
Security: Everyone

Radius Multimedia Products: Support for Apple QuickTime

=====

Article Created: 10 December 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Radius, Inc. is upgrading RadiusTV and ImpressIt to take advantage of the new features in QuickTime. QuickTime provides a standard architecture and interface for multimedia hardware and software applications on the Macintosh. QuickTime compatibility allows integration of Radius multimedia products with QuickTime-compatible hardware and software products from other vendors, increasing the range of multimedia options available.

DISCUSSION -----

Radius has rewritten the software for RadiusTV and ImpressIt to take advantage of QuickTime features, including:

- A time-management control system for synchronizing data
- Interface guidelines for hardware products
- Drivers for multimedia peripherals such as CD-ROM drives
- Built-in video editing

By supporting QuickTime, RadiusTV will be compatible with all other QuickTime compatible multimedia software applications. Previously, software applications required a special driver for compatibility with RadiusTV. Now, an application software developer can write a single QuickTime-compatible driver for a program to obtain compatibility with all QuickTime compatible multimedia hardware products like RadiusTV.

ImpressIt, Radius' still-image compression software, has been designed to integrate seamlessly with QuickTime. Users may elect to have ImpressIt automatically compress images when saved to a hard disk, rendering the entire compression process transparent.

## RadiusTV

-----

RadiusTV is a multimedia hardware and software platform that blends an array of audio and visual sources on the computer. RadiusTV features a video processing engine and an external audio-video input processor and television tuner -- to bring television functionality into the Macintosh environment.

RadiusTV is capable of displaying and digitizing live 16-bit video images in real-time (30 frames/sec) in a resizable window of up to 640 x 480 pixels. RadiusTV also digitizes sound in real time and provides access to information included in the television signal's vertical retrace interval (such as closed captions and calibration settings), making complete Macintosh control and processing possible. RadiusTV also includes Theatrics, a software package that allows image processing on captured images.

## ImpressIt

-----

ImpressIt is a Macintosh software compression product for color and grayscale still images. The fastest software solution available today, ImpressIt can compress images by up to 100 times. ImpressIt is based on the JPEG (Joint Photographic Experts Group) standard. A 24-bit 750K color image can be compressed to 25K in under 3 seconds when run on a Macintosh IIIfx.

## QuickTime: Description of Its Components

Revised: 1/22/92  
Security: Everyone

QuickTime: Description of Its Components

=====

Article Created: 13 December 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

This article describes QuickTime's three major components:

- the Movie Toolbox
- the Component Manager (and its components)
- the Image Compression Manager

The article concludes with a description of graceful degradation as it applies to QuickTime.

DISCUSSION -----

The Movie Toolbox

-----

The Movie Toolbox includes the routines you need to play, edit, create, and otherwise manipulate time-based data in QuickTime files. If a file contains compressed image data, the Movie Toolbox automatically interacts with the Image Compression Manager to decompress the movie in the optimum way in real time. The Movie Toolbox includes routines with names such as CreateMovieFile, CutMovieSelection, IsMovieDone, and AddUserData.

The Component Manager

-----

The Component Manager manages multiple components -- software packages that are somewhat like device drivers. Like drivers, components can be the software interface to external hardware. Unlike drivers, however, components (for example, a software-only image compressor) can do work by themselves. Components are also different from drivers in that components provide a high-level, device-independent way to get the job done. (In contrast, to use a driver you have to know its exact name and characteristics.)

At startup, the Component Manager searches for all files of type 'thng' and registers them. Once they are registered, your program can ask the Component Manager which components are available and can then use whichever one you choose.

The most specific way the Component Manager can search for a component is by type (a four-character ID that characterizes a component as being able to respond to a specific set of calls). For example, 'imdc' components provide a standard set of image-decompression services. Note, however, that the 'imdc' component can be either a software-only decompression routine or the interface to a hardware-decompression NuBus card. A program using QuickTime can call FindNextComponent repeatedly to find out what kinds of decompression are available and can then decide whether to go with the fastest decompression available or perhaps a slower one that gives a better image.

The Component Manager also allows a component to describe itself in greater detail. The component's description (and a program's query) can also include a four-character subtype, a four-character manufacturer ID, and a 32-bit field of flags selected by a 32-bit mask field. By using full component descriptions and the Component Manager, your program can find the best component for the job without opening it or knowing its exact characteristics. If the component allows multiple simultaneous access, the Component Manager will allow multiple callers to use multiple instances of the component at the same time.

QuickTime 1.0 will include six component types:

- image compression ('imco')
- image decompression ('imdc')
- standard movie player ('play')
- component ('thng')
- video digitizer ('vdig')
- clock ('clock')

#### The Image Compression Manager

-----  
This set of routines is your program's gateway to image-compression/decompression services. The Image Compression Manager does so many things that it is almost impossible to list them all. The paragraphs that follow describe the most important ones.

- The Image Compression Manager provides a standard high-level interface for the compression and decompression of images. These services are implemented as QuickTime components, so the Image Compression Manager uses the Component Manager to get its work done. These two managers work together to give your program easy, device-independent access to the best compression and decompression services available on the Macintosh running your program.
- The Image Compression Manager ensures that your efforts today will automatically work with new compression/decompression solutions in the future. The Component Manager can hide whether a component is software

or hardware. This means that your QuickTime-aware program coded today can automatically take advantage of future compression/decompression solutions without changes in its code.

- The Image Compression Manager enhances the PICT definition in a way that benefits existing and new applications. As mentioned at the beginning of this article, when QuickTime is present, any program -- QuickTime-aware or not -- can read PICTs that contain QuickTime-compressed pixmaps. (Apple engineers have extended the PICT definition by defining a new opcode value for compressed pixmaps. If a Macintosh is not running QuickTime, it simply skips the compressed image data.) Use this new capability to add more color and gray-scale pictures to your programs.
- When an application wants something done that the available compressor and decompressor components can't do, the Image Compression Manager helps the work get done. Sometimes none of the components can act on a request, because the image is at the wrong bit depth, is of the wrong type (indexed versus direct color), is too big to be done in one piece, or is being displayed across two different monitors. In such cases, the Image Compression Manager automatically steps in to convert the image to the proper type, hand it to the appropriate component, and then convert (if necessary) and return the result.

#### Compressor and Decompressor Components

-----

QuickTime 1.0 will ship with compressor and decompressor components for three data types: still-image, video, and animation.

Use these components for still and moving pixmap images only; they aren't meant to be used on audio, text, or any other data type. Some compressors can be either "lossless" (the decompressed data is identical to the original) or "lossy" (the decompressed version has lost some of the original information). Many lossy compressed images can be much smaller than a lossless version could ever be and still decompress to an image that shows little or no difference from the original. (This is especially true for video and animation movies, where each image is seen for only a fraction of a second.)

Apple will supply three compressors (and their accompanying decompressors) with QuickTime 1.0: the Photo, Animation, and Video Compressors. Because these compressors are a part of QuickTime, they are a part of Macintosh system software, and this means they are available to any color-capable Macintosh.

Although these software-only compressors are very useful just as they are, they don't constitute Apple's full video-compression/decompression architecture.

#### QuickTime 1.0 Compressors

-----

The following paragraphs describe each of the compressors that come with QuickTime 1.0. Please keep in mind that the "average" compression ratios

quoted below vary widely with the content of the image and the nature (lossy or lossless) of the compression.

## - Photo Compressor

The Photo Compressor is a software implementation of the baseline JPEG (Joint Photographic Experts Group) still-image standard. It will work with images (as many as 24 bits of color per pixel) and can, depending on the image content, achieve 5:1 to 10:1 compression ratios with little or no visible change to the decompressed image. (Higher compression ratios are also possible, often with very good results.)

## - Animation Compressor

The Animation Compressor is best at compressing and decompressing computer-generated animations—graphics sequences in which much of the image is "pure" and doesn't change between successive frames. (Animation is usually created by programs such as Electronic Arts' Studio/1, MacroMind's Director, and Paracomp's FilmMaker). The Animation Compressor has the very important quality of being able to decompress and play a movie (along with its synchronized sound) in real time from hard disk or CD-ROM.

Apple's Animation Compressor is based on run-length encoding (RLE) compression, which is very effective on images that contain "runs" of identical pixels. The "noise" of a digitized video image (where pixels change value slightly from frame to frame) usually defeats the advantages of RLE compression.

The Animation Compressor can work in either a lossless or a lossy mode. In addition, it can store movie frames by their differences -- that is, store only those pixels that have changed between successive frames. This method, called frame differencing or temporal compression, can achieve very high levels of compression. Compression ratios are often in the range 10:1 to 50:1.

## - Video Compressor

The Video Compressor works well on digitized video or scanned imagery. Like the Animation Compressor, it can decompress and play a movie and its sound in real time. (Without the ability to play movies directly from a disk, QuickTime would be able to show only very short movies that could be stored in and played from memory.) This compressor can also use frame differencing; when it does, it can produce compression ratios in the range 5:1 to 25:1.

For still-image compression and decompression, trade-offs occur among five factors: compression time, decompression time, image quality, processing power of the computer used, and compression ratio. Along with the above trade-offs, movie compression and decompression add two more: the frame rate (the number of frames displayed per second) and the presence or absence of audio. Although video quality can vary with circumstances, the quality of the audio itself is usually assured: QuickTime gives audio higher priority than video.

Graceful Degradation

-----

One very important property of QuickTime is its "graceful degradation." That is, when given a larger task than it can handle, QuickTime approximates or drops less important attributes and retains the most important ones for as long as it can. For example, if QuickTime can't do 32-bit colors, it uses the 8-bit colors it has and approximates more colors by dithering. Or, if QuickTime can't show a movie at its internal frame rate, it drops frames to keep up but always keeps the audio running smoothly.

## QuickTime: How Movies Work

Revised: 1/22/92  
Security: Everyone

QuickTime: How Movies Work

=====  
Article Created: 13 December 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

The most important thing about QuickTime is that it allows users to create, play, and edit sets of time-based data. If you want to capture new video footage, you will need extra equipment -- a digitizer card, video camera or controllable VCR, and associated components. But you will be able to play and edit movies and other time-based data without extra hardware.

This article describes the movie feature of QuickTime, and provides some human-interface suggestions.

DISCUSSION -----

Movies, Tracks, and Media  
-----

A movie file contains a resource of type 'moov' (pronounce it "moo-vee"), which describes the movie in terms of its tracks, its media, and its references to the raw data the movie is to play.

Assume the movie contains all the knowledge needed to run the movie (the tracks and the media), but not the actual contents of the movie (the data). The data can easily run into multiple megabytes, whereas the movie itself is short enough to fit on the 2 Clipboard. By factoring out the large amount of data needed to play a movie, Apple engineers have made the movie file small enough to be moved, edited, cut, copied, or pasted easily.

You can think of a QuickTime movie as a container for tracks. The movie starts at time 0 and plays until it is finished. Depending on how they are defined, one or more tracks (each containing one kind of data: video, animation, or sound, for example) are active and playing at any instant.

To keep the concept of a QuickTime media general enough to be useful with vastly different data types, a media contains not the data but a one-to-one, linear mapping between itself and the data. (Yes, we do call it "a media," largely because QuickTime documentation, routine names, and variables exclusively use the word media instead of medium.) The data, for now, is always in a file somewhere on the network. Someday the data may be outside the Macintosh and its network -- for example, on a videotape in a VCR the Macintosh controls.

Each track has exactly one media associated with it, and vice versa. The track, through the media and code called the media handler, points to whatever data should be playing at any given time. This means that a track can omit part of the media, play segments out of sequence, play the same segment multiple times, or even play sequences that overlap within the media. This means that a movie-editing program can rearrange or delete movie footage simply by adding or changing a handful of pointers within a track. (If such a program had to cut and paste the actual footage, the program would be prohibitively slow and the delay would be proportional to the amount of footage moved.)

Movies, tracks, and media all have time scales; and they can all be the same, or they can be different. If the time scale of a track is 10, then ten such units make one second of playing time, and the track can start at any 1/10-second interval. Fortunately, QuickTime takes care of synchronizing all these time scales with the others.

#### Human Interface Suggestions

-----  
For QuickTime to be successful, movies must have certain basic behavior that users can learn (or, better, already know) and then forget. A program should be able to select a movie, cut or copy it to the Clipboard, and paste it from the Clipboard into a document.

A program should also implement an easy, common-sense way of playing and stopping movies and controlling the sound output (a sound-mute control is mandatory, but a volume control is even better). Apple created a new Macintosh human-interface element, the standard movie controller.

The standard movie controller can give basic movie control to users in the same way every other QuickTime program will. With a few Movie Toolbox routines, the standard movie controller gives users basic control of the movie's playback.

Here are some enhancements to movie behavior to implement:

- A poster is a single image that best represents the movie. It might be used when the movie is visible in its document but isn't playing or when the document containing the movie is printed. The poster can come from one of the movie's video tracks (that is, the frame at time  $t$  from track  $x$ ), or it can be an arbitrary image in its own track. (Apple recommends that you store a poster as a PICT with an uncompressed pixmap so that the user can see it in the Preview dialog box even if the proper

decompressor isn't present.)

- A preview is a short subsequence of the movie that also represents the movie in an appropriate context; it might play, for example, when a user is previewing a long movie file.
- Another useful option for movies is that of alternate tracks. With them, you can specify alternative representations of the same data, with the understanding that only one is active at a time. A simple example is an instructional movie that has vocal instructions in Spanish, English, and French, only one of which the user chooses when playing the movie. Another example is a movie that contains two alternative video tracks, one (of lower quality) meant to be played by a software-only decompressor and the other (of higher quality) requiring hardware decompression. The program playing the movie could then automatically show the movie at the best quality level available to the program and its hardware.

QuickTime: Image Compression Details

=====

Article Created: 16 December 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Apple supports all compression schemes through QuickTime's Component Manager and Image Compression Manager services.

Here is a brief overview of compression characteristics and the initial Apple-supplied compressors.

DISCUSSION -----

Characteristics

-----

There are four main characteristics of image compression algorithms:

- Compression ratio
- Image quality
- Compression/ decompression speed
- Spatial/temporal compression

Compression Ratio

-----

The compression ratio is equal to the size of the original image divided by the size of the compressed image. This ratio gives an indication of how much compression is achieved for a particular image. Most algorithms have a typical range of compression ratios that they can achieve over a variety of images. Because of this, it is usually more useful to look at an average compression ratio for a particular method.

The compression ratio typically affects the picture quality. Generally, the higher the compression ratio, the poorer the quality of the resulting image. The tradeoff between compression ratio and picture quality is an

important one to consider when compressing images.

Furthermore, some compression schemes produce compression ratios that are highly dependent on the image content. For example, a highly detailed image of a crowd at a football game may produce a very small compression ratio, whereas an image of a pure blue sky may produce a very high compression ratio.

#### Image Quality

-----

Compression schemes can be lossy or lossless. Lossless schemes preserve the original data. Lossy schemes don't preserve all the original data; you can't recover lost picture information after compression. Lossy schemes attempt to remove picture information the viewer won't notice. As more and more picture information is removed, the picture quality decreases.

#### Compression/Decompression Speed

-----

Compression and decompression time is defined as the amount of time required to encode and decode a picture, respectively.

Compression/decompression speed depends on:

- The complexity of the compression algorithm
- The efficiency of the implementation of the algorithm
- The speed of the processor hardware

Generally, the faster that both operations can be performed, the better. Fast compression time speeds up the material creation. Fast decompression time speeds up display and user interaction with images.

#### Spatial and Temporal Compression

-----

Spatial compression removes information from within a single still image. Temporal compression removes information between frames.

#### Apple-Supplied Compressors

-----

Apple supplies a basic set of three image compression algorithms for the first release of QuickTime:

- The Photo Compressor
- The Animation Compressor
- The Video Compressor

It's important to note that these compressors represent only a portion of Apple's overall compression strategy, which includes both hardware and software-based schemes. Software-based video compression provides users with a starting point that meets the minimum requirements of many applications while allowing room for additional schemes.

The following paragraphs discuss each of these compressors in greater detail.

## Photo Compressor

-----

The Photo Compressor implements the Joint Photographic Experts Group (JPEG) algorithm for image compression. JPEG is an international standard for compressing still images. The technique is based on the use of the Discrete Cosine Transform (DCT). The version of JPEG supplied with QuickTime complies with the ISO baseline standard.

The general character of DCT-based compression schemes is that they perform best on images that vary smoothly, or that don't have a large percentage of their areas devoted to edges or other sharp detail. Most natural images fall into this category. For such 24 bits per pixel images, the Photo Compressor will produce a reconstructed image which is visually indistinguishable from the original at a compression ratio of 10:1. In practice, you will find that compression ratios are highly dependent on image content, but generally range from 5:1 to 100:1, with excellent picture quality resulting from compression ratios between 10:1 and 20:1. Compression time is equal (or very nearly equal) to decompression time.

On a Macintosh IICx, it takes approximately 10 seconds to decompress images at 640 x 480 pixel resolution. The compression speed scales with CPU performance, so on a Macintosh IIfx, the same operation would require approximately 4 seconds. Photo quality is generally very good to exceptional and is often sufficient for use in demanding desktop publishing applications. Very high resolution images obtained through the use of 24-bit color scanners would best be compressed using the Photo Compressor.

## Animation Compressor

-----

Apple developed the Animation Compressor algorithm, based on run-length encoding techniques. This algorithm is best suited to animation and computer generated content. In addition, the Animation Compressor can compress sequences of screen-recorded images, such as those created by Farallon's ScreenRecorder product.

Like any QuickTime compressor, the Animation Compressor can compress input video images from all bit depths (1, 2, 4, 8, 16 and 24-bit color depths), and can decompress to all bit depths.

The Animation Compressor compression method can be considered an extension of the PICT image format to the temporal domain. A PICT image is stored in run-length encoded format and is lossless. Animation Compressor is also stored in run-length encoded format. However, Animation Compressor can work a lossy or lossless mode, and can support both spatial and temporal compression. Both modes maintain picture content precisely, storing an animation as a series of run-length encoded images. The lossy mode loses some quality, storing the difference between certain frames rather than the frames themselves, but is fast enough for real-time playback.

The Animation Compressor can play back images at up to 30 frames per second at full-screen resolutions, but its performance and achieved compression ratios are highly dependent on the type of images in a scene.

## Video Compressor

-----  
Apple developed the Video Compressor image compression to permit fast decompression while maintaining good picture quality. This rapid decompression also displays 24-bit still images very quickly.

The Video Compressor should generally be used for digitized video content rather than for synthetically generated images. This compressor supports both spatial and temporal compression. If you use only spatial compression, then you will obtain compression ratios from 5:1 to 8:1 with reasonably good quality. If you use both spatial and temporal compression, the compression ratio range extends from between 5:1 to 25:1.

On a Macintosh IICx, it takes half a second to decompress an image at full-screen resolution, and about three seconds to compress the same image. The compression speed scales with CPU performance, so on a Macintosh IIfx compressing a full-screen image requires one second, and decompress time is 1/5 second.

## Apple Token Ring 4/16 NB Card: Compared to TokenTalk Card

Revised: 2/4/92  
Security: Everyone

Apple Token Ring 4/16 NB Card: Compared to TokenTalk Card

=====

Article Created: 13 November 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

- 1) What are the differences between the Token Ring card and the earlier TokenTalk card?
- 2) Is an upgrade available?
- 3) Why did Apple change the name from TokenTalk Card to Token Ring Card?
- 4) What kind of speed increases can I expect at 16Mbps?

DISCUSSION -----

- 1) There are three main differences between Apple's previous Token Ring card and this one:
  - Transmission speed  
The old card supported only 4 Mbps transmission, and the new card supports both 4 and 16 Mbps.
  - On-board memory capacity  
The old card came with 512K RAM on the card, but there was no expansion capability. The new card comes with 512K standard, expandable to 1 or 2.5MB.
  - Token Ring technology  
The old card used the Texas Instruments TMS380 Token Ring chip set. The new card uses the industry-standard IBM Token-Ring chip set.

- 2) There's no upgrade program at this time.

- 3) Both of the cards are based on IEEE 802.5 standards for Token Ring, and will therefore work in all standard Token Ring environments. You can use multiple protocol stacks with the cards, including SNA and AppleTalk. In fact, because both cards are based on the Macintosh Coprocessor Platform architecture, you can run multiple network protocols simultaneously. Still, some customers found the name TokenTalk confusing, thinking that the card only supported AppleTalk protocols. We have changed the name to reflect the broad range of applications possible with the card, and to complement its standards-based design.
- 4) That depends on your network configuration. We find that in low-traffic situations, the increase in throughput is not astronomical. Generally, this is because the bottleneck is not how much information can be transferred over the wire, but how much can be processed in and out of the Macintosh. As the total amount of traffic on the ring increases, the capacity of the network becomes more important and 16Mbps token ring begins to perform better than 4Mbps Token Ring.

Operation at 16 Mbps also provides a feature called "Early Token Release," whereby more than one frame may exist on the ring at once. This provides an additional improvement in throughput, especially on large rings carrying a significant number of small frames.

## Apple Token Ring 4/16 NB Card: Hardware Q & A

Revised: 2/4/92  
Security: Everyone

Apple Token Ring 4/16 NB Card: Hardware Q & A

=====

Article Created: 13 November 1991  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

- 1) How do I set the transmission speed on the card?
- 2) Why would I want more memory on the card?
- 3) Can I buy my own memory chips and install them myself?
- 4) Why would I care about IBM technology?
- 5) Does the card require special cabling?

DISCUSSION -----

- 1) The speed setting is software selectable. In fact, the card ships with a Token Ring Control Panel Device (CDEV) that allows you to set the speed setting, the locally-administered address, and timer settings for Response, Acknowledge, and Inactivity. All of these settings can be password protected so users can't change them inadvertently. The settings are saved in a .PREFS file.
- 2) You might need more memory depending on what applications you want to run on the card.

With the standard configuration of 512K, you can run either TokenTalk 2.4 (for connection to AppleTalk services such as AppleShare file servers or LaserWriter printers) or the SNA•ps 1.1 gateway. In this configuration, SNA•ps can support 8 or fewer 3270 sessions or 4-6 APPC sessions, depending on SNA frame size.

With 1MB of memory on the card, you can support both TokenTalk 2.4 and

SNA•ps 1.1. The number of SNA•ps sessions you can support will vary depending on several factors, including the frame size you are using and the number of 3270 vs APPC sessions. As a rule of thumb, 32 3270 sessions or 16 APPC sessions with TokenTalk 2.4 should fit with 1MB of RAM.

With 2.5MB of memory on the card, you will be able to support TokenTalk 2.4 and SNA•ps 1.1 with up to 64 sessions.

- 3) Yes. The memory is socketed, and specifications for the memory chips are included in the manual.
- 4) Because the card is built with IBM technology, it's 100% compatible with IBM Token Ring cards. You can mix and match Macintosh and PS/2 computers on a Token Ring without worrying about compatibility. In addition, Token Ring products from other vendors are generally tested for compatibility with IBM Token Ring cards, so the same level of interoperability is afforded Apple's card.
- 5) No. The card has a standard DB-9 connector for attaching to IBM Type 1 cabling. In addition, media filters are available from third parties so that the card can be used to connect to IBM Type 3 (unshielded twisted pair) cabling. Because the ring interface is made by IBM, the card will operate within the same cabling guidelines as IBM's own products.

Apple Token Ring 4/16 NB Card: Software Q & A

=====

Article Created: 13 November 1991

Article Change History

06/28/93 - REVISED  
• To include MacTCP Token Ring Extension.

TOPIC -----

- 1) Can I use AppleTalk Remote Access with Token Ring now?
- 2) Does the card still ship with SMB File Transfer software?
- 3) The new card uses the IBM Token Ring chip set, whereas the TokenTalk NB Card used the Texas Instruments TMS380. Does that mean that I can't run the same software on both cards?
- 4) What version of SNA•ps runs on the card?
- 5) Do I need to keep the installer for both the old and the new card?  
Or will the new TokenTalk installer install a driver for the older card too?
- 6) Can I run MacTCP over Token Ring now?

DISCUSSION -----

- 1) Yes. The TokenTalk installer that ships with the Token Ring 4/16 NB Card will include AppleTalk version 57, which is required for AppleTalk Remote Access.
- 2) No. The SMB software that Apple was shipping prior to June 1991 was incompatible with the latest version of IBM's LAN Server and with System 7.0. Additionally, the Apple/IBM Enterprise Networking Initiative specifies the availability of native AppleTalk AFP support on IBM LAN

server products in the future.

- 3) No. Although the two cards use different hardware, the interface to the LLC task on the cards is the same, so software can be written to run on both cards. For example, you can run the same version of Apple's TokenTalk software, which provides Token-Ring users with access to AppleTalk services, on both the TokenTalk NB Card and the Token Ring 4/16 NB Card. The common TokenTalk software version is 2.4.
- 4) SNA•ps 1.0 doesn't work on the Token Ring NB Card. You need SNA•ps v1.1. If you are using both TokenTalk 2.4 and SNA•ps v 1.1, you will need at least 1MB of memory on the card. You should order the Apple Macintosh Coprocessor Platform Memory expansion kit (P/N M0145LL/A), or compatible third-party memory, if you are running SNA•ps 1.1.
- 5) The new software will install drivers for both cards. In fact, the AppleTalk Network Software Installer disk that ships with the card will also install drivers for Apple's Ethernet LC and Ethernet NB cards, as well as the latest version of AppleTalk. This will make it easier for network administrators to manage software for AppleTalk networks because it's all in one place.
- 6) Yes. Use the MacTCP Token Ring Extension.

SNA•ps 1.1: Allows Font and Orientation Selection

=====

Article Created: 6 January 1992  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

Does SNA•ps 1.1 printing let me specify the orientation and font for host jobs?

DISCUSSION -----

The user manual for SNA•ps 3287 tells you how to print data that is wider than the page to a LaserWriter. Use the Landscape option in the printing dialogue at 76 percent to allow printing 132 columns by 66 rows. This is the normal 3287 printer paper size.

The "Use custom formatting" option in the Session menu lets you to choose font, size, lines/inch, and other parameters to get the output format as close as possible to your ideal.

Print preview, in the Session menu, lets you preview your output in a separate window.

The font that ships with SNA•ps 3287, called Noiro, is designed to mimic the look of IBM fonts; the custom formatting and preview options should enable you to diverge from the IBM look.

TOPIC -----

Using AppleShare 3.0 on a Quadra 900, I want to convert the Users & Groups file from a 2.0 server. Putting the old file in the new server's folder isn't sufficient. How can I get AppleShare 3.0 to recognize the old file?

DISCUSSION -----

We suggest you follow this procedure:

- 1) Move the Users & Groups file from the Preferences folder to the root level.
- 2) Put the old AppleShare 2.0 file inside the System Folder, but outside the Preferences folder.
- 3) Run the Admin program.
- 4) Enter a new password when the program prompts you for a new Administrator password.

That should convert the old file to the new format.

AppleShare 3.0: Can't Log On to the Same Server Multiple Times

=====

Article Created: 2 January 1992  
Article Last Reviewed:  
Article Last Updated:

TOPIC -----

I would like to log on to a single AppleShare server, signing on with user name and password to a user's private data volume, but have them log on as "Guest" to a general application volume. The employees here move around to different Macintosh computers frequently, and would like to have a consistent method of accessing information. They have to get to their own "home folders" where ever they are over the internet, but would like to always access an application's volume from the closest local server. Having Guest access available on this computer considerably reduces administration overhead. However, if a user connects to the local server as Guest for an application volume, and their personal "home folder" is on that same server, they can't log on with a different user ID.

Is there any way around this?

DISCUSSION -----

It isn't possible to mount different volumes of a single server with a different user ID and password using AppleShare 3.0. This is a difficult approach using AppleShare 3.0, since it's possible for a physical volume to have multiple mounting points for users, and folders can be share points.

We suggest that users mount their "home folder" first. Then if they need access to a Guest folder on the same server they can easily add it to the existing mounted volume without logging off.

Another possibility is to make each "home folder" user owned. The other folders should have Guest access. When a person logs on as a registered user, they'll also have access to Guest folders.
